

# Making Soils Better Tip's & Tricks To Super Charge Your Grow

## Soil Tricks:

- Cut bottom off solo cup place about 4" from plant on top of soil. Then put sand all around plant 1-2" deep to cover the area around the plant or if in pot cover the top don't put any sand in the solo cup that is where you can place your nutrients. Also gives you a place if you need test soil for moisture amount or PH. If you can find cup with top is best.
- The next thing to add into your soil is worms. Earthworms are the best for nutrients distribution. If you are adding a lot of extra organic items, you should add some red wigglers in also. If the soil stays moist and there is food the worms will stay in. They don't like any type of salts. They will not eat your roots. They eat anything organic that is rotten or not nothing living.
- Temperature don't put your soil in the sun or the freezer if you don't like the temp your soil and plant most likely won't like it either.

## Feeding Nutrients:

- To speed up the nutrient conversion process use 1 tsp of nutrients plus 2 cups of water plus 1tsp of casting and bubble for no more than 24hrs. Then water into your plants as your watering for that day.

## Watering:

- Watering in small amounts more often is better than watering large less often. When you water in large amounts, you over saturate the soil, and you wash your nutrients to the bottom or even out of the soil.

## Microbial Tea:

- When bubbling also add your weekly nutrients into the mix allow to bubble. Any left-over solids can be watered into the soil or top dressed.
