

ESSAY ON CLIMATE CHANGE

(BY ENIOLA OJO)

Climate change refers to a long term shift in temperature and weather patterns. This shift may be natural or artificial. This changes has become a concern for the last few years.

SOME OF THE EFFECT OF CLIMATE CHANGE

- (1) It causes terrible storms
- (2) Hotter temperature
- (3) Destroys places where humans and animals live
- (4) Rising sea levels
- (5) Melting Glaciers and warming oceans etc.

WHAT CAUSES CLIMATE CHANGE

1. Generating power: Most electricity is produced from fossil fuels which can cause a large chunk of global emissions. Only about a quarter comes from wind, solar and other renewable sources.
2. Cutting down Forest: when trees are cut down in the forest, they release the carbon that have been stored in them over the years into one atmosphere thus polluting it. Destroying trees challenges nature's ability to keep emissions out of the atmosphere.
3. Generating power: Generating electricity and heat by burning fossil fuels such as coal, oil and natural gas causes a large chunk of global emission.

How to avoid climate change

Change your home's source of energy, consider your travel, clean up your environment and switch to an electric vehicle etc. It is very important to take climate change serious.
