Sliding Panels System

Sliding Panels System is designed to cover large windows and to separate spaces in both residential and commercial environments. It works with 2, 3, 4 or 5 channels and with cord, wand or motor operation modes.

Sliding Panels System's stylish design hides the mechanism, creating a uniform aesthetic. It also eliminates the light gap almost completely. The fabrication and installation of the rails is simple. Additionally, head rail "splicing" is available for very wide applications and shipping.

Sliding Panels System has plastic components made of "POM" to reduce the drag and friction of the panels, resulting in better sliding and less noise.
