

## How is Keelcrab effective?

Keelcrab is effective in performing remote-controlled cleaning, maintenance, and hull inspection activities for boats. It is designed with a plastic exoskeleton that ensures neutral hydrostatic buoyancy and maintains perfect adherence to the hull. The robot generates a powerful suction effect using a marinized pump motor. Certified nylon and stainless Brushes help in removing algae or vegetation or the first layer of incrustation on all kinds of all materials, that typically form on the boat's hull during docking in closed waters. This innovative solution aims to reduce maintenance costs related to yearly hauling and re-painting and reduce the need for medium-term extraordinary interventions.
