

# Global Water. Local Ice.

**ICE FOR  
WATER**

**ICE FOR WATER** is a community of ice sport athletes helping to support programs that improve water access and water quality for children everywhere.

**ONE** NHL sized ice rink uses about **10,600 GALLONS** of clean water to fill for play.

The percentage of people in the world who have access to an improved water source has **increased by 15%** since 1990, but the battle is far from over.

At least **1.8 BILLION** people worldwide are drinking water that is fecally contaminated.

More than **3 MILLION** people die annually from the consequences of water-related diseases.

The vast majority of these deaths are children under **5 YEARS OLD.**

The average ice sheet takes **90 GALLONS** to resurface. If this rink is resurfaced only 4 times each day, around **130,000 GALLONS** will be used in **ONE YEAR.** (Most rinks resurface their ice more than 8 times per day.)
