

TERACURE™

NEMATICIDE

ALL NATURAL ORGANIC NEMATODE CONTROL

TERACURE contains DRAGONFIRE CPP oil derived from specific engineered cultivars of wild plant seeds. The oil is extracted from the round CPP seed by cold pressing, which produces food grade oils.

CPP seed oil is considered a sesame family product. However, this round genotype seed, unlike common sesame seed, produces high concentrations of linolenic, lioleic, palmitic, and oleic acids. Linolenic acid content exceeds 60%.

Programmed applications will reduce adult nematode populations; deter feeding on the plant roots, and interrupt reproduction cycles. Long-term effects are a reduction of population and an opportunity for plant recovery and root growth.

TERACURE also stimulates microbial soil activity. Providing organic materials and nutrients in balanced ratios that make it possible for indigenous soil microorganisms to thrive and proliferate. And TERACURE increases the cation exchange capability; know as “CEC”, which improves the plants ability to uptake nutrients.

Programmed applications will not only control nematode infestations but will also improve the soil environment,

TERACURE is safe for applicators, pets, and children. There is no noxious odor and is safe to use by waterways.

TERACURE presents no environmental problems and may be applied to all food and non food agricultural crops, nursery stock, and turf including golf courses, sports fields, playgrounds, schoolyards, lawns, and sod farms. See label for applications rates.
