

APEXBG+

APEX BG+ combines proven 45S5 bioactive ceramic with the known osteoinductive properties of demineralized human allograft bone.

- Forms a strong interfacial bond between the graft and adjacent bony tissue within minutes¹.
- Triggers the mechanisms that cause differentiation and proliferation of osteoblasts².
- Accelerates the process of Osteogenesis⁴.

By combining nanostructured bioactive glass with DBM compatibility, **APEX BG+** represents a shift toward intelligent regenerative materials engineered for early surface activation and predictable performance.
