Rectification Methods: True RMS and Mean

There are two methods for converting current into RMS values: the true RMS method (true RMS value indication) and the mean method (mean rectification RMS value indication). Although both methods yield the same value for undistorted sine waves, distortion of the waveform causes the values to diverge.

True RMS RMS value method (true RMS value indication)

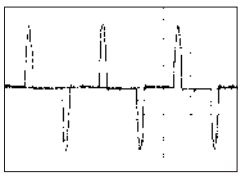

The waveform including harmonic components is calculated according to an RMS calculation formula and displayed.

MEAN Mean method (mean rectification RMS value indication)

The input waveform is treated as an undistorted sine wave (single frequency only). The AC signal mean is calculated, converted to an RMS value, and displayed. The measurement error increases when the waveform is distorted.

*Widespread use of equipment such as inverter devices and switching power supplies has made it more common for current waveforms being measured to be distorted. It is recommended to use a measuring instrument that uses the true RMS method to ensure accurate measurement.

Accuracy and Tolerances

● *f.s.* *(maximum display, or length of scale, ...full-scale)*

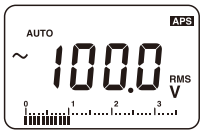

Signifies the maximum display (scale) value or the length of the scale (in cases where the scale consists of unequal increments or where the maximum value cannot be defined). In general, this is the range value (the value written on the range selector, or equivalent) currently in use. However, be aware that in cases where the maximum display value is 2000V but the range value is only 600V, the maximum display value (scale value) is still used as the f.s. value.

300V range

● *rdg* *(displayed or indicated value, ... reading value)*

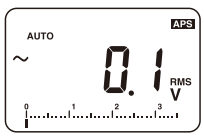

This signifies the value actually being measured, i.e., the value that is currently indicated or displayed by the measuring instrument.

Measuring 100 V using the 300 V range

● *dgt* *(digital resolution, ... digit)*

Signifies the smallest display unit on a digital measuring instrument, i.e., the value displayed when the last digit on the digital display is "1". Essentially, this indicates an error of 1 digit (based on decimal processing in analog-to-digital conversion), but in actuality this is the digit error combined with the f.s. error converted to a fraction of a digit unit. The accuracy associated with a particular measured value as shown in the product specifications is derived from these values.

In the 300 V range, the 0.1 V digit is the smallest digit

Example accuracy calculations

[Example accuracy calculation 1] (when the accuracy notation combines rdg and dgt)

Accuracy specification: ±1.0% rdg ±3 dgt
Measurement range: 300.0 V
Measured value: 100.0 V

Since the value being measured is 100.0 V:
(A) Reading error (±% rdg): ±1.0% of 100.0 V = ±1.0 V
(B) Digit error (dgt): Since the maximum resolution is 0.1 V, ±3 dgt = ±0.3 V
(C) Total error (A+B): ±1.3 V
Based on the total error (C), the error boundary values for a measured value of 100.0 V would be 98.7 V to 101.3 V.

[Example accuracy calculation 2] (when the accuracy notation combines rdg and f.s.)

Accuracy specification: ±0.2% rdg ±0.1% f.s.
Measurement range: 300.00 V
Measured value: 100.00 V

Since the value being measured is 100.00 V:
(A) Reading error (±% rdg): ±0.2% of 100.00 V = ±0.20 V
(B) Full-scale error (±% f.s.): ±0.1% of 300 V = ±0.30 V
(C) Total error (A+B): ±0.50 V
Based on the total error (C), the error boundary values for a measured value of 100.00 V would be 99.50 V to 100.50 V.

This Electrical Measuring Instruments General Catalog provides a product outline. For more detailed information, please refer to individual product catalogs and series catalogs, which group together similar products.

To help you use measuring instruments safely, the following information is provided in each product's Instruction Manual under "Specifications":
• Rated voltage to ground: The measurement point's voltage level relative to ground, Measurement Category, Anticipated transient overvoltage, etc.
• Location for use: Pollution Degree 2, indoor, altitude no more than 2000 m, etc.

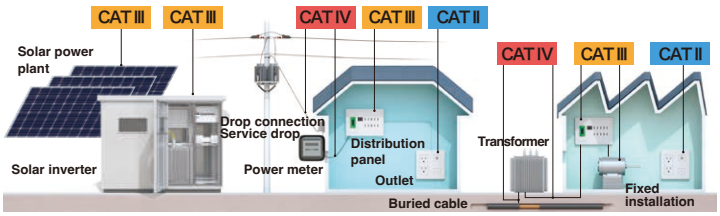

Measurement Category

Under safety standards (EN61010 Series, JIS C 1010 Series), measurement is classified into Categories II to IV according to the measurement point's rated voltage to ground, current capacity (size of current that flows in a short-circuit fault), etc., and the transient overvoltage that occurs at the measurement point.

- **•Category II** Measurement at a point from the power plug to the equipment's power circuits, where equipment is directly connected to an outlet.
- **•Category III** Measurement at a point on the power distribution cabling or power supply circuits, or at a point from the distribution panel to a distribution terminal behind an outlet, where equipment (for example a fixed installation) takes electricity directly from a distribution panel.
- **•Category IV** Measurement at a point on a service drop to a building, or on the line from the drop connection to the power meter or distribution panel.

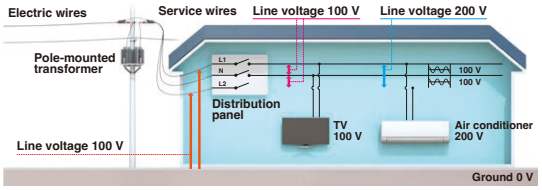

The measurement instrument's Category is marked as "CAT II", CAT III" or "CAT IV" near the measurement terminals.

Measurement Category

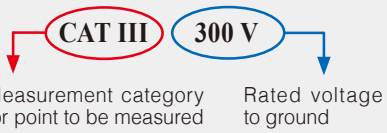

Rated voltage to ground

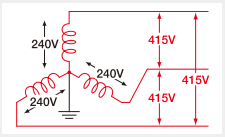

This illustration shows the case of single-phase 3-wire system, 100 V line.

How to read a category indication

Three-phase three-wire (3P3W) system, 400 V line

*** Voltage indications**
Black: voltage to ground (including line-to-line voltage)
Red: line-to-line voltage

With the 400 V line in the figure, the line-to-line voltage is 415 V, whereas the voltage to ground is no more than 240 V (300 V).

Never measure a measurement point with a higher category number than the category indicated on the measuring instrument. Doing so could lead to a serious accident such as electric shock.

Anticipated Transient Overvoltage

Power lines in factories and similar facilities will at times include transient overvoltage (impulse voltage) that is around 10 times the power source voltage. The transient overvoltage of the measurement points must be predicted in advance, and the instrument will need a safety design that will enable it to withstand such overvoltage.

Assuming 600 V for the measurement point's voltage to ground, a Category IV location could potentially include transient overvoltage of 8000 V.
Hence, CAT IV measurement instruments are designed to withstand transient overvoltage of 8000 V.
CAT III measurement instruments can only withstand up to 6000 V, so if 8000 V transient overvoltage enters, it will cause insulation breakdown that could result in electric shock.

Safety standards stipulate values such as the following for transient overvoltage, according to the voltage to ground and the measurement category.

Rated voltage to ground [V]	Transient overvoltage [V]		
	CAT II	CAT III	CAT IV
300	2500	4000	6000
600	4000	6000	8000
1000	6000	8000	12000
1500	8000	10000	15000
2000	12000	15000	18000

Pollution Degrees

If contaminants adhere to the surfaces of a measuring instrument, its insulation performance will fall and it will pose a high risk of electric shock.
Safety standards classify environments where measuring instruments are used into Pollution Degrees 1 to 4.

- **Pollution Degree 1**
  Environment with no pollution, or with only dry contaminants present (non-conductive dirt, dust, etc.), which will not affect a measuring instrument's insulation performance.
- **Pollution Degree 2**
  Environment with only dry contaminants present (non-conductive dirt, dust, etc.), but where condensation could form on a measuring instrument, in which case the contaminants could cause a temporary drop in its insulation performance.
- **Pollution Degree 3**
  Environment with conductive contaminants present (water, soil, etc.), and which therefore could affect a measuring instrument's insulation performance, depending on how (much) contaminant adheres to it. Or, environment with high humidity, where even non-conductive contaminants could be a problem, since due to condensation a measuring instrument could have wet surfaces for relatively long periods.
- **Pollution Degree 4**
  Environment that could cause a prolonged drop in a measuring instrument's insulation performance, due to conductive contaminants (water, soil and the like) adhering to its surfaces, or to being wetted by rain.

A "Pollution Degree 2" marking on a measurement instrument means that it can be used without detriment to safety in environments of Pollution Degree 1 or 2 described above,, and a "Pollution Degree 3" marking means the measurement instrument can be used in environments of Pollution Degrees 1 to 3.

Altitude

As altitude (elevation) rises, the air pressure decreases and flashover (breakdown and discharge through the air) becomes more likely to occur.
Accordingly, safety standards stipulate safety design that assumes use locations of altitude no more than 2000 m for measuring instruments.
If measuring instruments are used in locations of altitude exceeding 2000 m, the spaces between their parts that are under hazardous voltage and their parts that humans touch should be made larger as a precaution.

Cut your measurement time dramatically compared to older methods

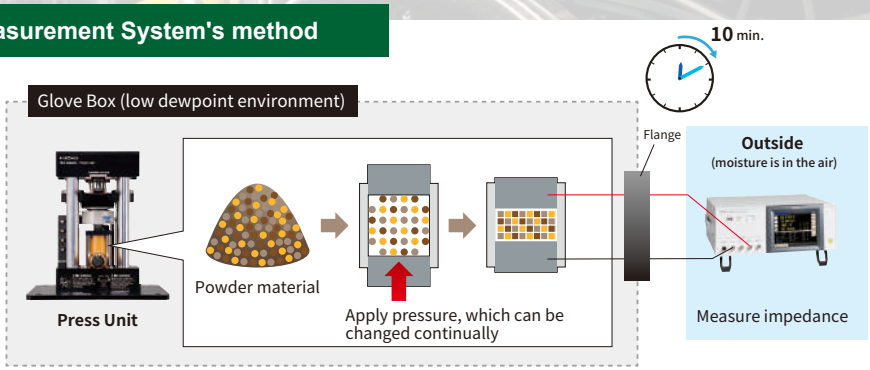

Conventional methods

Every time you want to measure:
- With a different pressure, you must refill the test cell with a new sample
- You must take the cell in and out of the glove box

Hioki Powder Impedance Measurement System's method

You can measure impedance while repeatedly changing pressure on the same sample and in the glove box. This dramatically reduces work time, cost, and toxic gas risk.

**1: The thresholds for determining the pass/fail condition of a battery depends on the specifications and standards of the battery manufacturer, battery type, capacity, etc. It is important and necessary to always conduct battery testing against the internal resistance and terminal voltage of a new or reference battery. In some cases, it may be difficult to determine the deterioration state of traditional open type (liquid) lead-acid or alkaline batteries which demonstrate smaller changes in internal resistance than sealed lead acid batteries. *2: Audio generated by Bluetooth®-connected device. *3: Data can be downloaded to tablets and smartphones using Hioki's dedicated apps available from the Google Play or App Store. Key Point Absolute prevention of short-circuit accidents (DT4255)

In the event of erroneous operation, a protective circuit functions to prevent a short-circuit. A current-limiting resistor limits the short-circuit current if damage to the tester's circuitry results in a short-circuit condition, and a fast-blow fuse quickly disconnects the circuit to ensure safety.

Data Creation Software for Populated Board Testing

FIT-LINE INSPECTION DATA CREATION SYSTEM UA1780

The UA1780 generates data from Gerber data and mounting data while referencing component library information

- No need for camera-based teaching
- No need to visually trace patterns under components
- Easy generation of high-quality test data without boards
- Support for the new FA1240 data format

Thanks to these features, programs can be created with plenty of time to spare before the prototyping stage. Anybody can generate high-quality test programs in a short period of time by using net information that has been reverse-generated from Gerber data and component information libraries. The UA1780 delivers maximum performance when used in conjunction with Hioki's new FA1240-60 flying probe tester.

- Data from the legacy 1101 and 1102 cannot be converted for use by the 1220 (FA1220) because Hioki is unable to supply computers that can run the 1137 Support Software.
- Data compatibility between the FA1220/FA1221 and legacy products (1220-00/-01/-02/-11/-50/-51/-52/-55): Although data created for legacy products can be used, such data is not fully compatible with the FA1220/FA1221. It may be necessary to perform stray capacitance acquisition, wiring resistance acquisition, S/O data acquisition, IC data acquisition, and component test debugging. In particular, it may be necessary to reacquire stray capacitance in applications that involve measurement of minuscule capacitance values.

Product Warranties

Hioki products are generally covered by a three-year warranty.

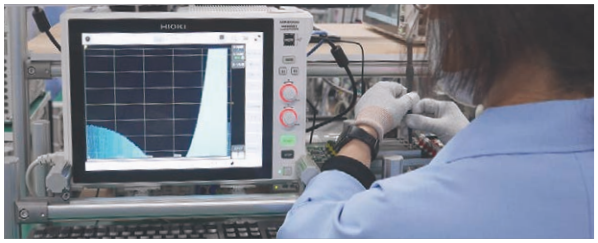

Product warranty	In the event Hioki is responsible for the failure of a product during the warranty term beginning on the date of purchase (or beginning in the month the product was manufactured if the date of purchase is unclear), we will repair or replace the product free of charge.
Warranty scope	We check products on a standalone basis to verify their specifications, performance, and functionality. Although we verify proper operation of components that are connected to Hioki products in standard configurations, we ask that customers verify proper operation of their Hioki products when connected to other manufacturers' products. The scope of Hioki's warranty is limited to Hioki products. Connected devices and issues caused by connected devices are considered outside the scope of the warranty. In the event of physical damage, any compensation that might be provided by Hioki is limited to the purchase price of the product.
Accuracy guarantee	For products with an accuracy guarantee, we guarantee the level of accuracy indicated in the specifications for a certain period of time following shipment from the factory. In the event of an accuracy defect during that period of time, we will adjust the product free of charge.

After-sales Service

Standard Calibration	If measured values fail to meet Hioki's standards during a calibration performed by Hioki ("Standard Calibration"), the instrument will be adjusted to meet the standards, and the calibration will then be repeated. For supported products, please refer to the "Service Information by Product" section on our website. Except for certain products, the company recommends that each product's accuracy guarantee period be treated as the recommended calibration interval. If a customer reports a loss of acurracy after Standard Calibration while the instrument in question is coverd by the recommended calibration interval and we are able to verify the issue. , we will adjust the instrument free of charge.
ISO/IEC 17025 Calibration (JCSS)	After Standard Calibration, we perform calibration based on ISO/IEC 17025. Hioki Headquarters is an international MRA-compliant, JCSS-accredited calibration service provider that meets ISO/IEC 17025 requirements. A JCSS calibration certificate bearing the JCSS symbol, compliant with the international MRA framework, is issued as internationally recognized proof of calibration. For details about which products are eligible for this service, please contact us. Note that the service is limited to the JCSS-accredited field of calibration. You can check the JCSS-accredited field of calibration on our website under Service for Calibration and Adjustment > ISO/IEC 17025 Calibration (JCSS) > JCSS certificate and scope of accreditation(English).
Repair	All faults reported by the customer will be repaired. Standard calibration is first conducted as a pre-repair diagnostic procedure, followed by standard calibration or adjustment/calibration after the repair. In some cases, pre-repair calibration may not be possible depending on the type of repair required. For supported products, please refer to the "Service Information by Product" section on our website. If within six months of the original repair, Hioki is responsible for an issue requiring an additional repair (a repair of the same issue) of a product that has been used as described in its user manual. We will repair it free of charge.

Warranty coverage after each service does not apply to issues suspected to be caused by factors such as component lifespan and degradation, equipment damage, or problems related to usage or storage conditions.
The calibration validity period (calibration interval) should be determined by each customer, taking into account the calibration interval recommended by the company.

Quality of Hioki's calibration and repair service

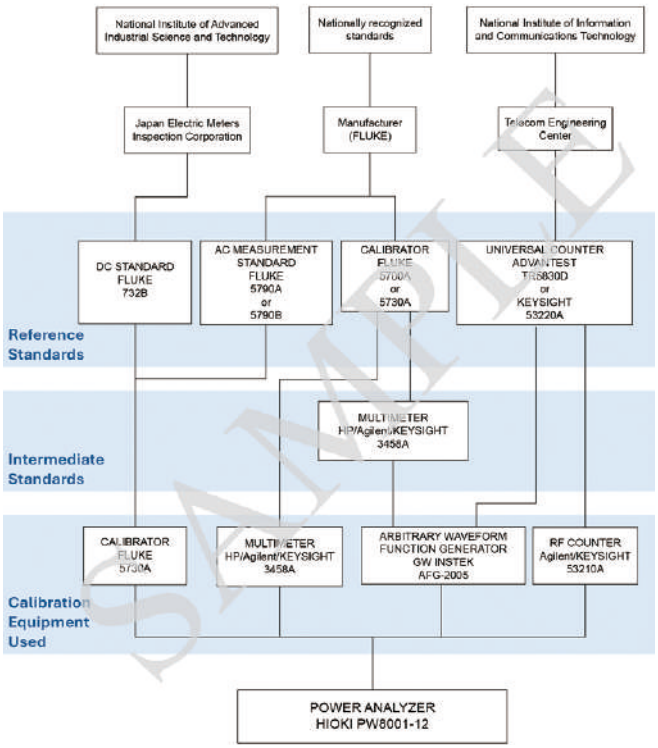

90 years of history and fine-grained, expert service
Technicians performing calibration, adjustment, and repair work undergo in-house training to ensure they possess the specialized expertise and skills that such work demands.

Precise calibration and adjustment guidelines compiled by product designers
We determine everything from the procedures for measuring instrument functionality checks to calibration points based on the results of reviews conducted by designers who are well versed in the characteristics of products' internal circuitry and the principles that underlie their operation. In this way, we are able to provide optimal, extensive calibration and adjustment service as only the manufacturer can.

Highly reliable service that's traceable to national standards
The standard devices we use to calibrate and adjust products are all linked to national standards, ensuring that we can issue inspection reports with accurate, reliable calibrated values.

Comprehensive calibration and repair service with fast turnaround
If we discover a malfunction or failure during the calibration process, we'll contact you to let you know where the problem is and what's necessary to address it. If you wish, we'll then repair the product. This capability eliminates unnecessary back-and-forth so you can put your product back to work as soon as possible.

Calibration and Repair Service

(1) Service content

Calibration Services

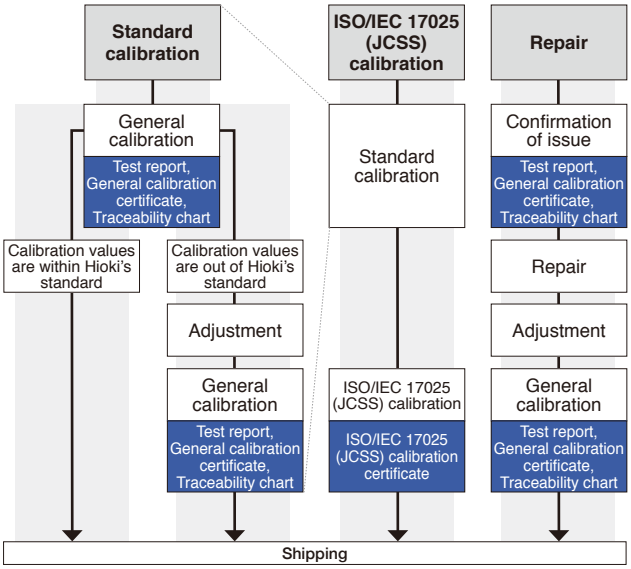

When an instrument is calibrated and its measured values are found not to satisfy internal Hioki standards, the instrument is adjusted. Through the ongoing use of calibration services offered as only an instrument manufacturer can, customers are able to use their instruments with peace of mind while maintaining their precision.

This calibration service will allow us to return products to customers with minimal downtime, since there are no work interruptions.

Notes

*If you do not wish your instrument to be adjusted, please let us know when you request calibration. Your product will be returned without adjustment, even if the calibration report indicates a FAIL judgment (non-compliance).

*This service does not extend to products that cannot be adjusted or to discontinued products.

Depending on the type of repair, standard calibration may not be possible in advance.

Calibration

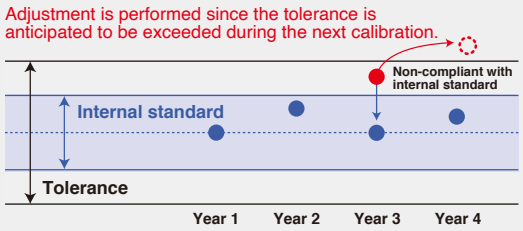

Calibration provides a way to check the condition of a measuring instrument by comparing the ideal value indicated by a standard device with the value indicated by the instrument being calibrated.

Adjustment

Calibration values will be optimized so that the instrument satisfies Hioki's internal standards.

If an instrument is adjusted as part of calibration service

Values are optimized so that they satisfy Hioki's internal standards to reduce the risk that they will subsequently exceed the tolerance.

ISO/IEC 17025 Calibration (JCSS)

When is JCSS necessary?

JCSS calibration is the solution when you need calibration that includes inaccuracy data, for example ISO/IEC 17025 calibration, ILAC calibration, MRA calibration, or IATF 16949 calibration.

Specific examples:

Calibration of instruments used by automobile (or motorcycle) manufacturers and part suppliers

Calibration of instruments used in UL product certification

Calibration of instruments as required by Japanese law (for radiation therapy) or ministerial ordinance (for pharmaceuticals and quasi-drugs)

JCSS calibration and international MRAs

JCSS is a registration program designed to ensure that calibration service providers possess the technological skills needed to perform calibration that complies with measurement-related laws and the requirements imposed by ISO/IEC 17025.

Registered service providers are entitled to perform JCSS calibration and issue calibration certificates bearing the JCSS symbol mark. Such certificates serve as evidence of the calibration service provider's technological skills and traceability. JCSS calibration service providers who have been certified as international MRA-compliant can issue calibration certificates bearing the ILAC-MRA and IA Japan symbol marks. Such certificates can be used as official documents whose validity is recognized worldwide.

International MRAs

An MRA is a mutual recognition agreement. IA Japan belongs to ILAC and APAC which includes NVLAP, A2LA, UKAS, DAkkS, and NATA. Calibration certificates issued by calibration service providers that have been certified as MRA-compliant by IA Japan are treated as equivalent to calibration certificates recognized by member certification entities in member countries.
