Preparations for a bed bug treatment.

First thing to keep in mind when preparing for a bed bug treatment is that the more well prepared you are for the treatment the better job we can do. Please follow this prep sheet closely so we can solve this problem quickly and efficiently.

Prior to treatment

- Remove all bedding from all beds in the home and run through a drier on high heat for at least 30 minutes.
- Remove all cloth curtain window coverings and run through a drier on high heat
- Remove all items from inside and on top of nightstands, dressers and end tables.
- Removed all items from the closets, dressers, nightstands and end tables, any cloth items in these areas need to run through a drier on high heat, other items in these areas can be bagged and placed elsewhere
- Removed items from under the bed and on the floor.
- Removed all extra blankets and pillows and run through a drier on high heat for 30 minutes.
- Remove clutter from baseboards throughout entire house. It is essential that we are able to treat all baseboards throughout entire home.
- Take a vacuum cleaner and try to suck any active bedbugs up from cracks and crevasse in couches, recliners, and mattresses/box springs.
- Bags of non-cloth items can be placed outside, inside the garage, bathtub, kitchen table, or in the center of the kitchen.
- If you have questions about preparing for this treatment, please contact us.

After treatment

- If treatment is still wet, please vacate the house until treatment is fully dry to the touch. Sometimes running a fan will speed this process up.
- Do not clean baseboards, bedframes, or door trims for as long as possible. If residue is visible, you may clean these areas with a damp cloth.
- We do recommend you continue to sleep in the home or affected area to draw bedbug out that may not have been treated during initial treatment.
