

**Capturing Spring**  
Sienna Lewis and Olivia Beck

# Project Statement

The Capturing spring Hotel is located next to some of Genova's best well known points: Porta Soprana and Christopher Columbus' house. As such, the project is aimed at creating a premium experience for all who choose to stay in it. The creation of warmth embraces guests they seek comfort during the winter and provides a refreshing space to be during the heat of the summer. On the piazza level, an environment that envelopes them in trees serves as the welcoming space for guests as well as members of the public who visit to engage in shopping or dining. A children's playground, a rarity in the city of Genova makes the statement that the hotel is for all stages of life and activates the piazza space, making it a place where both adults and children may want to spend their day. Its double-skin façade creates moments of either interior or exterior focus through the use of varying opacities of frosted glass. Spaces with more opaque glass are graced by a glow that enlivens the interior while blurring any view to the exterior. Naturally, this effect creates a focus on the happenings within said space as well as privacy where it is needed (hotel rooms). Areas with more transparent glass allow views outside for guests to witness and enjoy the activity of the sprawling piazza outside, welcoming them to life in Genova.

# Energy Management

Capturing spring was born of the idea of a dwelling space inside a warm greenhouse. It makes use of a double skin glass façade that maximizes daylighting in its somewhat obscure site, Piazza Dante, Genova. This skin system harnesses the heat trapped by glass enclosure, using it as insulation during the winter and opening in the summer to facilitate stack ventilation and wind tunnel effect. Trees and shrubbery on the ground level, all sustained by collected rainwater, are used for air purification while the shell is closed, solving the potential problem of stale air. During the summer, the soil from those trees also allows for evaporative cooling. With maximized use of natural lighting, and passive temperature control, Capturing Spring minimizes its carbon footprint by reducing the power it takes off the grid. It is powered by Spring.

# Precedent Analysis

Faculty of Economics, University of Basel

Architekten Basel Zürich & Jakob Steib Zürich

Site plan shows orientation of building. seems to be deliberately oriented with openings against main wind direction. Diagram above shows tunnel effect running SE to NW. Prevailing windflows in the exact opposite direction.

Circulation through this building takes place in enclosed spaces, some open to the sky, and others fully covered. A series of intersecting pathways and the manipulation of ceiling height creates opportunity for interesting airflow.

## Site Section

# Site Analysis

## Heat

January is the coldest month of the year.  
Average temperature is of 9.1 °C (48.3 °F)

August, the hottest month of the year  
The average temperature is of 25.1 °C (77 °F)

Original Site Plan

# Energy Usage

Minimized energy use for temperature control

Typical enclosed area of building

Building form to allow wind ventilation and minimal power usage

Shorter, smaller enclosures  
Cooling/ Heating Load 85% Lower

High glass roof

enclosed space including hallways

Shorter ceiling under glass enclosure

Smaller masses to cool

Form Evolution

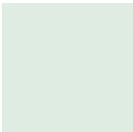

# Massing

# Program

 **Public Spaces:**  
Lobby, guest services, waiting  
area, executive center

 **Hotel Rooms**

 **Public Spaces Lower Levels:**  
Restaurants, cafes, retail

 **Circulation**

 **Back of House:**  
Management offices, laundry,  
janitorial, luggage storage  
room

Underground deliveries and  
garbage removal, service  
rooms

# Structural Grid

## Structural Axonometric

Structure is composed of two different grid systems to allow for light corridors.

Long Section

# Solar Response

# Solar Response

## Light Corridor

Gap through the center of the project allows for a wind and light corridor, distributing light to the spaces below.

the first floor is also open to glass which encourages more light to reach the vegetation of the first floor.

# Temperature Analysis

## Open Shell: Summer Solstice

Wind tunnel effect cools on average 7 degrees Fahrenheit  
vegetation cools a space by 2 to 9 degrees Fahrenheit

Average temperature inside shell  
73F or 22.78C

Average temperature outside  
shell 80.6F or 27C

# Temperature analysis

Closed Shell: Winter Solstice

Average temperature inside shell  
78 degrees Fahrenheit

Average temperature outside shell  
48 degrees Fahrenheit

# Energy Management Strategies

Water collection on roof

Shell opens to allow for balconies

Operable shell to allow for ventilation

Green wall at base of project
