

How it works - Cómo funciona

NFC cards use the same technology as contactless payments. When you tap the card against a smartphone, your digital profile opens instantly — no app, no installation.

This is how it works:

- **Tap** the card against a phone
- **Read**: the phone scans the NFC chip
- **Show**: your profile appears immediately (contact info, social media, links)
- **Save**: the receiver stores your details with one click

No charging, no Bluetooth, no QR codes. Just **one tap**.

How to program your card - Cómo programar tu tarjeta

Setting up your NFC card takes less than a minute.

1. **Open an NFC writer app** (e.g., *NFC Tools* for iPhone/Android)
2. **Select “Write”** Add the link you want the card to open — your profile, Instagram, WhatsApp, website, or digital business card.
3. **Tap the card against your phone** The app writes the link into the chip.
4. **Done** Test it by tapping the card against a phone — your profile opens instantly.

You can change the link anytime. The card is **fully rewritable**.

Note: NFC cards can only open **one single action** when scanned — for example a website link. If you want to show **multiple pieces of information** (phone number, email, WhatsApp, social media, business details, discount codes, videos, etc.), you can use a free service called **Linktree**.

With Linktree you create **one page** that contains **all your information**. Then you simply write **your Linktree URL** to the NFC card using the NFC Tools app.

When someone taps your card, their phone opens your Linktree page automatically — **no app required for the person scanning the card**. Linktree is **free to use** and can be updated anytime without rewriting the NFC chip.
