

“We began using Agra-Rouse last spring. Our 36-hole facility has Champion and Tif-dwarf green surfaces. Both surfaces are over-seeded in the winter. The water source available is effluent and transition has always been a challenge. We strongly considered using several light herbicide applications to remove the over-seed competition.

However, once adding Agra-Rouse to weekly spoon feed fertilizations the turf became so healthy, herbicide applications were not needed to aide in transition.”

Matthew Fitzpatrick, Golf Course Superintendent, Golf Club at Indigo Run

“Monthly applications of KaPre ExAlt + VermaPlex + Pennamin High K seem to have helped us produce a more stress-tolerant turf while at the same time providing a great environment for our soil biology to flourish. We have seen our no-till layer disappear in the last 6 months, and our turf is more reactive to foliar applications and able to sustain great color for longer periods of time. This application is a must for my program when the soil is active from March through November here in Greensboro, North Carolina.”

Keith Wood, Golf Course Superintendent, Sedgefield Country Club

"We incorporated agra-Rouse into our spray program three years ago. Right away we could tell that the greens were putting faster and smoother. Our Champion greens now have a stronger root system and a tighter vertical putting surface. The greens are simply healthier. We love this product."

Bryan Barnard, Golf Course Superintendent, Cleghorn Country Club Plantation

*November 4, 2011*

“I'll second those statements from Keith Wood, Sedgefield Country Club, without a doubt. Those apps are a mainstay in our program, and we could not do without them. We have tried many different types of foliar apps and have found that ExAlt + VermaPlex and Agra-Rouse with Pennamin have helped us during our grow-in and in the 14 weeks since we started the project. As you are aware, we started our grow-in in tough summer conditions on June 26, 2013 when we planted our greens. We had 5.5 inches of rain 2 days later, and of the 8 weeks of grow-in, we had 11.5 inches of rainfall and 15 days of sunlight, with only 2 of those days over 90 degrees. With help from George Frye and David Powell with what they recommended, we came through a tough time with very little stress. So without a doubt, these products are the life-blood of our program.”

Tim Davis, Golf Course Superintendent, Cabarrus Country Club
