

The Balanced Claw Rig

The Balanced Claw Rig itself is not a new concept, but it brings together different elements of other established rigs and presents them in a different way. The aim of the rig is for it to be critically balanced by using a combination of rig swivels, when attaching the pop-ups, and the QC ring swivels, when attaching the hooks, and also in combination with a sinking braid, either with a shot on it or using tungsten putty on the swivel to get the balance right, but the shot and the putty are not always necessary. However, a 25-30lb **sinking** braid is essential, so be careful what you use; a better alternative is to use a 30lb fluorocarbon boom.
