TINTING**

## WHAT IS WAXING?

Waxing is a form of semi-permanent hair removal which removes the hair from the root. New hair will not grow back in the previously waxed area for two to eight weeks, although some people will start to see re-growth in only a week. Almost any area of the body can be waxed. Including eyebrows, face, bikini area, legs, arms, back, chest, abdomen and feet.

### BENEFITS:

There are many benefits to waxing versus other forms of hair removal. It effectively removes large amounts of hair at once. It is longer-lasting than other methods, which do not remove hair at the root. Areas that are waxed frequently have lighter, slower re-growth rates.

### WHAT TO EXPECT:

Waxing is accomplished by spreading a thin coat of warm wax over the skin. A cloth or paper strip is applied and pressed firmly, adhering to the wax.

The strip is then quickly pulled away against the direction of hair growth, removing the hair along with the wax. Removal works best when hair has grown out for 2-3 weeks.

### CONTRAINDICATIONS:

The following factors may result in “skin lifting,” where the top layer of skin is removed during waxing.

- Taking blood thinners, steroids, drugs for auto-immune diseases or acne, Psoriasis, eczema or other skin diseases
- Recent sunburn, laser treatment, surgical peel, microdermabrasion, reconstructive or cosmetic surgery, any chemical or prescription peel product, hydroquinone
- Chronic skin conditions including psoriasis or eczema, rosacea or sensitive skin, severe varicose veins
- History of fever blisters or cold sores

## WHAT IS ELECTROLYSIS?

During electrolysis an electric current is applied to each hair follicle. This process destroys the root and prevents the re-growth of unwanted hair.

### BENEFITS:

Electrolysis hair removal is the only method approved by the FDA for permanent hair removal.

This method benefits many people who have not had success with laser hair removal.

### WHAT TO EXPECT:

An electric current is applied with a very fine needle-shaped electrode, or metal probe into each hair follicle to destroy the root. Because hairs grow at different rates, multiple sessions may be needed to get each hair in the growth stage. Permanent hair removal is not guaranteed.

## WHAT IS LASH & BROW TINTING?

Eyelash and brow tinting is a process where the hairs are dyed to make them darker, enhancing them and reducing the need to apply make-up.

### BENEFITS:

Lash and brow tinting is particularly beneficial for people who demonstrate sensitivity to make-up, are active in sports, and those who just don't have the time or inclination to apply make-up every day.

### WHAT TO EXPECT:

The technician will apply a thin coat of petroleum jelly around the area to be tinted to prevent the dye from staining the skin. A small amount of dye will be applied to the lashes/brows.

Then comes the hard part...you relax.

After about 10 minutes, the technician will remove the dye from around the eyes with water and you are good to resume your day.

Eyelash tinting is completely safe. Occasionally, however, slight tearing of the eyes will cause some dye to get into the eyes and cause some stinging. If this occurs, continue to rest quietly and tell the technician.

This service may not be suitable for anyone who has had a reaction to hair coloring. If this is a concern, contact us for a consultation.

### WHY TINT OR SHAPE YOUR BROWS:

A good arch lifts the eye, creating a younger and more polished appearance.
