

Physical Therapy

As physical therapists in a pediatric setting, we assist children in developing and enhancing mobility so that they can safely participate in activities at home, in the community, classroom and on the playground. At TLC, your child will have a complete assessment by a board-certified physical therapist who will then customize a treatment plan and goals to meet their specific needs. Physical therapists address stationary skills, gross motor skills, balance, coordination, posture, and neuromuscular development. Physical therapy promotes mobility, function and quality of life in young patients with a variety of congenital, developmental, neuromuscular or skeletal disorders. For children, part of the physical therapy plan is to incorporate parents and family for increased carry over of treatment. At TLC, we are able to provide a variety of treatment techniques and modalities in a safe environment for your child.
