

FELINE (CATS) VACCINE SCHEDULE:

FVRCP (Feline Rhinotracheitis [Herpes], Calicivirus, Panleukopenia):

- 6 weeks of age.
- 9 weeks of age.
- 12 weeks of age.
- 1 year.

RABIES:

Kittens are generally vaccinated once around 4 months of age or within their first year of life.

This vaccine is valid for 1 year after its first administration. After this, cats are eligible for a 1 year or a 3-year vaccine.

CAININE (DOGS) VACCINE SCHEDULE:

DHPP is a canine vaccine that prevents distemper, parvovirus, parainfluenza, and two types of adenovirus (hepatitis).

Dogs should receive the DHPP vaccine at 7, 10, and 13 weeks, (then at 16 weeks if puppy lives outside with multiple dogs or in public) one year later after puppy series above, and then 1 to 3 years after that.

Rabies can be given at 4 months or up to one year. Regardless of the age of the animal at primary immunization, a second rabies vaccination should be given one year later, and the three-year booster schedule followed thereafter.

Bordetella

Puppies should receive the injectable version of the Bordetella vaccine or oral between the ages of six to eight weeks. They should then receive a second injectable booster four weeks later, or between the ages of 10 to 12 weeks.

Oral and nasal Bordetella is also available.
