

Parental Rights & Mental Health Fact Sheet

Learn the truth about the mental health industry, psychiatric drugs, electroshock and coercive psychiatric practices.

Why is Mental Health in Our Schools?

Schools are sidestepping parents in mental health treatment and curriculum. Elementary-aged kids are being forcibly sent to mental health wards and covertly enrolled in mental health programs at schools. Although school officials might genuinely care about protecting children, it is parents who have the right to direct the mental health of their children.

"Every child in America entering school at the age of five is insane because he comes to school with certain allegiances to our founding fathers, toward our elected officials, toward his parents, toward a belief in a supernatural being, and toward the sovereignty of this nation as a separate entity. It's up to you as teachers to make all these sick children well – by creating the international child of the future."

**Psychiatrist Chester Pierce addressing the
Childhood International Education Seminar, 1973**

A Model for Successful Change

Helping children in crisis and reducing youth suicide are two areas of concern that everyone agrees must be addressed. Unfortunately, the solutions of the past have not worked. But something has worked, guaranteeing a parent's right to direct the mental health of their children and the removal of the mental health agenda-based education system from schools. Florida passed legislation in 2021 which clearly states that a parent has the right to direct the mental health of their children. That same year legislation passed helping to stop children being taken into custody for an involuntary psychiatric examination at their schools. Additional changes made in 2022 concerning parental rights in education resulted in FL prohibiting the use of mental health industry based social emotional learning in schools. Since these changes were made, the youth suicide rate is finally beginning to decline.

Key Facts

- ***Growing numbers of children and adolescents are being prescribed multiple psychiatric drugs to take simultaneously. The phenomenon is increasing despite warnings that psychotropic drug combinations in young people have not been tested for safety or studied for their impact on the developing brain.***
- ***Prescriptions for the antidepressant fluoxetine (Prozac) increased 23 percent in one year in children 2 and under.***
- ***Over 6 million children in the USA were prescribed a psychiatric drug in 2020.***
