CSLAP 2012 Lake Water Quality Summary: Silver Lake

General Lake Information

LocationTown of PerryCountyWyomingBasinGenesee River

Size 328.9 hectares (812.4 acres)

Lake Origins Natural

Watershed Area 5,230 hectares (12,918 acres)

Retention Time1.2 yearsMean Depth7.2 metersSounding Depth11.6 metersPublic Access?cartop launch

Major Tributaries Silver Lake Inlet

Lake Tributary To... Silver Lake outlet to Genesee River to Lake Ontario

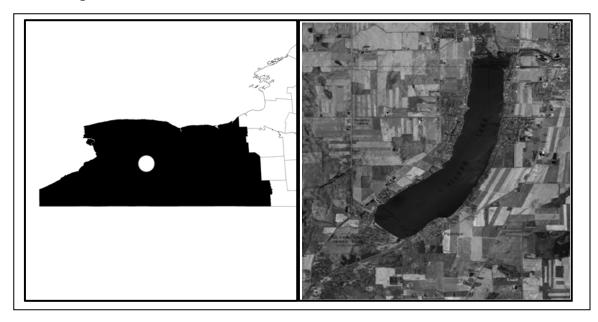

WQ Classification A (potable water)

Lake Outlet Latitude 42.716 Lake Outlet Longitude -78.020

Sampling Years 1986-1991, 1995-1997, 2006-2012

2012 Samplers William Soules William Soules

Lake Map

Background

Silver Lake is an 810 acre, class A lake found in the Town of Castile in Wyoming County, just west of the Finger Lakes Region of New York State. It has been sampled as part of CSLAP periodically since 1986.

It is one of two CSLAP lakes among the more than 15 lakes found in Wyoming County, and one of three CSLAP lakes among the more than 35 lakes and ponds in the Genesee River drainage basin.

Lake Uses

Silver Lake is a Class A lake; this means that the best intended use for the lake is for potable water intake—drinking—as well as contact recreation—swimming and bathing, non-contact recreation—boating and fishing, aquatic life, and aesthetics. The lake is used by lake residents and visitors for power boating and swimming, through residential shoreline access to the lake and a state launch on the east side of the lake.

Silver Lake has been regularly stocked by New York state. About 4.2 million ½ inch walleye are stocked annually. Fish species found in the lake include black crappie, bluegill, brown bullhead, largemouth bass, northern pike, pumpkinseed sunfish, rock bass, walleye and yellow perch.

General statewide fishing regulations are applicable in Silver Lake. In addition, the open season for trout is April 1st to October 15th, with no minimum size of 12 inches, and a daily take limit of five, with no more than two trout to be greater than 12 inches.

There are no lake-specific fish consumption advisories on Silver Lake.

Historical Water Quality Data

CSLAP sampling was conducted on Silver Lake from 1986 to 1991, 1995 to 1997, and 2006 to 2012. The CSLAP reports for each of the past several years can be found on the NYSFOLA website at http://nysfola.mylaketown.com. The 2011 CSLAP report and scorecard for Silver Lake can also be found on the NYSDEC web page at http://www.dec.ny.gov/lands/77828.html.

The lake was sampled as part of the state Lake Biomonitoring pilot project (as part of the state Lake Classification and Inventory study, or LCI) conducted by the NYSDEC in 2008. Most of these readings are comparable between the programs—conductivity readings were much higher in the LCI (but similar to those at other times of the year). The depth profiles show oxygen depletion below 7-8 meters, as expected given the highly elevated deepwater phosphorus readings. Chloride readings are high enough to indicate some runoff from road salting operations, but are well below the state water quality standards. The biological samples collected as part of this program have not yet been analyzed, and these results will be summarized in a separate report.

Silver Lake was sampled by New York State as part of the Biological Survey of the Genesee River basin conducted by the Conservation Department (the predecessor to the NYSDEC) on August 26, 1926. The majority of the water quality indicators evaluated as part of CSLAP were not included in this survey. pH readings in 1926 were slightly higher than the typical Silver Lake readings, but were within the range measured through CSLAP. Water clarity readings in 1926 were about 4.9 meters, higher than in all but a single CSLAP sampling session in 1989 (and

much higher than in recent years in late summer). The lake was thermally stratified, with the transition from warm water to cold water occurring at a depth of about 20-25 feet. Deepwater oxygen levels were depressed near the lake bottom (readings about 1.7 ppm, versus about 8.4 ppm at the lake surface). The field notes from this survey indicated the following:

"Silver Lake is a typical, shallow, brown water lake characterized by a fair amount of muddy shoreline, an abundance of vegetation and a rich bottom of mud.... The lake apparently falls in the class of typical, brown water, non-bass (small mouthed) lakes."

"Silver Lake, in Wyoming County, lies in a shallow valley with very gradual slopes. The surrounding hills rise only a few hundred feet above the lake, which is 1,356 feet above sea level. The lake is about three miles long and about three-quarters of a mile wide in its widest place. Its shores are mostly stony or gravelly, except that at the north and south ends, where swamps occur, the shore and bottom are muddy. The lake is fed by springs. A small inlet and the outlet of Silver Lake both occur at the north end.

The lake is shallow and the flat bottom is mostly about 25-35 feet deep. The deepest bottom found in the lake was 37 feet. The transparency of the water in Silver Lake is low as compared to Conesus Lake and may be termed "brown water". A white disc 10cm. in diameter lowered into the water at noon, August 26, 1926, disappeared from view 16 feet from the surface. On account of its shallowness and the low transparency of the water, Silver Lake shows no stratification in its plankton life. Rooted plants occur only in the shallow water near the shore and at the ends of the lake; none were observed below the 15-foot depth".

The lake was surveyed in 1976 and 1979 as part of a DEC statewide water quality study. These data indicate conditions similar to those measured in the mid-1980s through CSLAP. Water quality monitoring has been conducted as part of state fisheries stocking activities; the results indicate slightly higher water clarity in the fisheries dataset, but the other data appeared to be comparable.

The lake has also been studied in the past by the Community College of the Finger Lakes (Dr. Bruce Gilman), SUNY Geneseo (Dr. Herman Forest) and others.

Neither the Silver Lake inlet nor outlet has been monitored through the NYSDEC Rotating Intensive Basins (RIBS) program. The outlet was sampled downstream of Perry (about 6 km downstream from the lake) through the state stream macroinvertebrate monitoring program in 1995 and 1999. The summary of this sampling was as follows:

"Based on macroinvertebrate sampling downstream of Perry in 1999, water quality was assessed as moderately impacted. The sample was dominated by filtering caddisfly larvae. The impact was likely a combination of impoundment effect and enrichment from the Perry sewage treatment facility. The stream was previously sampled in 1995, and was also determined to be slightly impacted".

Lake Association and Management History

Silver Lake is served by the Silver Lake Association. The lake association is involved in a number of lake improvement and social activities.

The lake association maintains a web site at http://www.silverlakeassociation.org/

Summary of 2012 CSLAP Sampling Results

Evaluation of 2012 Annual and Monthly Results Relative to 2006-2011

The summer (mid-June through mid-September) average readings are compared to historical averages for all CSLAP sampling seasons in the "Lake Condition Summary" table, and are compared to individual historical CSLAP sampling seasons in the "Long Term Data Plots – Silver Lake" section in Appendix D.

Evaluation of Eutrophication Indicators

Water clarity readings were higher than normal in 2011 and 2012; in 2012, this was coincident with much lower than normal phosphorus and chlorophyll *a* readings. Despite these significant changes, lake productivity still increased during the summer—water transparency decreased as nutrient and algae levels increased. None of these indicators has exhibited any clear long-term trends.

The lake can be characterized as *mesoeutrophic*, or moderately to highly productive, based on water clarity (typical of *mesotrophic* lakes), total phosphorus and chlorophyll *a* readings (both typical of *eutrophic* lakes). However, chlorophyll *a* readings in 2012 were more typical of *mesotrophic* lakes. The trophic state indices (TSI) evaluation suggests that water clarity readings are higher than expected given the phosphorus and chlorophyll *a* readings in the lake, although this difference was less apparent than usual in 2012. This discrepancy may be due to zebra mussels. Overall trophic conditions are summarized on the Lake Scorecard and Lake Condition Summary Table.

Evaluation of Potable Water Indicators

Algae levels are frequently high enough to render the lake susceptible to taste and odor compounds or elevated DBP (disinfection by product) compounds that could affect the potability of the water, although it is not known if this results in any actual impacts to drinking water (and this threat was lower in 2012). Deepwater phosphorus, ammonia, iron, manganese, and arsenic readings are higher than those measured at the lake surface, and these manganese levels exceed the state water quality standards, so deepwater intakes may not support potable water use. Potable water conditions, at least as measurable through CSLAP, are summarized in the Lake Scorecard and Lake Condition Summary Table.

Evaluation of Limnological Indicators

Total nitrogen readings were lower than normal in 2012, perhaps due to (or associated with) lower than normal algae levels. Color readings have increased slightly since CSLAP sampling began in 1986. Each of the other limnological indicators was close to normal in 2012, and none of these indicators has exhibited any clear long term trends. Overall limnological conditions are summarized in the Lake Scorecard and Lake Condition Summary Table.

Evaluation of Biological Condition

Limited macrophyte surveys have been conducted through CSLAP at Silver Lake. At least 5 aquatic plant species have been found, including at least one exotic plant species (*Myriophyllum spicatum*, Eurasian watermilfoil). The biological survey of the lake conducted by the Conservation Department in 1926 found at least 27 aquatic plant species, including at least one

other exotic plant species (*Potamogeton crispus*, curly-leafed pondweed) and at least one protected plant species (*Megalodonta beckii*, water marigold). The modified floristic quality index (FQI) for the lake based on CSLAP data indicates that the quality of the aquatic plant community is "poor," while the FQI based on the 1926 data indicates that the quality of the aquatic plant community is "fair."

The 2008 macroinvertebrate survey of the lake found few macroinvertebrates, probably due to an incomplete collection of organisms rather than the lack of macroinvertebrates in the lake. The limited data indicate taxa mostly sensitive to water quality changes (typical of high water quality lakes) but no organisms associated with good water quality. Additional work will be required to fully evaluate these apparently contradictory results.

The composition of the fish community is comprised of at least five warmwater fish species, and at least four coolwater fish species. This suggests that the lake can most likely be characterized as a coolwater fishery.

Phytoplankton and zooplankton have not been evaluated through CSLAP in Silver Lake. The fluoroprobe screening samples analyzed by SUNY ESF in 2012 found relatively low algae levels and a low percentage of blue green algae. However, both overall algae and blue green algae levels increased in the fall, coincident with higher phosphorus readings.

Biological conditions in the lake are summarized in the Lake Scorecard and Lake Condition Summary Table.

Evaluation of Lake Perception

Water quality assessments were more favorable than normal in 2011 and 2012, consistent with higher than normal water clarity readings. However, recreational assessments were close to normal, consistent with aquatic plant coverage that was also close to normal in 2011 and more extensive in 2012. Recreational assessments have improved slightly since the mid 1990s, consistent with improved water quality assessments over the same period, although additional data will help to determine if this improvement continues. Water quality and recreational assessments degrade over the typical summer, consistent with the seasonally increasing lake productivity and weed coverage. This seasonal change was not apparent in 2012. Overall lake perception is summarized on the Lake Scorecard and Lake Condition Summary Table.

Evaluation of Local Climate Change

Water temperature readings in the summer index period were higher than normal in each of the last three years, but neither air nor water temperature readings has exhibited any long-term trends. It is not known if this is an indication of the lack of local climate change or if these changes cannot be well evaluated through CSLAP.

Evaluation of Algal Toxins

Algal toxin levels can vary significantly within blooms and from shoreline to lake, and the absence of toxins in a sample does not indicate safe swimming conditions. Phycocyanin readings are frequently above the levels indicating susceptibility for harmful algal blooms (HABs), although this was not as apparent from the 2012 fluoroprobe samples collected before fall. An analysis of algae samples indicated microcystin levels below the levels needed to support safe

swimming in the open water, but highly elevated readings are found in some shoreline blooms. Swimmers should avoid direct exposure to these shoreline blooms or any discolored water.

Lake Condition Summary

Category	Indicator	Min	86-12 Avg	Max	2012 Avg	Classification	2012 Change?	Long-term Change?

Evaluation of Lake Condition Impacts to Lake Uses

Silver Lake is presently among the lakes listed on the Genesee River Basin Priority Waterbody List (2002). Water supply is identified as *impaired*, and public bathing, recreation, and aesthetics are listed as *stressed*. The PWL listing for Silver Lake is listed in Appendix C.

Potable Water (Drinking Water)

The CSLAP dataset at Silver Lake, including water chemistry data, physical measurements, and volunteer samplers' perception data, is inadequate to evaluate the use of the lake for potable water. The moderate to high algae levels indicate that potable water use from the surface waters of the lake may be *impaired*, and elevated deepwater manganese readings may *impair* potable water use of the lake through deep intakes.

Contact Recreation (Swimming)

The CSLAP dataset at Silver Lake, including water chemistry data, physical measurements, and volunteer samplers' perception data, suggests that swimming and contact recreation may be *impaired* by excessive algae, shoreline algae blooms, and poor water clarity, although lake productivity was lower in the last three years, reducing the likelihood of these impacts. Additional information about bacterial levels is needed to evaluate the safety of the water for swimming.

Non-Contact Recreation (Boating and Fishing)

The CSLAP dataset on Silver Lake, including water chemistry data, physical measurements, and volunteer samplers' perception data, suggest that non-contact recreation should be supported, although this use may eventually be *threatened* by excessive weeds, particularly Eurasian watermilfoil, if surface weed growth continues to increase, as in 2012.

Aquatic Life

The CSLAP dataset on Silver Lake, including water chemistry data, physical measurements, and volunteer samplers' perception data, suggest that aquatic life may be *stressed* by hypolimnetic hypoxia (depressed deepwater oxygen readings) and the presence of invasive species, and aquatic life may be *threatened* by slightly elevated pH, although additional data are needed to evaluate the food and habitat conditions for aquatic organisms in the lake.

Aesthetics

The CSLAP dataset on Silver Lake, including water chemistry data, physical measurements, and volunteer samplers' perception data, suggest that aesthetics may be *stressed* by excessive algae, particularly the presence of blue green algae blooms.

Fish Consumption

There are no fish consumption advisories posted for Silver Lake.

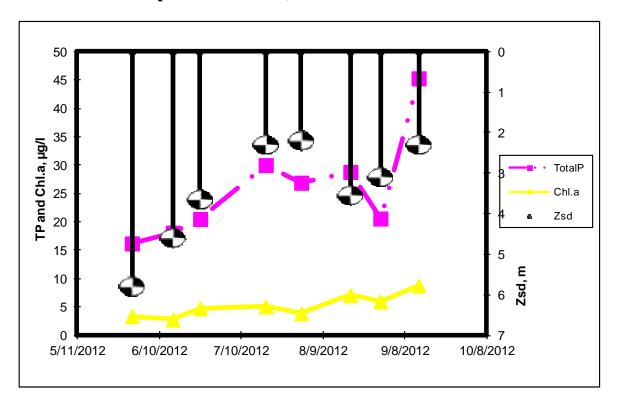

Additional Comments and Recommendations

Additional aquatic plant survey data may help to determine if the aquatic plant community is dominated by exotic plants, or if the occasional management of the nuisance weed problems in the lake has resulted in a shift to dominance by native plant species.

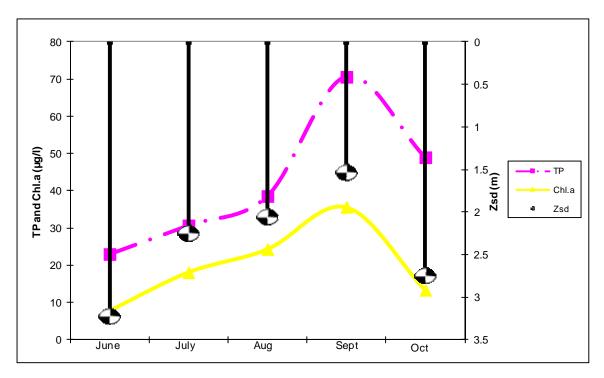

Aquatic Plant IDs-2012

None submitted for identification.

Legend Information

Indicator	Iformation Description	Detection Limit	Standard (S) / Criteria (C)
General Informa	ation	•	•
Lnum	lake number (unique to CSLAP)		
Lname	name of lake (as it appears in the Gazetteer of NYS Lakes)		
Date	sampling date		
Field Parameter	'S		
Zbot	lake depth at sampling point, meters (m)		
Zsd	Secchi disk transparency or clarity	0.1m	1.2m (C)
Zsamp	water sample depth (m) (epi = epilimnion or surface; bot = bottom)	0.1m	none
Tair	air temperature (C)	-10C	none
TH20	water temperature (C)	-10C	none
Laboratory Para	ımeters		
Tot.P	total phosphorus (mg/l)	0.003 mg/l	0.020 mg/l (C)
NOx	nitrate + nitrite (mg/l)	0.01 mg/l	10 mg/l NO3 (S), 2 mg/l NO2 (S)
NH4	total ammonia (mg/l)	0.01 mg/l	2 mg/l NH4 (S)
TN	total nitrogen (mg/l)	0.01 mg/l	none
TN/TP	nitrogen to phosphorus (molar) ratio, = (TKN + NOx)*2.2/TP		none
TCOLOR	true (filtered) color (ptu, platinum color units)	1 ptu	none
рН	powers of hydrogen (S.U., standard pH units)	0.1 S.U.	6.5, 8.5 S.U. (S)
Cond25	specific conductance, corrected to 25C (umho/cm)	1 umho/cm	none
Са	calcium (mg/l)	1 mg/l	none
Chl.a	chlorophyll a (ug/l)	0.01 ug/l	none
Fe	iron (mg/l)	0.1 mg/1	1.0 mg/l (S)
Mn	manganese (mg/l)	0.01 mg/l	0.3 mg/l (S)
As	arsenic (ug/l)	1 ug/l	10 ug/l (S)
AQ-PC	Phycocyanin (aquaflor) (unitless)	1 unit	none
AQ-Chl	Chlorophyll a (aquaflor) (ug/l)	1 ug/l	none
MC-LR	Microcystis-LR (ug/l)	0.01 ug/l	1 ug/l potable (C) 20 ug/l swimming (C
Ana	Anatoxin-a (ug/l)	variable	none
Cyl	Cylindrospermposin (ug/l)	0.1 ug/l	none
FP-Chl, FP-BG	Fluoroprobe total chlorophyll, fluoroprobe blue-green chlorophyll (ug/l)	0.1 ug/l	none
Lake Assessmen	nt	· I	
QA	water quality assessment; 1 = crystal clear, 2 = not quite crystal clear, 3 = definite algae greenness, 4 = high algae levels, 5 = severely high algae levels		
QB	aquatic plant assessment; 1 = no plants visible, 2 = plants below surface, 3 = plants at surface, 4 = plants dense at surface, 5 = surface plant coverage		
QC	recreational assessment; 1 = could not be nicer, 2 = excellent, 3 = slightly impaired, 4 = substantially impaired, 5 = lake not usable		
QD	reasons for recreational assessment; 1 = poor water clarity, 2 = excessive weeds, 3 = too much algae, 4 = lake looks bad, 5 = poor weather, 6 = litter/surface debris, 7 = too many lake users, 8 = other		
QF, QG	Health and safety issues today (QF) and past week (QG); 0 = none, 1 = taste/odor, 2 = GI illness humans/animals, 3 = swimmers itch, 4 = algae blooms, 5 = dead fish, 6 = unusual animals, 7 = other		
HAB form	HAB evaluation; A = spilled paint, B = pea soup, C = streaks, D = green dots, E = bubbling scum, F = green/brown tint, G = duckweed, H = other, I = no bloom

Appendix C- Priority Waterbody Listing for Silver Lake

Silver Lake (0403-0002)

Impaired Seg

Revised: 10/28/02

Waterbody Location Information

Water Index No: Ont 117-70-P115 Drain Basin: Genesee River

Hydro Unit Code: 04130002/160 Str Class: A Upper Genesee River

Waterbody Type: Lake Reg/County: 9/Wyoming Co. (61)
Waterbody Size: 812.7 Acres (Eutrophic) Quad Map: CASTILE (K-08-2)

Seg Description: entire lake

Water Quality Problem/Issue Information (CAPS indicate MAJOR Use Impacts/Pollutants/Sources)

Use(s) Impacted Severity Problem Documentation

WATER SUPPLY Impaired Known
Public Bathing Stressed Known
Recreation Stressed Known
Aesthetics Stressed Known

Type of Pollutant(s)

Known: ALGAL/WEED GROWTH (algal growth), NUTRIENTS, Pesticides, Silt/Sediment

Suspected: ---Possible: Pathogens

Source(s) of Pollutant(s)

Known: AGRICULTURE, Streambank Erosion

Suspected: Construction
Possible: Failing On-Site Syst

Resolution/Management Information

Issue Resolvability:2 (Strategy Exists, Needs Funding/Resources)Verification Status:5 (Management Strategy has been Developed)

Lead Agency/Office: ext/WQCC Resolution Potential: Medium

TMDL/303d Status: 3 (Waters Requiring Re-Assessment Based on New Methodology)

Further Details

The drinking water supply as well as public bathing/recreational uses and aesthetics of Silver Lake are impacted by nutrients (phosphorus) and algal growth that reduce clarity. Agricultural activities in the watershed are the primary source of nutrient loads. On-site septic systems are also an issue.

Turbidity (clarity) standards/guidance values are regularly not met in the lake and in finished waters from the drinking water treatment plant. The plant has experienced additional costs in order to meet existing standards; potential new (lower) standards are under consideration and raise concerns about the need for additional filtering. (DEC/DOW, Region 9, April 2001)

CSLAP volunteer monitoring of the lake conducted from 1986 through 1997 has documented elevated phosphorus and algal levels and reduced clarity. During the summer, lake clarity does not meet minimum recommendations (based on recommendations for siting new bathing beaches). Conditions are typical of stressed recreational uses. Although no data

is currently available, THM formation may be an issue given the algal densities in the lake. (DEC/DOW, BWM/Lake Services, April 2001)

Much of the area surrounding the lake is agricultural with high concentrations of dairy farming activity. Improper manure management (spreading on frozen or snow covered ground adjacent to the lake) and fertilizer use are the primary sources of nutrient loads to the lake. There are many on-going programs to install agricultural BMPs. Many area dairy farms fall under CAFO regulation and are working on plans to reduce and/or eliminate nutrient runoff over the next five years. Cropland soil erosion and pesticide/herbicide use are also concerns. A recent USGS study and report found pesticides to be present in the watershed, but at concentrations within applicable standards. (Wyoming County WQCC, April 2001)

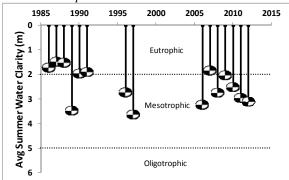

Inadequate and/or failing on-site septic systems serving the many cottages around the lake are also a suspected source of nutrients. Algal blooms appear to be less of a problem since sanitary sewers were installed in the more densely populated areas (Silver Lake and Fairview) in the mid-1980s. However, not all cottages are connected to the lake sewer district and it is suspected that many have sub-standard and failing septic systems. Construction of new residences and the use fertilizers, herbicides and pesticides on lawns (and golf courses) bordering the lake are also a concern. The Wyoming County Soil and Water Conservation District and Water Quality Committee are undertaking studies to implement non-point source BMP's, such as the construction of a sediment trap on the lake inlet. (Wyoming County WQCC, April 2001)

The lake is included on the NYS 2002 Section 303(d) List of Impaired Waters. The lake is included on Part 3 of the List as a Water Previously Listed But Requiring Re-Assessment Based on New Assessment/List Methodology.

Appendix D- Long Term Trends: Silver Lake

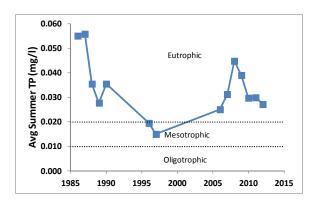

Long Term Trends: Water Clarity

- No trends apparent
- Most readings typical of *mesotrophic* to *eutrophic* lakes

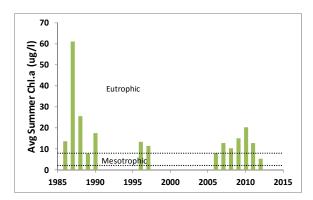

Long Term Trends: Phosphorus

- No trends apparent
- Most readings typical of *eutrophic* lakes

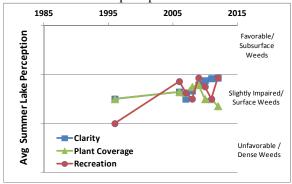

Long Term Trends: Chlorophyll a

- No trends apparent
- Most readings typical of *eutrophic* lakes

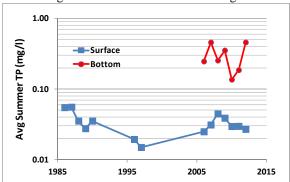

Long Term Trends: Lake Perception

- Recreational and water quality perceptions improving
- Recreational perception linked to weeds

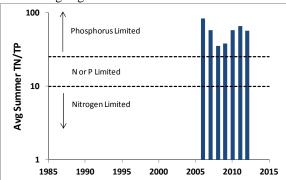

Long Term Trends: Bottom Phosphorus

- Deepwater TP levels higher than surface
- Deepwater TP readings indicates weak significant internal nutrient loading

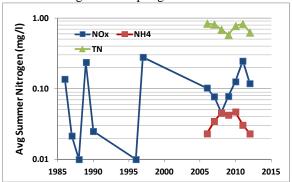

Long Term Trends: N:P Ratio

- No trends apparent
- Most readings indicate phosphorus limits algae growth

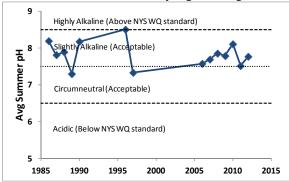

Long Term Trends: Nitrogen

- NOx readings highly variable year to year
- Low NOx, ammonia and total nitrogen during most sampling seasons

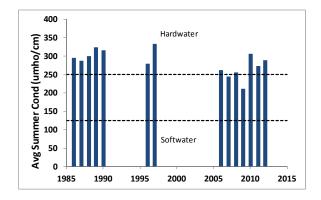

Long Term Trends: pH

- No trends apparent
- Most readings typical of *slightly alkaline* lakes with occasionally high readings

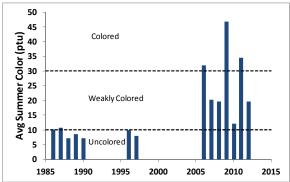

Long Term Trends: Conductivity

- No trends apparent
- Most readings typical of hardwater lakes

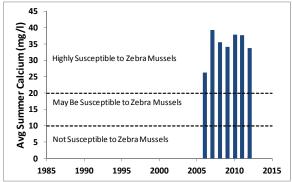

Long Term Trends: Color

- Color readings rose after 2002 shift in labs
- Most readings typical of weakly colored lakes

Long Term Trends: Calcium

- No trends apparent
- Data indicates high susceptibility to zebra mussels, which have been found in lake

Long Term Trends: Water Temperature

- Surface and bottom temperatures similar
- Bottom temperatures indicate thermal stratification usually weak
