Health Report

How to interpret Big Bubba's genetic health results:

If Big Bubba inherited any of the variants that we tested, they will be listed at the top of the Health Report section, along with a description of how to interpret this result. We also include all of the variants that we tested Big Bubba for that we did not detect the risk variant for.

A genetic test is not a diagnosis

This genetic test does not diagnose a disease. Please talk to your vet about your dog's genetic results, or if you think that your pet may have a health condition or disease.

Increased risk result

Protein Losing Nephropathy, PLN

Big Bubba inherited both copies of the variant we tested for Protein Losing Nephropathy, PLN

Big Bubba is at increased risk for PLN

How to interpret this result

Big Bubba has two copies of a variant in the NPHS1 gene and is at risk for developing protein losing nephropathy. Please consult with your veterinarian for further diagnostics and a long term care plan for Big Bubba.

What is Protein Losing Nephropathy, PLN?

Protein Losing Nephropathy causes inappropriate loss of protein in the urine. Certain parts of the kidney act as a sieve where ions, small molecules like urea, and water are filtered out of the blood into the urine. In PLN, the sieve is compromised and protein moves in the urine. This leads to muscle wasting, abnormal fluid accumulation in the skin and limbs, and kidney failure.

When signs & symptoms develop in affected dogs

PLN has an adult onset.

Signs & symptoms

Affected dogs exhibit muscle wasting, abnormal accumulation of fluids in tissue (usually first observed as edema in the limbs), and excessive thirst and urination. PLN dogs are at high risk of clotting problems due to a loss of clotting proteins. Finally, excessive protein is toxic to the kidney, so dogs develop signs of kidney failure: vomiting, poor appetite, lethargy, and changes in thirst and urination.

How vets diagnose this condition

PLN is diagnosed through genetic, urine and blood testing. Additional tests, including blood pressure and abdominal ultrasound, may be recommended based on your dog's clinical signs. There are secondary causes of PLN not associated with genetic mutations.

How this condition is treated

Current therapies for PLN are aimed at reducing the protein load on the kidney and fighting the toxic effects of protein wasting. Dietary and medication recommendations are based on how clinically advanced the PLN is. Dialysis, kidney transplants, and gene therapy are being explored as potential treatment options.

Actions to take if your dog is affected

- Regular veterinary visits and laboratory testing will be vital to catching this disease in any early stage where it can be more easily managed.
- Closely monitor your dog for changes in their drinking and urination patterns.

Notable result

ALT Activity

Big Bubba inherited one copy of the variant we tested for Alanine Aminotransferase Activity

Why is this important to your vet?

Big Bubba has one copy of a variant associated with reduced ALT activity as measured on veterinary blood chemistry panels. Please inform your veterinarian that Big Bubba has this genotype, as ALT is often used as an indicator of liver health and Big Bubba is likely to have a lower than average resting ALT activity. As such, an increase in Big Bubba's ALT activity could be evidence of liver damage, even if it is within normal limits by standard ALT reference ranges.

What is Alanine Aminotransferase Activity?

Alanine aminotransferase (ALT) is a clinical tool that can be used by veterinarians to better monitor liver health. This result is not associated with liver disease. ALT is one of several values veterinarians measure on routine blood work to evaluate the liver. It is a naturally occurring enzyme located in liver cells that helps break down protein. When the liver is damaged or inflamed, ALT is released into the bloodstream.

How vets diagnose this condition

Genetic testing is the only way to provide your veterinarian with this clinical tool.

How this condition is treated

Veterinarians may recommend blood work to establish a baseline ALT value for healthy dogs with one or two copies of this variant.

Genetic Diversity and Inbreeding

Coefficient of Inbreeding (COI)

Genetic Result: 33%

Our genetic COI measures the proportion of your dog’s genome (his genes) where the genes on the mother’s side are identical by descent to those on the father’s side. The higher your dog’s coefficient of inbreeding (the percentage), the more inbred your dog is.

Your Dog’s COI

This graph represents where your dog’s inbreeding levels fall on a scale compared to both dogs with a similar breed makeup to him (the blue bars) and all purebred dogs (the grey line).

Genetic Diversity and Inbreeding

More on the Science

Embark scientists, along with our research partners at Cornell University, have shown the impact of inbreeding on longevity and fertility and developed a state-of-the-art, peer-reviewed method for accurately measuring COI and predicting average COI in litters.

About Embark

Embark Veterinary is a canine genetics company offering research-grade genetic tests to pet owners and breeders. Every Embark test examines over 200,000 genetic markers, and provides results for over 250 genetic health conditions, breed identification, clinical tools, and more.

Embark is a research partner of the Cornell University College of Veterinary Medicine and collaborates with scientists and registries to accelerate genetic research in canine health. We make it easy for customers and vets to understand, share and make use of their dog's unique genetic profile to improve canine health and happiness.
