

What is Structured Cabling? (In Plain Language & Why You Should Care)

Structured Cabling... is defined as building or campus telecommunications cabling infrastructure that consists of a number of standardized smaller elements (structured).

A properly designed and installed structured cabling system provides a cabling infrastructure that delivers predictable performance as well as having the flexibility to accommodate moves, adds and changes; maximizes system availability, provides redundancy; and future proofs the usability of the cabling system.

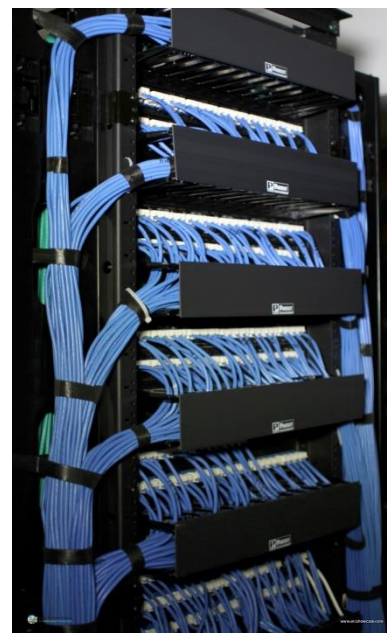

From this definition you get a good sense of what structured cabling is, as well as its purpose, value and significance.

Business dependency on communication systems has never been greater. More than 96 % of all business transactions are now initiated by telephone calls, computers, servers, routers, switches, emails, websites, voicemails, wifi, video, security, unified messaging, faxes and multimedia systems. Virtually all business is transmitted through your cabling infrastructure, and yes... That includes wireless networking systems, as well!

A properly designed & installed cabling system will probably outlive all of the other networking components in your business.

KCCi is a licensed, bonded; and insured California Contractor, (584850), able to offer warranties of up to 25-years on structured cabling.

That said, a KCCi structured cabling system represents only 7% of your total network investment. Cabling infrastructure from KCCi is a sound investment with optimum connectivity, mobility, & productivity!
