January 2016

The company successfully carried and completed two full scale tests of the in-situ leaching (ISL) of uranium at the Kamushanovsky deposit in the period of June-November 2015. All works on the Polygon 1 and 2 proved that the technology of in-situ recovery (ISR) could be used on the peat deposit.

Bi-carbonate solution was injected to the Polygon 2 and pumped up. Pregnant solution went through the column with anion exchange (resin). Uranium settled on the resin. Absorption column with 45 kg of resin absorbed almost 2 kg of uranium in 7 days. The resin was moved to Karabalta laboratory and the first yellow cake (U₃O₈) was produced from it.

The company plans to start production using ISL in 2017-18.

Thank you.

Regards,

Sergei Khokhlov

CEO
