

LASER PRO AND WOBBLER

A REVIEW BY NICK SISLEY

It's often said – practice makes perfect. So what can be better than practicing your stance, mount and swing in your own home without firing a single shot.

From Bob Foegen and the Robert Louis Company comes the Laser Pro moving target projector

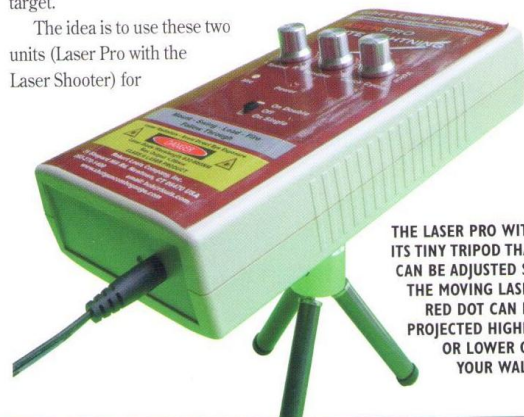

and accompanying Wobbler True Target Oscillator. The Laser Pro can be used by itself, it sits on a tiny tripod and sends out a red laser light (simulating a target) that repeatedly moves across your wall at home (or wherever you have set the unit up). You can adjust the height of the simulated target up and down by adjusting the tripod and there are also adjustments that allow speeding up or slowing down of the red laser light's movement.

The Red Laser Shooter laser light is used in conjunction with your favorite sporting clays gun. Similar to a flashlight, it slips into the muzzle of your gun (you must of course be doubly certain the gun is not loaded!). Next there's a wire attached to the Laser Shooter in the gun's muzzle – to a soft

metal adjustable ring that you attach to your finger. Just touch the soft metal on your finger to the trigger to simulate firing – with the Laser Shooter red dot from the barrel instantly on your wall as your gun tracks the simulated target.

The idea is to use these two units (Laser Pro with the Laser Shooter) for

constant practice – with no recoil and no cost – other than the cost of the two units (which are packaged together). As the moving red light target appears on your wall, start the swing, mount and execute the shot as you would out on a

THE LASER PRO WITH ITS TINY TRIPOD THAT CAN BE ADJUSTED SO THE MOVING LASER RED DOT CAN BE PROJECTED HIGHER OR LOWER ON YOUR WALL.

sporting course. When the lead looks correct, just touch the trigger (don't pull it). The laser light suddenly projected from your gun's muzzle tells you whether you were in front, behind, over or under the target. The suggestion is to complete this practice over and over – daily, weekly, whatever – to develop your skills of good gun mount on an actual moving target along with the necessary lead.

Wobbler

The Wobbler is a separate unit. It attaches to the Laser Pro – right into the tripod socket (the tripod is removed for use with the Wobbler). There's an adjustable arm between the Wobbler and the Laser Pro that permits elevation change, but the main thing the Wobbler accomplishes is oscillation.

Consequently, the simulated target moving across your wall is constantly changing as the Wobbler changes elevation. For example, the target might start low – then move upward – or vice versa. Further, the Laser Light from the Laser Pro never starts at the same place nor finishes in the same plane.

When the Wobbler is added to the Laser Pro mix, in conjunction with the muzzle-fit Laser Shooter, this is where simulated targets of all manner can be thrown – rising, falling, near overhead and more.

The Laser Shooter that fits the gun's muzzle comes with interchangeable 12, 20, 28 and .410 sleeves so you can use any gauge gun for your indoor practice, whether it be Sporting or FITASC. Before starting any practice session, make sure the Laser Shooter in the gun's muzzle is

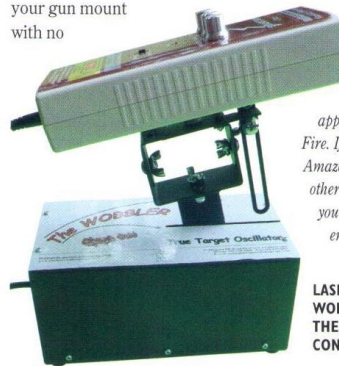

lighting up right where you're looking/pointing. There are adjustments for this.

Finally, the Laser Pro also comes with a target. Mount it on a wall. Practice with the Laser Shooter in the gun's muzzle – mounting your gun on this target. With practice, you can perfect your gun mount with no

muzzle dipping in the mount while also eliminating other gun mounting issues – all in your own home before the next season even gets started. ■
