

Boise Microblading and Lashes

AfterCare Instructions

-Water cannot come in contact with the affected area for **3 days** after microblading, even a small drop can expand a wound and a scab can appear and/or cause an infection or loss of pigment retention.

-**After** 3 days, you can use a gentle cleanser to keep your brows clean.

-**IF** dryness occurs and **ONLY** after the 3rd day, you can moisten the area by using a small amount of tattoo goo that will be provided to you. Make sure your brows are not greasy, just slightly moist; no residue of oil should appear.

-Brows may appear much darker within the first week after microblading.

-30-50% of the pigment will usually fade in darkness and/or be completely lost before the scheduled touch-up. At the 4-6 week touch up, any lost pigment will be filled in.

-Avoid Vaseline, ointments, or creams with antibiotics on the brow area.

-No sunbathing, or tanning for 4 weeks.

-No chemical peels, dermabrasion, RetinA, Renova, Alpha Hydroxy and Glycolic Acids or any other intense treatments for 4 weeks.

-Do not use any makeup on affected area for 2 weeks.

-Do not scratch, touch or sleep on your brows for at least 2 weeks.

-No heavy workouts for 7 days. Avoid heavy sweating.

-Don't panic if dry patches or scabs appear as this can be taken care of in the second touch-up appointment.

Note that because of natural skin regeneration, after recovery period, brows may appear lighter. Often even with proper care, customers develop bald spots or loose original brow strokes which makes brows look uneven. It is absolutely normal because your natural skin regeneration is not a process the technician can control.
