EXERCISE 13A PAGE 288

$$1 \text{ Assume } \exists m, n \in \mathbb{Z} \text{ s.t. } 28m + 21n = 1.$$

$$\text{Then } 4m + 3n = \frac{1}{7}.$$

$$\text{But } m, n \in \mathbb{Z} \Rightarrow 4m + 3n \in \mathbb{Z}, \text{ and } \frac{1}{7} \notin \mathbb{Z}.$$

This contradicts our assumption that $m, n \in \mathbb{Z}$, and proves that there exist no integers m and n such that $28m + 21n = 1$.

$$2 \mathbf{a} \text{ Assume } \exists m, n \in \mathbb{Z} \text{ s.t. } 27a + 36b = 1.$$

$$\text{Then } 3a + 4b = \frac{1}{9}.$$

$$\text{But } a, b \in \mathbb{Z} \Rightarrow 3a + 4b \in \mathbb{Z}, \text{ and } \frac{1}{9} \notin \mathbb{Z}.$$

This contradicts our assumption that $a, b \in \mathbb{Z}$, and proves that there exist no integers a and b such that $27a + 36b = 1$.

b e.g. $x = 7, y = -5$

3 Assume $ab \in \mathbb{Q}$, i.e. $ab = \frac{m}{n}, m, n \in \mathbb{Z}$.

Also, $b = \frac{c}{d}$ as $b \in \mathbb{Q}$.

Then $a \frac{c}{d} = \frac{m}{n}$

$$a = \frac{dm}{cn} \Rightarrow a \in \mathbb{Q} \text{ as } dm, cn \in \mathbb{Z}.$$

This contradicts the statement that a is irrational. Therefore the original statement that the product ab is **irrational** must be true.

4 Assume that n is odd, i.e. $n = 2m + 1$.

$$\begin{aligned} \text{Then } n^2 &= (2m+1)^2 = 4m^2 + 4m + 1 \\ &= 2(2m^2 + 2m) + 1 \end{aligned}$$

which is odd.

This contradicts the statement that n^2 is even. Therefore the original statement that if n^2 is even n must also be even must be true.

5 Assume that $\sqrt{2}$ is rational, i.e. $\sqrt{2} = \frac{a}{b}$,

$a, b \in \mathbb{Z}$, and that this fraction is written in its simplest terms.

$$\text{Then } 2 = \frac{a^2}{b^2} \Rightarrow 2b^2 = a^2 \text{ i.e. } a^2 \text{ is even.}$$

If a^2 is even then a must also be even, i.e. $a = 2c, c \in \mathbb{Z}$.

Then $a^2 = 4c^2, 2b^2 = 4c^2, b^2 = 2c^2$ i.e. b^2 is even, and therefore b is also even.

But this contradicts the assumption that $\frac{a}{b}$ was a fraction written in its simplest terms.

Therefore the original statement that $\sqrt{2}$ is irrational is true.

6 Assume there does exist a greatest even number $2n$. Now consider $2n + 2$.

$2n + 2 > 2n$ and also $2n + 2 = 2(n + 1)$ so it is also even. This contradicts our assumption that $2n$ was the greatest even number, and we have therefore proved that there is no greatest even number.

7 Assume that there does exist a greatest odd number $2n + 1$. Now consider $2n + 3$.

$2n + 3 > 2n + 1$ and also $2n + 3 = 2(n + 1) + 1$ so it is also odd. This contradicts our assumption that $2n + 1$ was the greatest odd number, and proves that there is no greatest odd number.

8 Assume that there does exist a greatest rational number $q = \frac{a}{b}, a, b \in \mathbb{Z}$.

$$\text{Now consider } q + 1 = \frac{a}{b} + 1 = \frac{a+b}{b}.$$

$$a, b \in \mathbb{Z} \Rightarrow a + b \in \mathbb{Z}. \therefore \frac{a+b}{b} \in \mathbb{Q} \text{ and}$$

$$\frac{a+b}{b} > q. \text{ This contradicts the assumption}$$

that q was the greatest rational number, and proves that there is no greatest rational number.

9 Assume that there does exist a smallest positive rational number $q = \frac{a}{b}, a + b \in \mathbb{Z}^+$.

$$\text{Now consider } \frac{a}{b+1}, b \in \mathbb{Z}^+ \Rightarrow b+1 \in \mathbb{Z}^+,$$

$$\text{so } \frac{a}{b+1} \in \mathbb{Q}^+, \text{ and } \frac{a}{b+1} < \frac{a}{b}.$$

This contradicts the assumption that q was the smallest positive rational number, and proves that there is no smallest positive rational number.

10 Let a^2 and b^2 be odd, and assume that

$$a^2 + b^2 = c^2 \text{ for some } c \in \mathbb{Z}.$$

Now a^2, b^2 odd $\Rightarrow a, b$ also odd

$$\text{i.e. } a = 2m + 1 \quad \text{and} \quad b = 2n + 1$$

$$a^2 = 4m^2 + 4m + 1 \quad b^2 = 4n^2 + 4n + 1$$

$$\text{Then } a^2 + b^2 = 4m^2 + 4m + 1 + 4n^2 + 4n + 1$$

$$= 2(2m^2 + 2m + 2n^2 + 2n + 1)$$

$$= c^2, \text{ so } c^2 \text{ is even.}$$

Now, if c^2 is even then c must also be even, i.e. $c = 2k$ and $c^2 = 4k^2$, so c^2 is in fact a multiple of 4.

$$\text{But } c^2 = 4m^2 + 4m + 4n^2 + 4n + 2$$

$$= 4(m^2 + m + n^2 + n) + 2$$

which is **not** a multiple of 4.

This contradiction proves that the original statement that the sum of any two odd square numbers cannot itself be a square number must be true.

11 Let $x, y \in \mathbb{Z}^+$. Then $x + y \geq 0$ and $2\sqrt{xy} \geq 0$.

Now assume $x + y < 2\sqrt{xy}$. Since both sides of the inequality are positive, we can square each side to get

$$(x+y)^2 < 4xy$$

$$x^2 + 2xy + y^2 < 4xy$$

$$x^2 - 2xy + y^2 < 0$$

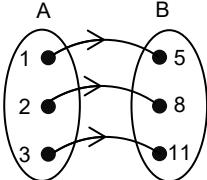

$$(x-y)^2 < 0$$

But no square can be negative.

This contradiction shows that

$$x + y \geq 2\sqrt{xy} \quad \forall x, y \in \mathbb{Z}^+$$
