A couple of charts from our 2025 bluegill sampling of Atwood Lake. Still continuing to see an increase in 7 inch and larger bluegills in our catch. Also saw a slight increase in our 3-6 inch bluegill catch. This is very similar to what we saw on Wall Lake once we put walleyes in. There was a huge drop in bluegill catch following the year of initial walleye stocking, and then after a couple of years we started to see our catch of 3-6 inch bluegill increase. However, our catch of bigger bluegill has remained high over there. This similar trend will likely yield similar results for Atwood. I really appreciate the efforts of the association to raise funds for this program. Positive results are showing.
