USING EQUATIONS TO SOLVE WORD PROBLEMS

(Using Two Let Statements)

1

DEFINE A VARIABLE

Use "let statements" to define what you are finding with just ONE variable.

2

SET UP EQUATION & SOLVE

Use keywords to set up an equation. Then solve!

3

ANSWER IT!

Give exactly what the problem is asking for.

Directions: Define a variable using let statements, set up an equation, then solve.

BONUS: Solve the equation for x : $\frac{3}{2}\left(\frac{1}{2}x - \frac{10}{3}\right) = \frac{1}{6}(7x + 10)$

$$\begin{aligned} \frac{3}{4}x - 5 &= \frac{7}{6}x + \frac{5}{3} \\ -\frac{3}{4}x &\quad -\frac{3}{4}x \\ \hline -5 &= \frac{5}{12}x + \frac{5}{3} \\ -\frac{5}{3} &\quad -\frac{5}{3} \\ \hline \frac{12}{5} \cdot -\frac{20}{3} &= \frac{5}{12}x \cdot \frac{12}{5} \\ -16 &= x \end{aligned}$$

$$\begin{aligned} \frac{7}{6} - \frac{3}{4} &\quad -\frac{5}{1} - \frac{5}{3} \\ \frac{14}{12} - \frac{9}{12} &\quad -\frac{15}{3} - \frac{5}{3} \\ \frac{5}{12} &\quad -\frac{20}{3} \end{aligned}$$

$x = -16$
