Printed in France

This is the second in a series of manuals on various aspects of population communication. It is designed for use in training communicators and educators working at various levels in national population programmes. The need for such a work has long been felt.

The present manual is based on the recommendations of the Expert Meeting for Developing Guidelines for the Evaluation of National Family Planning Communication Programmes, convened by Unesco in Davao City (Philippines) in April 1974. It is related to three technical documents and a film. The documents, published by Unesco in the series 'Population Communication: Technical Documentation', are the following: Communication Research in Family Planning An Analytical Framework; Research in Family Planning Communication; Evaluation Research on Family Planning Research.

The film, Research and Evaluation, was produced by Unesco in the series Films on Family Planning Communication. A list of these training materials may be found at the end of this book.

It is recommended that the manual and related materials be used as a package in training programmes.

The views expressed in this publication are those of the author and not necessarily those of Unesco.

#### THE AUTHOR

Robert Gillespie obtained family-planning communication experience by working with mass-media programmes in Taiwan, Hong Kong, Bangladesh and Iran.

After working for Pathfinder Fund in 1962 and 1963, Mr Gillespie joined the Population Council and worked primarily in Iran, Turkey and Taiwan. He is Chairman of the Board of Population Communications and currently Director of Special Projects for the Population Crisis Committee. He has been a consultant for the World Bank, the United Nations Fund for Population Activities (UNFPA), the United Nations Educational, Scientific and Cultural Organization (Unesco), the World Health Organization (WHO), Ford and Rockefeller Foundations, United States Agency for International Development (US-AID), the Swedish International Development Authority (SIDA) and for several governments in Asia.

0

1

This manual is intended for use by family-planning staff in administrative, communication, training and evaluation work. No manual will fit the needs of all family-planning communication programmes. The manual should be read, modified to satisfy local needs, translated and distributed to the national and provincial communication and evaluation staff. After communication and evaluation priorities are assigned, a plan of action should be developed, specifying samples needed, number of forms or questionnaires to be mimeographed, training to be given to interviewers, field interview strategy, methods of coding and editing the data, tabulating and analysing the results, and finally actions to be taken based on the findings.

This manual attempts to provide simple guidelines for communication evaluation, including the forms or questionnaires that could be used, and tabulations. The manual has been developed with the following specifications:

The questionnaires and forms can be easily adapted to most national and provincial family-planning programmes.

Communication efforts need to be evaluated within the context of an existing contraceptive technology.

Research and evaluation studies have yielded some specific guidelines on what to say to whom and how to use field-workers.

The interviewing and tabulations can be done by existing evaluation, clinic, mobile unit and field-worker staff.

The staff time required for evaluation should not interfere with ongoing or planned communication activities.

Within six months of receiving the manual, communicators should know better what to say, to whom, when, through which channel and with what anticipated effect.

Those in charge may think that they do not have sufficient staff to carry out a comprehensive communication programme or have it adequately monitored. However, field and clinic staff usually have ample time to collect and tabulate the necessary data for proper

#### A manual on evaluation of population communication programmes

evaluation. There are slack hours at the clinic during which staff could collect or tabulate the data required for adequate evaluation. The estimated number of man-hours are calculated in this manual. Field staff often conduct follow-up visits and could easily ask many of the media-exposure and other questions that would help to determine the effectiveness of the ongoing programme and a potential communication strategy. Clinic staff providing maternal and child health services could set up a procedure for pre-testing some of the family-planning messages and other materials. Given the infrastructure of staff in most familyplanning programmes, there is no need to hire any additional personnel to achieve all the evaluation objectives described in this manual.

NOTES

# Defining your responsibilities and priority communication needs

#### Defining your job descriptions and responsibilities

Before a communications programme can be adequately evaluated, each staff member at the national and provincial levels should have specific job descriptions. Once the job description is specifically defined for each member of the communication and evaluation staff, a plan of action for communication evaluation can be designed, assessing the priority needs and determining the objectives. After reviewing and modifying the instruments suggested in this manual, specific courses of action can be determined.

#### If you are a programme administrator . . .

Have you received and reviewed a specific communication evaluation plan of action?

Have you drafted job descriptions for all the communication and evaluation staff?

Have you conducted a fact-finding survey in order to gain a better understanding of the communication and evaluation structures?

Have you designated specific communication targets such as the proportion of couples in the reproductive age group who should be

familiar with a specific family-planning slogan?

Have you designed a plan of action for developing an awareness of population problems among elite groups?

Do you know if the communication at clinics and depots is geared to the needs of couples requesting contraceptives or sterilization?

Have you assigned operational and acceptance targets to field-worker supervisors and field-workers?

Have you developed communication and education plans for the staff in the Ministries of Education, Agriculture, Labour and Health?

#### If you are a communication specialist . . .

Do you have a communication plan of action for each month during the next year? Does the strategy include a well-balanced use of personal communication, folk and mass media?

Have you assigned job descriptions for your communication staff? Have you conducted a fact-finding survey in order to gain a better

understanding of the ongoing communications efforts in your area? Have you worked with the evaluation staff on a family-planning slogan or theme?

Have you contacted advertising agencies and market research firms to determine how they can be used in promoting family planning?

- Have you contacted the Ministry of Information and Broadcasting, or radio station managers and newspaper publishers, to determine how family-planning advertisements, radio spots and news releases can be developed during campaigns and integrated in the ongoing communication programmes?
- Have you determined the effectiveness of the clinic education programmes?
- Do you replace and retrain field-workers or their supervisors who do not reach specific acceptance and continuous-use targets?
- Do you plan to involve agricultural extension agents, schoolteachers, village leaders, midwives and other influential persons in your communications programme?

If you are an evaluation specialist . . .

What plans do you have for evaluating the communication programme? What data collected by the field-workers or clinic personnel could be utilized to evaluate the ongoing programme?

- What fact-finding have you done of existing evaluation work in the health field or by advertising agencies? How can the evaluation findings of existing development and communication programmes be applied to family planning?
- Have you talked with advertising and market research firms to find out what packaging, slogans and sales pitches have been most successful in selling products? What pre-testing, listenership surveys and media exposure surveys have been conducted and what guidelines are there which would be useful for developing a family-planning communication strategy?
- Do you distribute monthly and annual reports on the effectiveness of the ongoing programme to the communication and administrative staff?

12

What plans do you have for pre-testing the existing communication materials?

- Have you conducted a baseline survey of knowledge, attitude and practice of family planning and gauged the public's exposure to media and personal forms of communication?
- Do you know each month which field-workers and supervisors are achieving their acceptance and continuous-use targets, and have you analysed the characteristics and working procedures of the best field-workers?
- Have you determined what the elite know about population and the family-planning programme, and what their specific participation in a communication programme could be?
- How effectively have you monitored the participation of various community organizations, folk media and opinion leaders in support of the family-planning communication programme?

If you are responsible for training doctors, nurses, midwives or others providing contraceptive services . . .

Has your training programme stressed the importance of recommending contraceptives according to the needs of the couples?

- Have you evaluated your training programme in terms of the information and services given the family-planning acceptors?
- Does your family-planning training programme cover role-playing and other efforts to develop an empathy between the patient and the individual providing the service?
- Have you developed any evaluation techniques to determine how long women coming to the clinics wait, how far they have to travel to the clinics, whether contra-indications are properly diagnosed, and whether instructions on the methods are adequate?
- What ways do you have of obtaining negative information about the client's reactions to contraceptives and what evaluation do you have of communication efforts to reassure women who have side-effects with the contraceptives?

If you are a field-worker supervisor . . .

What evaluation do you have of your field-workers in terms of their reaching specific new acceptance and continuous-use targets?

Under what conditions do you replace field-workers who do not achieve their targets?

What are the home visit and group meeting working procedures and

1

0

what are the characteristics of the best field-workers in terms of education, age and practice of family planning?

- Have you evaluated the best communication approach at home visits and group meetings?
- What type of in-service training do you provide the field-workers for whom you are responsible?
- How often do you visit the field-workers and in what way do you evaluate your own in-service training?
- What information do you feed back to the communication officer or the administrators of the programme in terms of the field-workers' problems and ways in which the communication programme can be improved?
- Have you evaluated the communication materials provided to the fieldworkers?
- How has the mass communication programme supported the activities of the field-workers, and what evaluation do you get from the fieldworkers on the effectiveness of the mass-media programme?
- In what ways do you assist the field-workers in obtaining community support? Specifically, have you arranged meetings between the field-workers and local community organizations, such as farmers' associations, meetings of teachers and parents, or village councils?
- In what way do you co-ordinate the use of indigenous folk entertainers and festivals with the field-workers' communication activities?

#### Defining the priority needs in communication evaluation

In order to define the priority needs for your communication evaluation, your plan of action should be based on the following criteria:

- Are there existing data collected by the field-workers and at the clinics which have not been tabulated and analysed? Could these data be useful in determining the effectiveness of the field-workers, the clinic staff or the mass communication effort? If so, could you develop a plan for analysing the data with existing staff?
- If the field-workers do not have specific acceptance targets and are not being replaced if they do not attain these targets, targets should be given priority as far as the field-workers are concerned.
- If the communication personnel or evaluation staff have not conducted a fact-finding survey of the existing infrastructure of facilities and personnel that could be used in a communication programme, this should be done immediately.

#### Defining your responsibilities and priority communication needs

- If the clinic staff or field-workers are not providing complete and adequate information on contraceptive methods according to the needs of the couples, then this should be evaluated and improved as soon as possible.
- If the current slogan and messages used in the leaflets, posters and other educational materials are not accurate and have not been pre-tested, they should be revised.
- If the mass-media campaigns or ongoing programmes are not making a well-balanced use of existing media infrastructure and do not reach a target of 80 per cent of the couples in your province or country, then the current mass-media strategy should be revised immediately.
- If provincial groups, business and government leaders are not aware of the national population policy or potential population problems as they affect their activities, then a communication programme should be designed and evaluated to develop an awareness of the population problem.

No two countries or provinces will have the same priority needs. The most important need at this time is to review the strategy of the ongoing communication programme and determine a communication and evaluation plan of action that will achieve maximum results in terms of new acceptors and continuous use of the methods and to help couples develop a rationale for the spacing of children and number of children desired.

## What you should know about your country or province

#### **Communication fact-finding**

Most communicators and evaluators are not aware of the physical facilities, communication manpower and data that are available to them. Before an adequate communication and evaluation plan of action can be drawn up, a complete understanding of the infrastructure of communication channels should be undertaken. A fact-finding questionnaire is set out in Appendix 1 for this purpose. By answering the questions outlined in the questionnaires, you can better determine the following communication structure:

What is the structure and function of the mass media in the public and private sectors?

What elite groups exist?

What clinical and medical facilities exist?

What is the potential manpower for field-workers and supervisors?

What folk media exist?

What production facilities for printing and developing audio-visual materials exist?

#### Communication evaluation fact-finding

A large number of advertising and communication programmes have been going on inside your province or country. Through the mass media and salesmen, the public is being made aware of products that they can buy. In the health, agricultural and educational fields, the government is trying to improve the standard of living for the individual and communities. By contacting persons who have been responsible for these communication campaigns, you can determine how they have been evaluated and what communication approaches have been most useful.

Advertising, market research and sales organizations can inform you

#### A manual on evaluation of population communication programmes

about what types of advertisement have been most successful as well as what types of sales technique. They can also inform you about the emphasis that should be given to various types of media available in your area and with what anticipated effect. Several advertising firms have conducted listenership and media-exposure surveys. From these surveys you can determine what individual radio stations, at what times, should have radio spots and what advertisements the printed media require in order to reach specific audiences. If you can give the advertising agencies the characteristics of the target population you wish to reach and the nature of the contraceptive information that you are trying to communicate, they can provide ideas about ways of promoting family planning.

While talking with advertisers, you should find out how family planning can be tied in with the ongoing communication campaign. Will advertisers associate their products with small families? Can the sale of kerosene, soft drinks and other products be combined with the sale of condoms and resupplies of oral pills?

Many health programmes involving malaria control, vaccination and nutrition have used a combination of mass-media and group education techniques. By ascertaining what strategies have been applied by personnel conducting health-education campaigns, you can obtain guidelines regarding the appropriate balance to be struck between media and personal communication, as well as the type of messages and appeals which have been most successful.

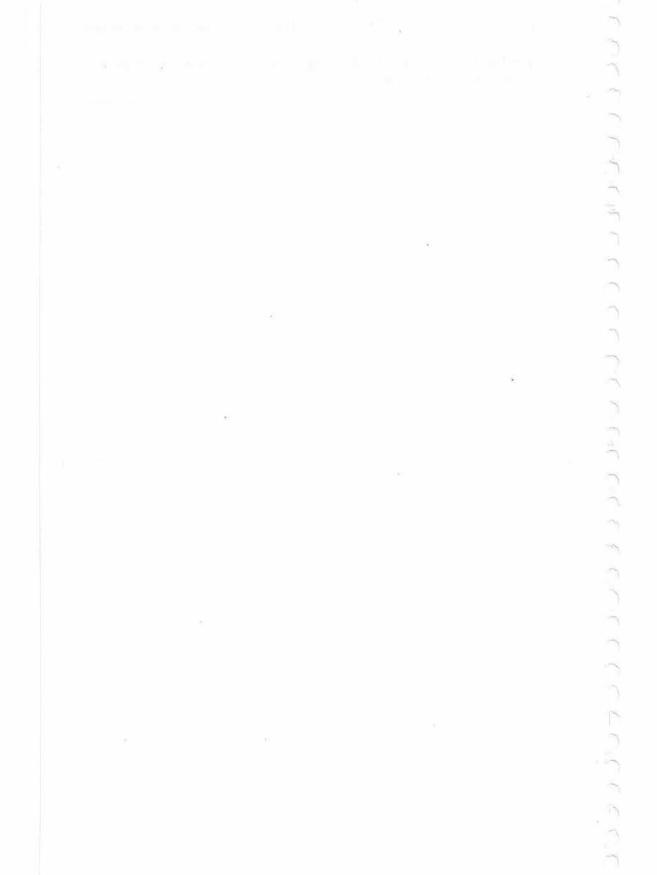

Agricultural extension agents have also been involved in getting farmers to adopt new agricultural procedures. By talking with the director of agricultural extension services, you should be able to get some useful ideas on how family planning could be integrated into the agricultural education programme and what extension education techniques have been most successful. Another area of education that has been innovative is functional literacy programmes for adults and adult-education programmes. Determining how these programmes have helped satisfy local training and vocational needs would be valuable. Is there the potential for combining population, contraceptive and familysize information within the context of ongoing functional literacy, agricultural extension and health-education programmes?

Family planning needs to be communicated within the context of needs felt by the individual and the community. You should find out whether there are studies that have measured parents' aspirations for their children, and for themselves; what some of the needs felt by the community are, and how the population and family-planning messages can be related to these needs. A communicator or evaluator should ししししてく

#### What you should know about your country or province

spend at least two months studying the actual communication process in his area, as outlined above.

NOTES

4

-

2

### Evaluating the ongoing familyplanning communication programme

#### Assessing the value of your own activities

Do you currently have a communication programme which can be evaluated? There are several ways of evaluating what you have done: Have you achieved the results that you had set out for yourself when

originally taking on the assignment as a communicator or evaluator? Are you obtaining the level of communication activities or evaluation data that you had planned for originally?

Have the personnel who are responsible to you produced the results that you had set out to achieve and have you evaluated them in the light of specific job descriptions, targets and production schedules?

Have you analysed your achievements using cost-benefit criteria and, if so, what is it currently costing you to achieve measurable results, given such indices as number of field-workers trained, amount of data analysed, tabulated and fed back, materials produced and distributed, etc.?

Have you spent at least one-third of your time travelling in your province or country to determine the effectiveness of the communication effort? Have you talked with men and women in the reproductive age group, as well as with field-workers, clinic staff and other personnel in the programme?

What evaluation indices do you have to measure your programme and how have you modified it based on findings from field studies or field reports?

Most communication and evaluation staff could not rate themselves very high using any of these criteria. There is very little contact between the person responsible for the programme and the field level staff. Few communicators receive any negative feedback from field-worker supervisors, clinic staff or the public.

#### Collection and evaluation of communication materials

You should collect all the posters, leaflets and other materials that have been produced within your country on family planning. Without any additional pre-testing you can evaluate these materials using the following criteria:

- Are these materials honest? When describing the IUD, do they explain the possible side-effects, such as bleeding, headaches and other problems? Do they explain that women taking the pill and not wanting any more children are expected to return to the clinic once a month and take pills every day for as many as ten to fifteen years? Do they explain that 50 per cent of the women using the IUD and up to 70 per cent of the pill acceptors discontinue after two or three years? Do they explain that sterilization operations are generally irreversible and that men should use a contraceptive up to four weeks after the operation?
- Is there a symbol or slogan that is reproduced on all the communication materials? Is the symbol easily identifiable and reproducable?
- Do the posters and visuals communicate a specific message? Can the poster be understood by an illiterate and can all the writing be comprehended by a person who would be passing by the poster?
- Do these materials explain the contraceptive? Do they refer to a specific size of family? Do the materials have easily understood instructions on how to use the contraceptives? Is the value of the two- or three-child family related to specific benefits to the children or their parents?
- Do the materials explain where to go for contraceptives or how to obtain further information?

You should determine what are the existing printed material inventory levels at the national or provincial headquarters and at the various distribution points. An inventory policy should be based on how many items are needed over a given period of time. The field-workers or stock-room clerk should never let supplies drop below the estimated needs during a four-month period.

If the materials are honest and provide sufficient information and are being effectively used, then you should determine which items should be given emphasis. Usually simple and inexpensive one-page leaflets are easier to distribute and just as effective as pamphlets. You should consult the field-workers on their views. By simple field investigation you can evaluate if the posters are being torn down after they

#### Evaluating the ongoing family-planning communication programme

are placed on the walls, if the leaflets and pamphlets are being distributed and read, and if the field-workers are using flip charts, pelvic kits and other materials supplied to them. In developing a plan of action, you should assign priority to the least expensive materials that reach the largest population. For evaluation purposes you may want to have the field-workers put a designated number on each leaflet or pamphlet they distribute. By counting the leaflets that are returned at the clinic at the end of each month, you can determine which field-workers or community organizations have distributed the greatest number of leaflets to the acceptors.

#### Assessing your ongoing programme

If the answer is 'no' to any of the following questions, then you should review and possibly revise your ongoing family-planning communication strategy:

Have you thoroughly investigated the structure and function of communication strategies in your country or province?

Does the mass-media programme reinforce and support the field-worker, clinic staff and others trained to provide family-planning education?

Are the field-workers selected from the areas where they work, given specific recruitment targets, assigned a specific area to cover, and are they similar to the couples whom they give information to in terms of age and marital status?

Do you utilize experience gained in the private sector in helping to advertise and distribute contraceptives?

Do you integrate family-planning communication with ongoing developmental communication support activities?

If there is significant folk media entertainment, do you utilize this medium in your communication strategy?

Does your budget and personnel used in mass-media campaigns reflect the effectiveness and audience exposure of individual media?

Are national, business, professional or governmental leaders aware of the implications of rapid population growth as it affects their activities?

Are the contraceptives chosen by men and women best suited to their needs for spacing or stopping pregnancies?

-

22

How to pre-test the slogan, message and printed materials

#### Developing a symbol or slogan

5

-

5

All communication programmes should have a symbol and a slogan. Most national family-planning programmes have a symbol and a few have a specific slogan attached to the communication efforts. The symbol and the slogan should be placed on all printed materials and the slogan should be broadcast with every family-planning message. The qualities of a good symbol can be summarized as follows: (a) it should be easily identifiable; (b) it should be simple to replicate; (c) it should be simple in design; and (d) there should be some frame of reference.

The slogans in some countries emphasize a specific family size, usually two or three children. Whatever the slogan, it should be specific by relating to the contraceptives and/or family size. Preferably, the slogan should rhyme and be backed up with a recognizable sound symbol. A local instrument supporting the slogan with each radio broadcast or film clip is very useful. By identifying the symbol and slogan on all communication materials and at all distribution points for contraceptives, such as clinic and depot centres, the communication effort is tied in with the provision of services.

To determine the best slogan and symbol by pre-testing can be very valuable. Pre-testing can also give you an indication as to which additional themes or messages should be used in describing the contraceptives, the value of the small family and ways to overcome current resistance to the contraceptives and sustained practice. Even after pre-testing there is usually no one slogan or message that is going to satisfy the number of communication inputs that you will want to achieve.

#### **Pre-testing messages**

The first objective in pre-testing is to determine the slogan and the

#### A manual on evaluation of population communication programmes

visual that will be used. Write down on a piece of paper the existing slogans and messages that are used in the ongoing communication programme. Write down any additional messages that you think should be pre-tested. These messages or slogans should not be longer than one sentence or at the most two short sentences. Place these messages on cards so that they can be read by someone seeing them within a onemetre range. Divide the messages and themes into groups of four.

Choose the sample population that you wish to pre-test these messages with. You must first determine who is to be the target audience. Generally, men and women similar to the existing familyplanning acceptors who are going to the health stations provide an adequate sample. A group of men and women chosen at random on the maternal and child health (MCH) staff or someone else in the health centre will generally be adequate for pre-testing purposes. A rough indicator of the way to select the sample as pre-test subjects is to choose men and women between 25 and 35 years of age who have three or four children. Most family-planning acceptors come to clinics not wanting any more children and already have five children. However, it is also useful to pre-test the messages for those who wish to space pregnancies. If 100 men and 100 women are used as subjects to pre-test the slogans and messages suggested here, it would take two clinic personnel working fifteen hours to complete the interviewing and another fifteen to twenty hours for tabulations. With only 200 men and women you should be able to get distinct preferences and indicators as to the best slogans and messages. Two hundred subjects is also an adequate number for posters or visuals; for radio spots or leaflets 100 subjects should do.

Appendix 2 contains an introductory form and baseline questions that should be given all pre-test subjects. Appendix 3 is a series of messages which could be pre-tested, with a diagram showing how to tabulate the results. After the baseline questions are asked, the women or men are shown the cards; if illiterate, the slogan is read to them. The cards should not be held up for longer than three seconds and only four cards should be used at one time. After the subject hears or reads the four cards, he (or she) is asked which slogan he likes the most, and which one the least. This information is then recorded and the interviewer goes to the next four cards and repeats the process. In pretesting sixteen messages, the four messages liked the most or the four liked the least are then drawn out of the four packages. The subject is then asked to state which four messages he liked, which one he liked most of all, and, of the four they liked least, the one they liked least of all. After this is accomplished, the subject is then asked to state if he or she believes any of the messages are dishonest, and these are then recorded. Another important criteria by which to determine the preferred message is to ask the women or men: 'What information would you most like to know before accepting a contraceptive?' and 'What information is most relevant for you when deciding on a specific size of family?' This rather simple testing to ascertain preferred slogans or messages can be very useful in determining which one you would like most to stress.

#### Pre-testing the visual or poster

All communication campaigns should have a visual representation of the pre-tested message. The pre-testing of visuals is very similar to the above. A series of posters are shown to women representing various family-planning themes. The poster pre-testing questionnaire (Appendix 4) can be used for this purpose. Four posters are shown and turned down every three seconds and the woman rates which one of the four she likes the most. The posters can be further evaluated by the colour, composition, lettering and specific descriptive details. Preferably, the visual representation of the family-planning programme should show the contraceptives and explain where a person should go for further information or supplies.

#### Pre-testing radio spots

Pre-testing radio spots using a tape recorder is somewhat artificial but can be done. Each radio spot is played individually and the subject ranks the spots using a rank order sheet on which there are four squares (see Appendix 5). For each radio spot, he or she records whether it is very good, fair, poor or bad. The subject can also rank it according to whether he or she thinks it is completely truthful, mostly truthful, partially truthful, or not truthful. After the radio spots are played, the subject is asked which one was liked the most and which one the least. There should always be an even number of choices to rank the radio spots or other materials. The median usually expresses a bias in rank order test.

#### Using the findings

With each of the appendixed pre-test instruments, there are tabulation sheets. After the data have been tabulated, the findings can be used in the following manner:

27

3

200

27

-1

-

0

5

2

To determine what slogan should be used in all communication efforts. To determine which are the strongest motives for a small family.

To determine the perceived disadvantages of the contraceptives.

- To determine what messages can reinforce the principal slogan used in the campaign.
- To determine what visual slogan should be utilized to support the communication programme.

To determine what radio spots have most potential effectiveness.

Pre-testing should not only help in the choice of printed materials and mass-media programmes; the messages and posters should be reinforced by field-worker, community, clinic and elite education.

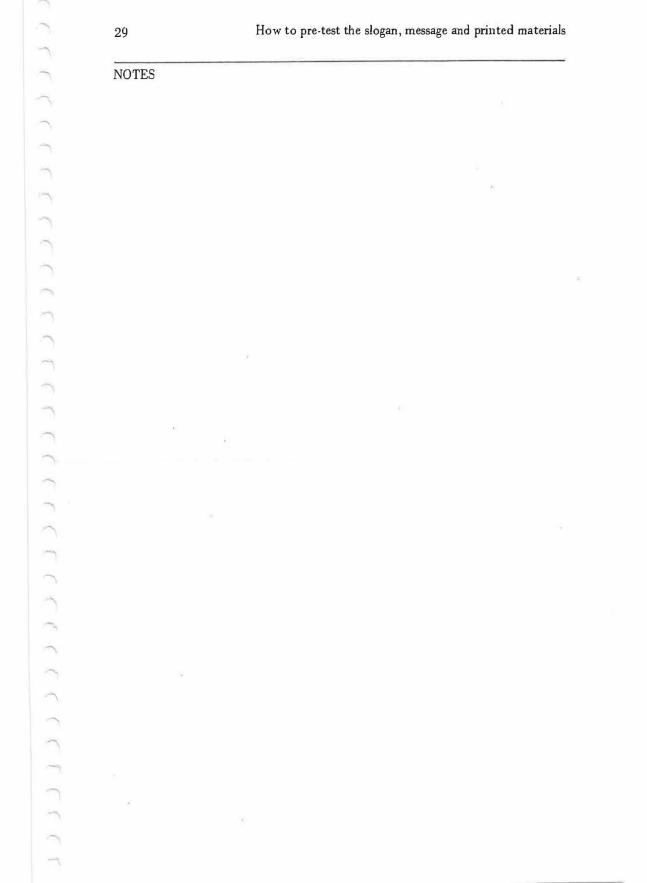

Your communication programme should fit the following specifications:

You should have only one slogan and visual on all printed materials and broadcasts in all the media during any given campaign.

The slogan and poster should be visualized by any person walking down the main street of a large city.

A quick spot check by the field-workers and clinic personnel should show that the slogan is familiar to 80 or 90 per cent of all men and women within three months after the communication effort has started.

The pre-testing suggested here is easy to accomplish but it is somewhat artificial. Ideally, radio spots should be pre-tested as soon as heard on a radio, and posters after someone has just passed one or several in the streets. However, most natural setting pre-testing is rather difficult.

-5

### How to evaluate the mass-media campaign

#### Evaluation of the ongoing programme

You should first have collected the data on the media infrastructure, determined what types of campaign have worked in the past, and pretested the slogan and visual. Appended is a pre-campaign survey form (Appendix 6) which could give you guidelines on which media to emphasize if media exposure surveys have not already been conducted. The survey also contains some questions for obtaining a baseline of existing knowledge about attitudes towards and practice of family planning. In most provinces and countries there are household surveys being conducted by statistical centres, university and plan organizations. Usually, small areas such as villages or urban clusters are stratified by population size, and then a sample of these areas within each stratum is selected by random sampling. Within each area, the households or houses are all listed and a sample of households is selected systematically at random. You should consult with a local sampling expert in designing the most efficient, scientific sample for your area. A sample size of 500 is adequate for only the simplest analysis; for more complex analysis, the sample size should be at least 1,000, depending on your needs and the estimated sample variation of what you are studying. If there are not more than 500 questionnaires to be completed, then ten field-workers can complete the interviewing in one month, assuming available transportation. You can use the questionnaire as a model. You can calculate the marginal tabulations in three weeks. One key puncher could put the information on cards in ten hours. Only two questions need to have code instructions developed. The coding and editing takes only seven minutes per questionnaire. On the margin of the questionnaire are the designated card and column numbers. The codes can be punched directly from the questionnaire.

#### Media emphasis

Without any media exposure studies or fact-finding, it is known that the radio is the most important medium. In populations with low literacy, say below 30 per cent, a rough guideline to follow is that half the cost and effort of a communication campaign should be put into radio spots and integrated programming. Further experience with mailing systems has shown that even where men and women are illiterate, they have mailings read to them. Even if there is only a 50 per cent registration of births, most countries could afford mailing information on family planning to women who have had a recent birth. Although newspapers and magazines are read by a more sophisticated audience than the general target population, advertisements, newspaper inserts and news releases have proved effective in most campaigns. Most countries have either slides or film clips shown in cinemas and, although initial production costs may be high, the cost per audience reached using slides and film clips has proved to be relatively inexpensive in the long run. There is rarely a rationale for producing 16 mm films if they are not shown in the public cinemas. If there are mobile units showing the films to large audiences, then the cost may be justified. However, audio-visual units are also very expensive and must reach a large population to be useful. Most mobile units can be expected to last seven years. If a driver, health educator and field-worker are assigned to the unit and spend twenty days a month in the field, then the cost is about \$18 per day. This assumption is based on a staff cost of \$180 per month, the fuel and repairs are \$60 a month and the vehicle costs \$10,000.

#### Evaluation instruments and procedures

The evaluation instruments used to measure the impact of a familyplanning programme are useful for research purposes and should not be used on a national programme scale. The post-campaign evaluation survey (Appendix 7) can be used to measure changes in family-planning knowledge, attitudes and practice and gauge the individual effectiveness of specific media. A sample of 500 people chosen in a similar way as the baseline survey, but with a different group of men and women, could be used. The time to conduct the survey and tabulate the results would also be similar. To achieve immediate feedback for the ongoing campaign, the evaluation staff could use man-in-the-street interviews, diary takers, post cards and coupons as well as telephone responses. UN ( ( 1

The man-in-the-street interview is simply used to ask persons coming out of the cinema if they remember the family-planning film clip and if so, what they remember. Likewise, persons having passed a poster or exhibit could be asked what it is that they remember. There is no attempt at sophisticated evaluation, only quick feedback as to the effectiveness of the individual media.

A coupon could be placed on all printed materials, including newspaper advertisements. The coupon might bear a mark indicating in what medium it was placed and suggesting to potential respondents to take the coupon when going for services. By a return of the coupons from mailings, leaflets, advertisements and other materials, the evaluation staff could determine which media source was most effective. Some coupons might have the addresses or maps of the local clinics, or could be sent to a specific address for condoms or a booklet on contraceptives. To increase the effectiveness of coupons, they might be stamped with an expiration date providing free services for a limited-time-only, or they could state: 'The first one hundred persons to return the coupons will get free milk for their children.'

On the radio spots as well as the printed materials, there can be a telephone number to call or box number to write to for further information or contraceptive supplies. A request to the public to call the telephone number or write to the box number can be used to obtain negative information about the campaigns as well as information on individual problems that need to be solved. The person answering the calls should record daily the number of calls, the sex of the caller, the questions asked and the information provided.

One of the best ways to measure the word-of-mouth communication that is generated by the mass media is to have literate persons write down what they hear people discuss about family planning generally and the campaign specifically. A diary of these discussions provides an interesting indication of public opinions about the programme, both good and bad, and reactions to the campaign. The diary taker should note daily the sex of the discussants and where the conversation took place.

If at the clinics or depots where contraceptives are offered the visitors are asked to give all their sources of information, where they heard about family planning and which was the most influential source of information, an analysis of this trend by month can help determine the effectiveness of each component of the programme. Finally, trend analyses can be used in two ways. First, the number of new acceptors and continuous users can be charted for a period of three to six months before the campaign begins, during the campaign, and after the

#### A manual on evaluation of population communication programmes

campaign. By analysing the trend in acceptances over and above what would have been expected during and after the campaign, the evaluator can assess the effectiveness of the programme. A graph of the new and return visits during the same period of time for provinces, with similar populations and contraceptive services, but where no campaign was carried on, may provide useful comparisons. At the national level, competition between provinces or districts can be generated by keeping the various communication officers informed as to where they stand in reaching targets in relation to other provinces. Comparisons between provinces or districts must take into consideration population size and distribution, the availability of contraceptive services and media infrastructure.

#### Developing a continuous communication and evaluation programme

Campaigns can be useful in determining what media mix or media emphasis should be used in the ongoing communication programmes. After conducting the post-campaign survey, the cost per 1,000 people reached by each medium should be estimated. The recurrent budget for the ongoing programme should take into consideration the characteristics of the target population such as age, sex, literacy and location as well as the effectiveness of the individual medium. Usually radio is more effective than printed materials such as newspaper advertisements. The use of simple cost analysis, advice by advertising agents and other communicators, and common sense, should lead to a well-balanced communication programme. The slogan and visual should be combined with the symbol on all media used. The pre-tested messages should be reinforced by constant repetition in all media.

Each month a report by the communication staff should be sent to the national office, indicating the number of radio spots, news releases, mailings, and other routine communication efforts that are performed. The report should include an inventory of materials that are needed at any given time by the field-workers and other persons distributing the materials.

There should be a continuous visualization of the slogan and theme, even during non-campaign periods. A principal objective should be to have family planning visualized by stencilled paintings, banners and/or posters. The evaluation and communication staff could allow a slack period in the general level of activities during the two or three months preceding a campaign when time is needed for the preparation for a

# How to evaluate the education of elite groups

### The objectives of elite education

National leaders may not be aware of the population policies of their own country, the effects of population growth and structure on their specific activities, or the progress and developments in the familyplanning programme. Improved communication with elite groups should lead to greater support for family-planning programmes and provide a rationale for revising abortion, sterilization and minimum-agefor-marriage laws. Some of the problems preventing full utilization of family-planning technology can be summarized as follows:

Family-planning programmes are usually structured at a low level in the Ministry of Health but with proper policy support these could be developed into an autonomous organization, utilizing the resources of all ministries.

Leadership in many family-planning programmes has been very weak; an effective elite communication programme could develop a better leadership structure.

Contraceptive services have been hampered because of under-utilization of paramedical personnel to insert the IUD and prescribe oral pills, and inadequate distribution of condoms and fresh supplies of oral pills in the villages. A communication programme could help to promote the use of paramedical personnel, depot distribution and commercial marketing systems.

Without legislation providing for medically safe abortions when women fail to use the contraceptives given to them, it is difficult to enable women to have children only when they want them.

Some 60 to 80 per cent of all men and women coming to the clinics want to put a stop to pregnancies. The elite should be informed of the need to provide sterilization services.

Family-planning communication programmes have been hindered by inadequate support from the private and public sectors controlling broadcasting, publishing and advertising institutions.

Many countries still have restrictions against the advertising of contraceptives.

A communication programme with elite groups should help clarify the issues or resolve the problems. Such a programme might cover some of the following subject areas:

- Most leaders in both the public and private sectors are not aware that populations will double in almost all developing countries no matter how intensive or effective the family-planning programme may be.
- Most ministries and government departments are not aware of how population growth affects their specific activities or how they could integrate population and family-planning communication into their own programmes.
- There is a prevalent myth to the effect that population and familyplanning efforts come from the developed countries.
- Most national leaders are not aware of the fact that between 20 and 40 per cent of all women in their countries are having unwanted pregnancies and that family planning can be an effective means of improving maternal and child health.
- The elite groups are generally not aware of the ongoing activities of the national family-planning programme and have not been requested to support the activities of that programme.
- The population problem is not generally perceived in terms of complex interrelationships between resources available within a country, environmental deterioration, rapid migration to cities, restrictions on women's rights and a high rate of infant mortality.

The principal objective in educating elite groups through familyplanning communication is to make them aware of the nature of the population problem and to provide specific courses of action that can be taken by changing laws and regulations or by direct participation in the implementation of the family-planning programme.

### Identifying the elite groups

At the provincial and national levels, the names and addresses of elite groups can usually be found in Who's Who, a government gazette or from a subscription list of the leading periodicals. Basically, the elite groups can be summarized as follows:

All ministers, under-secretaries and department heads of government agencies. At the provincial level this would extend to the district administrators, including agricultural extension agents, village leaders, schoolteachers, etc. The judiciary.

Legislators.

39

Professional groups such as doctors, lawyers, architects and engineers. Directors and presidents of large industries.

Publishers, directors of radio stations and the directors of advertising agencies.

National opinion leaders ranging from theatrical personalities to sports champions.

Religious leaders.

Speech-writers for politicians.

### Developing a communication strategy

After the elite's names and addresses have been recorded, a communication strategy can be designed. The family-planning administrator, communication director and evaluation staff should determine priority communication needs. Is there a need to obtain changes in government policy affecting the family-planning programme, or to develop an awareness of the population problem and family-planning programme? Should certain elite groups be given priority in the communication strategy? What will be the principal theme of the communication effort and the expected activities of the elite groups? How can the communication programme be effectively checked and evaluated? Should there be a pre-test of the communication messages? How can the existing support from elite groups, including the head of state or other influential persons, be brought into the communication programme? How can the communication effort be tied in with the communication strategy of field-workers, community education, mobile units, or other familyplanning communication activities? What evaluation procedures designed within the context of baseline surveys and pre-test instruments can be applied to an evaluation of elite communication?

A communication strategy may utilize one or all of the following procedures:

- Publication of statements explaining the population problem or supporting the family-planning programme made by the head of state or other influential persons.
- Organizing one-day meetings of the elite groups and discussing and reviewing population and family-planning activities. Formulating a systematic programme to combine family-planning communication efforts with planned meetings of provincial groups, sessions of parliament, ministerial meetings, or provincial political rallies.

- Establishing a monthly mailing programme to reach the elite. The messages can be related to a problem or event, such as energy and food shortage, employment problems or needs for education and health facilities.
- Identifying the newspapers and magazines commonly read by the elite groups and issuing news releases or writing articles for such publications.
- Preparing a questionnaire to gauge how aware elite groups are of population problems, and feeding back the findings to those groups.
- Soliciting letters from the public to support legislation in favour of population and family-planning laws and policies.
- Having leaders sign statements advocating the repeal of anti-abortion laws or the provision of better family-planning services.
- Getting public figures who have had vasectomies or abortions to give open support to these methods.

### Evaluation and monitoring of the programme

A quantifiable measure of an elite education programme consists of the number of public statements made and the release of such statements to the news media, as well as distribution through the mailing system. The staff should keep track of the proceedings of parliament sessions, the meetings of professional groups and decisions by the judiciary on laws and policies affecting the family-planning programme. The most important indices for evaluating the communication programme can be summarized as follows:

Have laws been passed or regulations changed governing the provision of abortion and sterilization services, the use of paramedical

personnel and the advertising of contraceptives?

- Have laws been passed and enforced regarding the minimum age for marriage, child labour, universal education, the provision of social security and the rights of women and children?
- Has any action been taken by elite groups to provide population and family-planning training in adult education and communication programmes? Has the personnel the elite are responsible for been requested to provide contraceptive services or recruit a designated number of acceptors?
- Has a questionnaire been formulated which measures the existing knowledge and attitudes of elite groups with respect to the population and family-planning programme as it specifically relates to their activities? Has any effort been made to determine what the

elite could do in the communication programme?

In Appendix 8 there is a questionnaire for the elite groups which attempts to develop a baseline of the awareness of the programme and asks questions which will provide an indication as to how they could participate in the programme. If the elite groups commit themselves to taking specific actions, then the communication evaluation staff would have a basis by which to measure their activities.

NOTES

# Evaluation of the field-worker's activities

### **Objectives of communication activities**

Most national family-planning programmes have a cadre of full-time field-workers who make home visits and conduct group meetings. In most countries, the field-workers are women because the principal forms of contraception, the IUD and oral pills, are used by women. Cumulative experience has shown that there are very distinct guidelines by which to select field-workers, train them, set up their field activities and evaluate their effectiveness. The communicator should ask the following questions and the evaluator should develop a strategy for obtaining the answers:

What portion of the field-workers should be men and how should they work with females in communication activities?

What portion of a field-worker's time should be divided between the health station or clinic, conducting home visits, group meetings or making follow-up visits?

How can a field-worker get couples to accept the most effective method for their particular needs?

What type of media support for the field-workers would be most effective and what leaflets, flip charts and audio-visual materials given the field-workers are most useful?

How is the evaluation of the field-worker's effectiveness and problems ' to be reported to the communication evaluation and administrative staff in such a way that it gives rise to specific action on their part?

### Guidelines for evaluation

There are some very specific guidelines from existing experience by which the communication programme by field-workers can be gauged. In selecting field-workers, they should be similar to the target audience they are trying to communicate with in terms of their age, education

and background. Field-workers should be assigned to cover a population of a given size which will usually vary, depending on the density of the population, from 15,000 to 25,000. They can be expected to visit all women in the reproductive age group in an urban setting within one year to eighteen months. A field-worker can normally conduct ten home visits a day and conduct two group meetings with fifteen to twenty persons a week. Generally speaking, the field-workers can be expected to recruit from three to eight new IUD acceptors, five to ten oral pill or condom acceptors, and one or two sterilization acceptors in a month, but this depends on the acceptability and availability of the methods. Whatever the methods are, the field-worker should be given both a new acceptor and continuous-use target. This can be done by giving her fifteen points for a sterilization, seven for a new IUD, five for an oral pill, three for a condom and one point for each return visit. To increase continuous use, the field-worker should set up four or five distribution centres for condoms and oral pills in her area. The fieldworker should have some form of educational materials such as leaflets on the contraceptives. The usefulness of film-strip projectors and other audio-visual aids has yet to be determined.

### Evaluation of the field-worker communication activities

Many programmes assign field-workers as temporary personnel so that if they do not achieve their targets, they can be replaced. Assigning the targets by which to evaluate a field-worker will vary depending on the availability and acceptability of the contraceptives, the total population and distribution of the population, the number of men and women currently practising or wanting contraception and the length of time a programme has been in operation. The evaluation director can determine the current level of referrals per field-worker and the return visits for contraceptives and assign a target based on what 70 to 80 per cent of the existing field-workers are currently accomplishing.

Most field-workers have a daily home visit form in which they record the name and address of the persons they visit, together with such information as number of living children, age of wife, current practice of family planning, and interest in accepting a contraceptive. Appended is a daily home visit form (Appendix 9) and a monthly record form (Appendix 10) which can be used to evaluate their activities.

The most accurate way to gauge which field-workers recruit a given number of acceptors is to use a coupon system. The coupons shown in

Appendix 11 have four parts. The first part is used to record the name and address of the person intending to practise a specific method. The second part is used for follow-up purposes. Three to six months after the coupon is issued, a field-worker can determine if the person accepted the method and, if so, whether she is a satisfied user and if not, why not; and what communication or change in programme activities are necessary to overcome her resistance. The follow-up section is sent to the evaluation staff at the end of each month. The third part of the coupon records the man's or woman's name, number of living children, education and address. The person wanting to practise family planning takes the third and fourth sections to the doctor or other person providing the contraceptive services. At the the time of the clinic visit the doctor fills in the information on the type of contraceptive given and if there are payments to the doctor or motivator, then the fourth section is used as a receipt form. When the payments are made, the third and fourth sections are collected and the centre section is used for evaluation purposes; the fourth section goes to the accounting office. Since each coupon has a number designating the individual who has issued the coupon, it is easy to trace who referred which acceptors each month. If the results for each field-worker are returned to them there is a built-in sense of competition between workers to achieve the targets assigned to them.

Evaluating the quality of the individual home visit or group meeting has been difficult. Some of the qualitative aspects of the communication evaluation process can be summarized as follows:

- Is the field-worker capable of stressing the methods in such a way that they satisfy the needs of the couples wanting to space or avoid pregnancies?
- Is there a joint commitment between the husband and wife in the process of making a decision about the contraceptive?
- How effective is the field-worker in developing community support for her family-planning communication activities?
- How does the field-worker develop an awareness of the population problems as they affect health, education and other local development efforts?
- How does the field-worker develop functional relations between the aspirations of parents and specific family sizes?
- How can she be honest in explaining the side-effects associated with the methods and at the same time build up acceptability and the discipline required to use the methods?

What promotion techniques, such as 'free offer for a limited time only'

3

9

3

3

3

3

5

7

-

and specific appointment dates, can she use in getting a commitment for immediate action?

- How does the field-worker diagnose and overcome culturally related resistance to family planning such as the role and status of women, subjects of discussion that are taboo, resistance of family members, the preferred need for at least two sons, as well as the real needs for children due to high infant mortality rates, support in old age and cheap labour?
- How can the field-worker communicate to the supervisors and administrators the type of problems that will lead to specific courses of action?
- How can the communication evaluation activities of the field-worker be combined with other evaluation needs such as baseline media exposure surveys, clinic education, community education and pretesting of materials?

With the proper utilization of the attached daily home visit and monthly record forms, coupons and questionnaires used by the fieldworkers, the evaluation and communications staff should know within five to seven months what types of field-worker activities have been most successful, which field-workers need to be replaced and how to develop a strategy for continuous field-worker communication and evaluation.

NOTES

# Evaluation of contraceptive service education

When men or women go to get their contraceptives, there is an additional communication activity. This will vary with the following conditions:

The legal or policy aspects allowing doctors and paramedical personnel to provide sterilization, abortion, the IUD, or to prescribe oral pills.

The effectiveness of the mass media, and field-worker or other community education programme.

The number of persons using the contraceptives in the community and their satisfaction and dissatisfaction with these methods.

The fact that motivation of a woman using the various contraceptive services will vary with timing of the last birth; the number of living children; the death of previous children; the number of living sons and their ages; whether she is breast-feeding; whether the decision has the approval of the husband; and other economic, social and cultural factors.

The desire to use the method to space the distance between pregnancies or to prevent pregnancies.

The training and experience of the depots, paramedical personnel, doctors, etc.

The time and effort required by the providers of services to educate the women and men.

The setting, such as the private doctor's office, the bedside in a hospital, the home, the group education at the health centre, the pharmacy or, if supplied by the depot, the retail store, barber shop, etc.

The educational support materials in the pharmacy or doctor's office such as counter displays, leaflets, posters or flip charts and pelvic models.

The salary and payment schedule for the doctors, depots or others providing the services.

The requirements, such as the husband's and wife's consent for sterilization, age of the wife and age of the youngest child.

The previous practice and use of contraceptives by the acceptor.

### Designing a communication strategy

A communication strategy for the personnel providing the services should take into consideration the following factors:

- What contraceptive methods are currently being emphasized and are the acceptors able to use those methods to satisfy their need to space or avoid pregnancies?
- What personnel can be used to communicate with the providers of services, such as the doctors who conducted the initial training programmes, detail men who explain drugs to the doctors, familyplanning field-workers or nurse-midwife supervisors or, in the case of commercial distribution channels, the wholesalers?
- What communication channels can be used, such as medical journals and direct mailings?

What medical standards will be maintained in the provision of contraceptive services, such as contra-indications for the IUD and pill? The following are possible guidelines for communication:

- Vasectomy should be offered to men who do not want any more children and whose youngest child is from 3 to 5 years old.
- Vasectomy is preferable to tubal ligation in all circumstances except where the female tubes can be tied as a routine part of a postoperative procedure.
- The IUD has a higher use-effectiveness for women who want to stop childbirth than oral pills or condoms.
- Oral pills can be prescribed by medical or paramedical personnel after screening women for whom there are contra-indications. If resupplies are readily available and free they can be effective for women who want to delay their first birth or space the distance between children. With early marriages, most women have three or four children before they are 30 years old. The oral pills have not proved effective for women who want to stop pregnancies altogether, due to the long periods during which the pills must be taken.
- Women who are breast-feeding can start taking low-dosage oral pills within six weeks after delivery, without a significant decline in lactation.
- If a women is menstruating and wishes to avoid pregnancy, she should be using a contraceptive.
- If menstrual regulation or early-term abortion is acceptable and accessible as a back-up for contraceptive failure, all forms of contraceptives can be recommended.

Many people have heard rumours about contraceptives and have fears that need to be overcome during the clinic education. Communication programmes should try to overcome certain common misunderstandings and should make it clear that:

Vasectomy does not cause impotence. The fluid ejaculated does not contain any sperm, but this goes unnoticed.

Women who have had a tubal ligation continue to menstruate.

Menstrual regulation or early term abortion usually takes 3 to 5 minutes and is safe and effective.

Although there is generally breakthrough bleeding associated with both the oral pill and IUD, it is not considered dangerous to the woman's health. If the problem persists, then the method can be discontinued.

All forms of controlling fertility, including abortion, are safer than allowing pregnancy to go to term.

Couples rarely get an honest explanation of the available methods, their advantages and disadvantages. Women are not informed that 10 to 15 per cent of the IUD acceptors will have a pregnancy and that usually 50 to 70 per cent of the women will discontinue the IUD after four to five years. Out of 100 women accepting the oral pill, about half of them will discontinue within a year and as many as 60 to 80 per cent after two years.

### **Evaluation methodologies**

One of the best techniques to evaluate contraceptive education procedures is to plant women or men in the clinics. They can be specially trained to evaluate the services. If the personnel providing the services know they are being evaluated, but do not know who the evaluators are, then they are likely to provide better education and treatment for the people they see. Every month a woman or man could go to the clinic or doctor's office and collect the following information: (a) the time spent waiting at the clinic for methods; (b) the questions they were asked for clinic's records; (c) the contra-indications that were given; (d) the explanation given about the loop, the pill and other methods, (e) and method which was given most emphasis; (f) the sideeffects that were mentioned; (g) the number of personnel the clinic had and what each staff member did during the visit; (h) if pills were prescribed, the number of cycles of pills that were given at one time; (i) the instructions that were provided on how to take the pills; (j) if an IUD was inserted, whether the doctor explained how to check the

strings; (k) points rating of the clinic in terms of courtesy and the accuracy of information; and (l) how much it costs for pills and for the visit to the clinic.

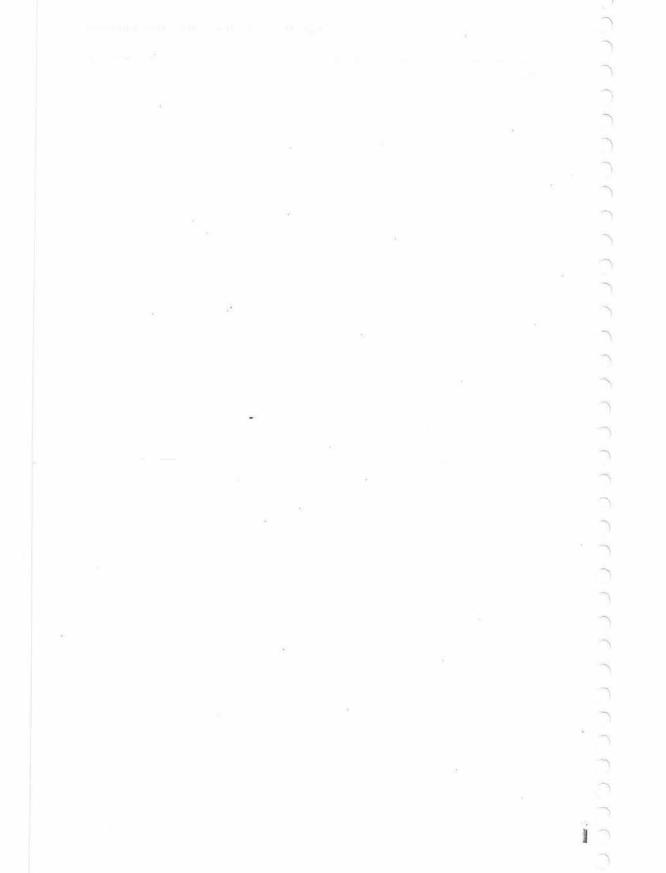

Commendation or criticism could be given by the person planted in the clinic. This technique is also effective in determining whether doctors paid on a fee basis are giving false reports.

The evaluator should determine for each of the clinics, private doctors, depots or health stations, whether or not men and women are choosing a method that helps them avoid unwanted pregnancies. The individual service centre can be evaluated by the proportion of persons accepting, compared with the total proportion of the eligible population in the area, the type of methods they choose, and the number of return visits each month.

Without an identification number for all persons accepting, many men and women are falsely counted as 'new acceptors'. Some national programmes now record more 'new acceptors' than there are women in the reproductive age group. Since new acceptance figures are not an adequate evaluation tool for measuring the success of the programme, except where sterilization is involved, the evaluation staff should look at the total number of persons issued with supplies each month, and then study the use-effectiveness of these methods. To measure the true effectiveness of the programme, the evaluation staff should develop definitions of a 'new acceptor' that prevent the same person from being counted two or three times.

The staff providing clinic education can also help with the pretesting of messages and materials, and with gauging the effectiveness of the field-worker's education techniques. There are a large number of man-hours that health and family-planning clinic personnel could be using for evaluation purposes, such as conducting surveys and tabulating responses. Clinics usually keep a record of answers to questions about source of information. Priority should be given to the analysis of these answers.

## Developing a communications evaluation plan of action

After a fact-finding survey to understand the communication infrastructure and process in your province or country, all the administrative, communication, training and evaluation staff should spend at least five days drawing up an annual plan of action. The agenda for the first day of the meeting should cover the priority needs, determination of communication evaluation objectives, review of the section of defining job descriptions and priority communication needs. The second day should be devoted to reviewing the problems in achieving the objectives and assessing the staff, budget and time requirements to achieve the objectives. The actual plan of action should describe the communication and geographical setting, the major problems in the programme, the criteria used for assessing priorities, the objectives and strategy, the organization and administration, the specific job descriptions of all staff involved in the plan, the target groups and possible messages, the budget breakdown and the principal activities by month. Once the plan is approved, then every month the director of the communication programme should circulate the specific objectives for each month and the tasks to be performed by each staff member during the month. A deadline should be set for the accomplishment of each task.

Many plans of action have not been implemented because they were too ambitious. It is better to have a simple plan that can be carried out than a complex plan that cannot. Because government policy, the status of family-planning programmes, communication infrastructure, staff competence and energy, budget and time requirements vary from area to area, there is no way to give detailed guidelines for a communication strategy.

One possible sequence of events might be as follows:

To conduct fact-finding-two months.

To measure the effectiveness of field-workers, assign targets and improve the feedback of information from the field as well as the individual effectiveness of the workers-two to three months. To construct a list of elite groups and start a mailing system-one month.

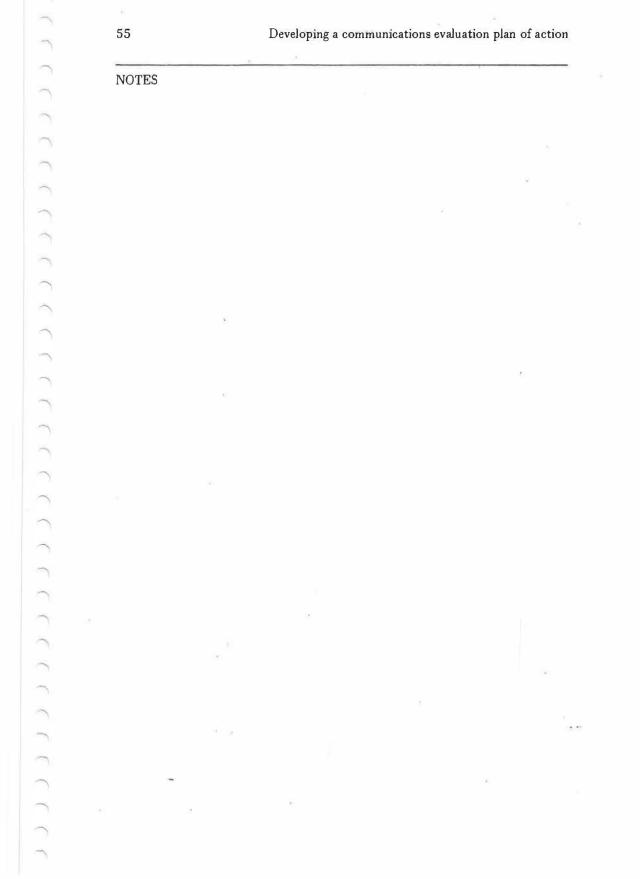

- To conduct baseline family-planning and media exposure surveys, to organize a media campaign and to achieve a visualization of the symbols and knowledge of the slogans-two to three months.
- To measure the communication effectiveness of clinic staff and promote the methods best suited to the needs of women and to study the quality of services by planting women in the clinicsone month.
- To integrate family planning systematically into community education activities such as adult education, into folk media, literacy classes, the factories, agricultural co-operatives and groups formed by the field-workers, such as mothers' clubs.

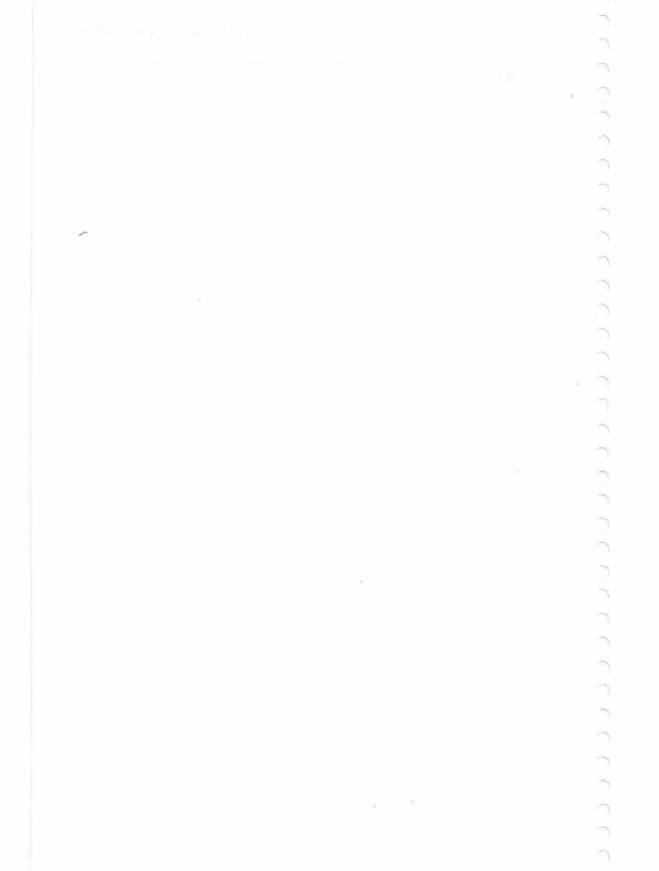

Even if there is little communication or evaluation activity during the next year, the following goals in developing a plan of action should be achieved:

The media messages should be honest.

- The field-workers and clinic staff should stress the methods suited to the needs of the couples.
- There should be one symbol and slogan used in the communications effort.
- The elite should be informed that the population in their province or country will double no matter how intensive the family-planning activities and as many as 25 to 40 per cent of all women are having pregnancies they do not want.

The communication and evaluation staff should consider two important objectives when developing a plan of action. First, the communication strategy should help couples discriminate between family sizes, so that each couple has a pregnancy spacing concept and a size of family goal. Second, couples should know how to use the appropriate familyplanning methods.

## Appendices

•

.

.

## Fact-finding questionnaire and check-list

Before developing a plan of action for the communication programme, there should be an understanding of the population policy; the administrative obstacles to communicating messages; the private and public efforts to communicate to various target groups; and the ongoing evaluation techniques used to gauge results. Not all the questions raised will be answerable but most of the fact-finding questions are relevant to developing a strategy.

### I. Population and family-planning policy

1

A major problem in communicating family-planning messages has been the policy of legal restrictions. Within family planning there are problems in administratively structuring the programme high enough to utilize public communication infrastructure and flexible enough to use the private advertising or marketing systems.

There are usually restrictions on utilizing the available medical and paramedical manpower by prohibiting fees for services or preventing the development of a broadbase distribution system by not allowing depot or commercial distribution of condoms and oral pills. Another problem is prohibiting abortion and/or sterilization.

In going beyond family planning, there are the issues of child allowances, compulsory education, the legal rights of women, the involvement of women in the labour force, government development priorities, the problems of the environment, the health status of women and children, the legal age for marriage, energy and food shortages, income disparities, and a host of other relevant issues that should be considered in the fact-finding process.

### A. Policy within family planning

- Can the family-planning communication staff work directly with the Ministry of Information and Broadcasting to develop a plan for using the radio, television and other public-sector media?
- Can contracts be signed with private radio stations, advertising agencies or marketing firms to develop campaigns?
- Can commercial channels or depots for distribution of condoms and oral pill supplies be developed?
- 4. Can public and private doctors and paramedical personnel be given a set fee for each IUD insertion, sterilization or prescription of pills?
- 5. Are medically safe abortions offered to women who fail using the contraceptives given them?
- 6. Are there restrictions in offering vasectomy and tubal ligation?
- Are there restrictions on the prescription of oral pills or having paramedical personnel insert the IUD?

- 8. Are there excessive duties on the import of contraceptives?
- 9. Can contraceptives be advertised in the newspapers or on the radio?
- 10. Are there restrictions against paying persons who recruit new acceptors?

### B. Policy beyond family planning

- 1. How can the family-planning message be integrated into the total development communication process?
- 2. What are the problems associated with providing women equal rights and opportunities?
- 3. What are the local issues associated with environmental problems?
- What policies affecting development, and subsequently fertility, mortality and migration, are relevant to the following issues:

   (a) development allocations by sector;
   (b) income disparities;
   (c) health insurance and social-security programmes;
   (d) labour versus capital intensive programmes;
   (e) agricultural co-operatives and land reform;
   (f) public participa
- tion in the programmes, and (g) graduated income tax.
- 5. What are policies pertaining to birth spacing or stopping rewards and constraints?
- C. Communication activities aimed at changing a policy
- Are there plans to conduct a survey of the elite population and family-planning attitudes? (see Appendix 9).
- 2 Has the Head of State signed a statement supporting family planning?
- 3. What statements have been issued by the various ministries, the heads of planning organizations, and other leaders?
- 4. Have leading economists and sociologists written articles and papers on population and family planning for national publication?
- 5. Have there been or are there plans for seminars on population for newspaper editors, broadcasters and others working in the communication effort?
- 6. Is there a newsletter on population and family planning sent to national as well as provincial leaders and professionals?
- 7. Are there organized 'speakers' bureaux?
- What findings from knowledge, attitudes and practice (KAP) surveys have been publicized, such as problems of unwanted children and public support for family planning? (see Appendix 6).
- 9. Is there a systematic attempt to send news releases on population to newspapers, radio stations and magazines?
- 10. Are there plans for national or regional workshops or seminars on family planning?

### II. Development support communication

- 1. What are the communication support activities for agricultural, educational and industrial development efforts?
- What health campaigns are planned and how can population and family planning be related to the total health-education efforts?
- 3. What studies of parents' aspirations have been conducted by university or government agencies and what is the relevance to family-planning motives?
- 4. How are the mass media used to support development programmes, what tie-ins can there be with family planning and population related content?
- 5. What development support campaigns have been most successful and how can familyplanning staff learn from the results of these campaigns?
- 6. What have been the pre-testing and evaluation techniques used, and what have been the results of the studies?
- 7. What family-planning messages can be tied in with the development communications support activities?
- 8. What audio-visual materials are going to be used for the development communication activities and can they have some family message content?
- 9. Will government ministers or departmental heads issue directives or supporting statements on population and family planning?
- 10. Can family planning be added to the training programmes for schoolteachers, agricultural extension agents and other functionaries?
- 11. Can the functionaries be given leaflets on the contraceptives or coupons?

- 61
- 12. Will ministries allow payments for IUD and sterilization referrals as well as having the functionaries act as depots for condoms and oral pills?
- 13. Can the functionary supervisors help monitor the family-planning communication activities?
- 14. What feedback can the functionaries provide on the effectiveness of the familyplanning communications programme?
- 15. Would functionaries be willing to evaluate the communication activities or the field-workers or clinic staff, to pre-test messages or conduct baseline surveys?

III. Contraceptive services

- 1. How many doctors are there in your country?
- 2. How many of these doctors are providing contraceptives to their patients?
- 3. How many paramedical personnel have been trained to insert the IUD or distribute oral contraceptives?
- 4. About how many condom distribution places are there?
- 5. Approximately what percentage of babies are born at hospitals, health stations, under the care of trained and certified midwives, untrained midwives, or others?
- 6. If all those who deliver babies are not now trained to provide contraceptives, are there any plans to train them during the next year?
- 7. Which methods of contraception (if any) are now being offered by government services and voluntary agencies?

Methods	Government services	Voluntary agencies
IUD		
Pills		
Sterilization		
Condoms		
Other		

8. How much does the patient pay?

	IUD	One pill cycle	Dozen . condoms	Vasec- tomy	Tubec- tomy	Other (specify)
Government sponsored services						
Family-planning association services						1.0
Private services		12000				
Other						

9. Can a patient (man/woman) obtain sterilization upon request from government health services? From a private physician?

10. If a woman becomes pregnant while using a contraceptive, can she obtain an abortion? If yes, how much must she pay?

11. Could government family-planning centres handle additional acceptors of family planning? If yes, what percentage of increase might be absorbed by established centres?

12. What percentage of the rural population will be provided with contraceptive services during the next year?

### IV. Targets

1. Acceptances last year and targets during the next year:

	, A	cceptances		Targets during the next yea		
Contraceptive method	Government programmes	Family Planning Association programmes	Other (specify: private MDs, chemists)	Government programmes	Family Planning Association programmes	Other (specify)
IUD						
Oral contraceptives	а.				1	P 10 101
Vasectomy						
Tubal ligation						
Condom	-					
Foam						
Diaphragm						*
Other (specify)			1. C			

### V. Radio

1. Give the number of government and privately owned radio transmitters.

2. How many receivers are there?

3. Approximate percentage of people owning radios in urban areas; in rural areas?

4. Will the government give free radio time for family planning?

5. Will the private stations give free radio time for family planning?

6. How much time will government stations allow:

a. How many 60-second spot announcements for family planning might be available each month?

b. How many 5-minute announcements each month?

7. Can the script-writers at the radio stations be commissioned to bring family planning into the content of their programmes?

8. Would the radio stations broadcast news items on family planning and population?

9. What are the clearance procedures to obtain free time on the radio?

10. Does the government radio station take any commercial spots? If so, what is the cost per 30-second spot during prime time? Other hours?

<sup>11.</sup> Which private stations would take 30-second announcements on family planning and what would be the cost?

Station	Would take	Cost of 30-	second spot
			Other hours
1			
2			
3		1	
4			
5		-	

12. Would private station managers be willing to allow free time?

- 63
- 13. Have any surveys been conducted to indicate when people listen to the radio most often?
  - a. When do women listen to the radio most often?
  - b. What percentage of all married women listen to the radio at least once a day?

### VI. Newspapers

1. How many newspapers are there in your country?

2. What is the estimated total circulation?

3. What type of family planning related copy would the paper use?

Paper No. (Name)	1 Paper No. 2 (Name)	Paper No. 3 (Name)
Feature stories		
Letters to the editor		
Cartoons		
Comic strips		
Other (specify)		

4. For the three largest newspapers, could you obtain the following information from the publisher or managing editor?

	Names of three leading newspapers			
	No. 1	No. 2	No. 3	
What is the circulation?				
Average number of pages?				
Daily or weekly?				
Does the editor believe contraception should be provided to women?				
What types of news releases would be published?	-			
<ul> <li>a. Items on effect of population on development plan</li> </ul>				
<ul> <li>b. Items on when population will double</li> </ul>				
c. Items on effect of population on education			- 10 - 10 - 10 - 10 - 10 - 10 - 10 - 10	
<ol> <li>Items on status of the family- planning programme</li> </ol>		(4)		
e. Information on contraceptives			The state	
f. Location of family-planning clinics			2)#7) *	
g. Other (specify)				
Bow much would it cost per week for six column-inches of space?				
Would the publisher donate the above six column-inches a week for an advertisement?				

### VII. Magazines

1. How many magazines are there in your country?

2. What is their estimated total circulation?

3. Which magazines are most read by national leaders and/or policy-makers?

Names of magazines

<u>Circulation</u>	No.1	No.2	No.3	No.4	No.5	No.6
Would editor be interested in having articles on population?			÷			** §
Would magazine publish an article on the family-plannin programme or contraceptives?	g		1			
How much is advertising space for & page?						8
b page?	1					
Full page?						

4. What are the three magazines most read by women in the child-bearing years?

Names of magazines	
No.2	No.3
e.	

### VIII. Mailings

- 1. How many post offices are there in your country?
- 2. Are postal services available throughout rural areas?
- How many days does it normally take for a letter from the capital city to reach an individual in a remote village?
- 4. Who is responsible for delivering letters in rural villages?
- 5. What is the lowest cost of sending letters at a bulk rate?
- 6. Would the government allow letters on family planning to be sent free?
- 7. Are vital data, such as births, deaths, marriages, recorded in urban areas?
- 8. Would the birth registrar allow a clerk in his office to send out letters?
- 9. Would the birth registrar allow a clerk in his office to copy names and addresses from his records to be used for mailings?
- 10. When an illiterate woman in a rural area receives a letter, who will usually read it to her?

#### IX. Films

- 1. How many cinemas are there in your country?
- 2. What is their estimated total seating capacity?
- 3. Are slides or film clips shown before or after a programme?
- 4. Would the cinemas show films or slides on family planning before or after the programme?
- 5. What would be the cost for showing slides three times daily for one month in a medium-size theatre?
- 6. How many projectors are available to show family-planning films?
- 7. Are the above projectors now being used to show family-planning films?

X. Indigenous entertainers

- 1. What are some types of indigenous entertainers that could be used to promote family planning?
- Are there puppet shows, play groups, musicians and theatre groups that could integrate family-planning content into their entertainment?
- 3. Would they be willing to bring in family planning as a part of their entertainment?
- 4. If so, what would it cost?

## Pre-test baseline questionnaire

2

The pre-test setting at the Health Department or wherever the interview is taking place should be quiet and undisturbed. Do not use the same subjects for different types of pre-test studies. To test interview bias, simply colour code the responses on tabulation sheets so that each colour represents a specific interviewer. You can see immediately by the colour patterns if there is an interviewer bias. You can also give the pre-test to the interviewer before he or she starts the pre-test. Bias is diagnosed by the similar responses of the interviewer and interviewees.

Make sure that all the baseline questions are completed for each test subject. The baseline questions take only ten minutes to complete. By analysing the types of response by characteristics of the subject, you can gauge better how to gear the messages to specific target audiences.

All the data for each pre-test can go on one card directly from the questionnaire. The key-puncher can place the codes on a card directly from the questionnaire. To place all the data on cards for all the pre-tests takes a key-puncher about two hours. To run off all marginal tabulations and relevant cross tabulations on a counter and sorter would take about eight hours. In order to get distributions by groups of messages on a counter and sorter, you must first isolate the groups and then get the message distribution.

### Pre-test form for messages

3

A counter and sorter can be used for all cross and marginal tabulations. The baseline data should be put on each pre-test card. For this reason, the column starts with '27'. Most standard cards have eighty columns.

Although communication programmes can have several messages reinforcing a central theme, there should be only one slogan. The slogan can evolve from testing various messages. Place all the slogans or messages on 4-inch by 12-inch cards in bold type. You will have to read the messages to illiterates. Read four messages at a time and then note the preferred message. Messages used here are for illustration purposes only. After you have selected out of each of the four groups the messages liked least' or 'most', you can then have the messages ranked by various criteria. To avoid bias in message order presentation, change the order of showing the slogan with each subject.

For questions 10 to 15 you will need to get the frequency of responses and assign codes to them. Once you have the coding instructions, you can then provide the proper codes. Remember that all columns should have one code, not more than one.

28

30

29

31

 I am going to read to you a series of statements. I would like to know which of the statements you like most and which you like least.

LEAST	GROUP 1 MOST	
	1-1 For safe, reliable, inexpensive methods to stop child birth, use the loop or pills.	Least
29	1-2 To avoid another pregnancy, take a pill a day. 31	
	1-3 The loop and pills are safe.	Most
	1-4 For protection against pregnancy continue using the pills.	
	1-5 Your friends and neighbours are using the loop and pills; why don't you?	
LEAST	GROUP 2 MOST	
	2-1 To have children only when wanted, visit the nearest health station.	

LEAST GROUP 2 (cont.) MOST 2-2 Do you want to be pregnant now? Least 2 33 2-3 The more mouths to feed from your wages, 35 32 the less schooling for each. The more children in the home, the less space for Most 2 34 each. 2-4 Children that are planned have better health, social status, more security, more food, better schooling and jobs. 2-5 You can have children when wanted. LEAST GROUP 3 MOST 3-1 Men, inform your wives of family planning. 3-2 A planned family is a happy family. Least 3-3 For more food, better housing and 36 37 39 education of your children, practice Most 3 family planning. 38 3-4 Family planning is safe and harmless. 3-5 Family planning is for parents who want children later. LEAST GROUP 4 MOST 4-1 Today you do not need to have 5 or 6 children because you think that 3 or 4 Least may not survive. 40 4-2 Two or three children can provide better support in your old age than five 41 43 or six. 4-3 Two children is better. 4-4 For the prosperity of ...... /name of country/ have only two or three children. 4-5 Two or three children is best. 2. Now, of the four you like most, which do you think is the best? 44 Group 1 2 3 4 Message 1 2 3 4 5 3. Of the four you like the least, which is the worst? 46 Group 1 2 3 4 Message 1 2 3 4 5 4. Now I am going to put all the messages in front of you (or, will read all the messages again). What one message explains most what a person like yourself would most want to know before accepting a method of family planning? 48 Group 1 2 3 4 Message 1 2 3 4 5

## Pre-testing posters

4

2

1

Eir

~

Punch all the baseline data on the poster pre-test card. Divide the posters into groups of four or five. Make sure that the subject sees the poster for only four seconds. After showing a series of posters, determine which poster was liked most and which least. The posters described are for illustration purposes only. For questions 16 to 21 you will have to develop your own codes based on frequency of response.

Pre-test radio spots

5

For ease of tabulation we suggest that nine radio spots of thirty-second duration be pre-tested. The radio spots are usually competing with the sounds of children and household noises. Although the setting at a health station is somewhat artificial, the spots could be pre-tested using a tape recording of the spots, mixed with news, music or even static. Under such circumstances it is difficult to develop rank order comparisons. We therefore recommend that the spots be placed in varying order on a tape recorder with only a sound symbol separating the spots. If you do separate the order of presentation of the spots to avoid bias, make sure you keep track of the number of individual spots. You should play three spots at a time and then get preference.

The rank order test can be done by giving a woman a sheet of paper designating 'very good', 'good', 'poor' and 'bad', and 'very truthful', 'truthful', 'partially truthful' and 'not truthful' for each spot or you can simply ask the woman while playing each spot how she rates the spot by these criteria.

For illustrative purposes we will describe the spots in the following manner: (a) announcement on the pill; (b) announcement on the IUD; (c) announcement on sterilization; (d) announcement on the condom; (e) a spot describing all methods; (f) a spot on the two or three-child family; (g) a spot on the national or provincial population problem; (h) a spot aimed at elite groups; (i) a spot aimed at husbands.

If a sound symbol does not separate the spots, then a slogan should. We suggest the spot be played in groups of three to get a preference and the individual to rank the spots by truthfulness and 'good' or 'bad'.

Col.

28

I'm going to play some announcements on the tape recorder.
 I would like to know which ones you like the least and most.

Liked least Liked most

The 167 questions on the pre-survey take about twenty-six minutes to ask and obtain the responses. The findings from the survey will provide a baseline on population and family-planning knowledge, attitudes and practice. The answers to the questions relating to population growth, desired last pregnancy and support for family planning can be used in the elite questionnaires and as a basis for formulating messages to the elite. The media exposure questions will help with the masscommunication strategy. There are questions aimed at optimizing the efficiency of contraceptive services and selecting the best type of fieldworkers. Facility access and utilization questions will be useful in community education and contraceptive delivery systems.

Once all the questions have been completed, an identification number should be placed on the questionnaire. Take the questionnaires at random and start with '0001', '0002', and continue until all questionnaires have a number. Place the number on all cards along with a survey and identification code. There are a few open-ended questions. To develop the codes, list all the responses on 100 questionnaires in eight major response categories. Give the most frequent responses codes 1 through 8 and use the same codes for all the questionnaires. Code 9 would be 'no answer'.

It takes about five interviewers two months to complete 500 questionnaires.

Most countries have some communication activities. You may want to add some of the thirty-eight questions listed on the Post-Evaluation Survey (Appendix 7).

### The elite questionnaire

8

By asking the elite a series of questions, the communications staff can gain an awareness of their knowledge of the population problems and the family-planning programme, as well as determine their potential participation in assisting with the communication programme. Before the questionnaire is used, it is important to provide some information to the elite on population and family planning. This can be done by sending them several small leaflets describing the population problem and findings from the KAP surveys. An outline for the leaflets could be summarized as follows:

- The population problem: (a) the current birth rate, death rate and growth rate; (b) number of years for population to double; (c) with birth rate reduction of one half in ten years, when the population will double; (d) an intensive family-planning programme will not prevent the population from doubling; (e) when the population will double; even with replacement size families in ten years.
- Family planning: (a) the proportion of women stating they did not want their last pregnancy; (b) the current state ideal family size;
  (c) women coming to the clinics generally do not want any more children-describe their age and number of living children; (d) the drop-out rates for oral pills, condoms and withdrawal; (e) the principal misconceptions about vasectomy-loses sex drive, becomes fat, fluids during the sex act are no longer emitted and voice becomes higher.
- Legal restrictions: (a) advertising contraceptives; (b) using paramedical personnel; (c) abortion restrictions; (d) restrictions on vasectomy and tubal ligation; (e) minimum age for marriage; (f) women's rights; (g) child labour; (h) registration of births and deaths; (i) compulsory education.
- Policy: (a) birth, death and immigration targets or policies; (b) using incentives and disincentives; (c) priority of family planning in development programme; (d) statement by Head of State and government ministers.

Each of these sections could be sent as separate leaflets or materials to the elite groups or as one pamphlet. It is important that before utilizing the questionnaire, the elite groups have some information on the population problem, the family-planning programme, the legal issues in developing the programme, as well as the current national policies on population and family planning.

There are several ways of getting the questions asked. The questionnaire can be sent in the mail; the communications or evaluation staff can ask the questions; the heads of various government ministries or departments could send out the questionnaire to under-secretaries or provincial administrators; or newspaper reporters could ask the questions during an interview.

The findings from the questionnaire should help evaluate the elite groups' awareness of the population problems and provide guidelines for a communications strategy.

The questions you will now be asked are in two parts. The first part will be to understand your knowledge and attitudes about population and family-planning matters. This information will be kept confidential. The second part will be used to gauge your potential co-operation in the family-planning programme. It is assumed that you have read the leaflets which were sent to you.

- Do you approve or disapprove of a programme to provide parents with the opportunity of having children when they want them?
  - (1) Approve(3) No answer(2) Disapprove(4) Don't know
- Do you believe the population in .....is growing too fast, too slow or just about at the right rate at this time?
  - (1) Too fast(4) No answer(2) Too slow(5) Don't know(3) Just about right
- 3. The population in ..... will double even with a successful family-planning programme. Do you think this is good or bad for .....?
  - (1) Good (3) No answer (2) Bad (4) Don't know
- 4. Do you believe the government should establish a policy whereby couples would want and have only two or three children?
  - (1) Yes
     (3) No answer

     (2) No
     (4) Don't know

# The field-worker daily record form

The daily home visit record form should accomplish the following objectives: (a) monitor births and child deaths; (b) gauge pregnancy prevalence and pregnancy outcome; (c) determine current contraceptive use and intent to use; (d) record a family plan specifying how many children are wanted and when.

If a field-worker has 20,000 population in her area, she will have about 5,000 households with 3,600 women in the age group 15 to 45. By conducting ten home visits a day for 300 days, she can see most of the women in the first year. The analysis of the home visit form is only useful if each individual family is identified and the changes by family analysed. There should be a yearly analysis of age and parity of the women and men contacted, the pregnancy status, the current contraceptive use by method, and the expressed ideal family size.

The field-worker should be given twelve loose-leaf binders, one binder for each month of the year. In each binder should be sixty home-visit record forms. On each form is room to record data for five families visited five times. If a family moved out of the area or another family moves into it, a home-visit record form should be placed in the binder to record the relevant events for the new family. With sixty forms, information can be obtained for a total of 300 families each month, though this is highly unlikely.

At the end of the month, the data collected is given to the evaluation unit. The data is punched on cards for each family. Tabulations for the families could monitor changes in contraceptive practice, pregnancy status and fertility. The binder is returned to the field-worker at the end of the next month, when the next binder is collected from her. This exchange could occur on pay-day or at monthly meetings with the supervisor.

For each family in a household, the field-worker should record the name of the head of the family, name of spouse and the complete address. At the top of the form, the field-worker records her identi-

-

fication number and the identification number assigned to the city or town where she works.

Each family is given an identification number starting with '0001', '0002', etc. The field-worker places the appropriate codes for each visit. The coding instructions should be printed and placed in each binder.

Purpose of visit	Column 12

A manual on evaluation of population communication programmes

Slogan '

IUD (leaflet and coupon, print 200,000 in booklets of 50)

- 1. Everyone is now talking about the IUD. It is a contraceptive that has been tested and proved very effective.
- 2. There are only one or two pregnancies per 100 women using the IUD.
- 3. The TUD is made of a soft, flexible plastic.
- 4. It is free at all clinics listed on this coupon.
- A skilled doctor can insert the IUD in a few seconds. Because there is no pain, the woman is not put to sleep or given a shot.
- When the woman wants a baby, the doctor simply pulls the IUD out without pain in a few seconds.
- 7. The best time for inserting the IUD is two days after the menses. However, the IUD can be inserted at any time.
- 8. Some women will have some bleeding for a short time but this will certainly not harm their health. In a few cases a woman will bleed for more than two weeks. If this is so, she should return to her doctor. If there are any cramps, they will usually go away. The woman's body has to get used to the new device. The IUD has two small strings which can be felt by the tip of the finger. The woman must make sure the IUD is in place by feeling the strings in the birth passage at least once a week.
- 9. With very few women, the IUD may be lost during the first or second period after insertion. This of course would mean the protection is lost. They should return to the doctor to have the IUD put in again as soon as possible.
- Why not show this coupon to a friend, neighbour or relative? They might be very thankful.
- 11. When can I go to a female doctor for an IUD? You should see the doctor on \_\_\_\_\_\_\_\_\_/date/ at \_\_\_\_\_\_/time/.
- 12. The clinics are located at:

#### What you should know about sterilization

Female sterilization is a permanent operation which prevents the ovum of the female from reaching the sperm of the male because the tubes where a baby is first started are cut and tied. Male sterilization is a permanent operation which prevents the sperm from joining the fluids emitted during the sex act.

Most couples who practise family planning want to stop childbirth, not space their children. Thousands of males and females have had a sterilization operation. Sterilization is the only 100 per cent effective contraceptive besides the oral pills. But with oral pills there is a 70 per cent drop-out after one year and with the IUD a 50 per cent drop-out after two years. The operation is free. Once the operation has been performed, there is nothing more the couple has to do. Nothing to pay for or use continuously. The operation is safe, simple and reliable. In order to qualify for sterilization you must be over 30. The wife must be under 45, have two children and definitely not want any more.

Female sterilization is an operation which takes about 30 minutes in hospital. The woman should rest in the hospital from 2 to 3 days. The operation is frequently performed four days after birth.

The male operation does <u>not</u> cause impotence. The fluids are still emitted but they do not contain the sperm which usually comprises less than one-tenth of the emission. Male sterilization is <u>not</u> castration. Nothing is removed. There is no change in voice, weight or appetite. The only change is that the father has no longer to fear unwanted pregnancies. The operation can be done in 15 minutes in a doctor's office. The male can go home the same day; after two days he returns to the doctor to have the stitches taken out. After giving a local anaesthetic, the doctor makes a cut about the size of a thumb nail in the back of the scrotum. He then ties the tubes which carry the sperm. There is almost no pain. The man should use condoms for the first 15 sex acts after the operation as the sperm may still be in the passages. Male sterilization is easier, takes a shorter time, costs less, and is quicker than the female sterilization. Female sterilization is a more frequent operation because it is performed after childbirth.
