Together,
we could breathe
new life into

COPD
care

Living with chronic obstructive pulmonary disease (COPD) can be hard. But, by working together, we might be able to improve the quality of life for those living with the disease.

That's why we're looking for diverse volunteers to join over 1,200 people to take part in a global clinical trial that will assess how safe and effective a new investigational drug is in reducing COPD flare-ups or exacerbations.

Please see reverse side for more information.

Who can take part in the study?

This study aims to recruit approximately 1,290 people who:

- Are between the ages of 40 and 80 years old
- Have been diagnosed with COPD for at least 1 year
- Have had two or more moderate or severe exacerbations in the last year
 - A moderate COPD exacerbation needs treatment with steroids and/or antibiotics
 - A severe COPD exacerbation leads to hospitalization (for more than 24 hours)
- Are a current tobacco smoker or former smoker

What is an exacerbation?

COPD can worsen over time or suddenly get worse. When COPD suddenly worsens, it's known as an exacerbation. Existing treatment options together with lifestyle changes can help to manage COPD symptoms. But having frequent COPD exacerbations can affect how well the lungs work and is linked to a worsening quality of life. Therefore, better treatments are needed to help reduce the number of COPD exacerbations.

If you or someone you know are interested in taking part, or if you'd like more information, please speak to your physician or contact the study team on the details below.
