

**Heart Rhythm Center
Featuring a Medical Device/Pacemaker Clinic
Helping you keep pace with life**

Open Monday - Friday 8:00 am - 4:00 pm

Unlike other muscles in the body which take direction from the brain, the heart runs on autopilot. Electrical signals keep the heart contracting in a specific rhythm that keeps the blood flowing at the right pace and in the right direction. If the electrical signals are not properly synchronized, they can cause problems.

A device, such as a pacemaker or implantable cardiac defibrillator (ICD), can be implanted to help your heart keep its rhythm. Ongoing monitoring is an essential component in the care of patients with a pacemaker or a defibrillator.

Our medical device clinic adds convenience to these multi-annual device checks. During the clinic, patients work with our skilled technicians, as well as representatives from the top device companies, to assure they are monitored for any signs of device replacement, patient initiated reprogramming and signs of malfunction. Our goal is to provide the patient with the most current management techniques while insuring safe, compassionate care.
