| 1. Addition of oxygen | 1. Removal of oxygen |
| 2. Removal of hydrogen | 2. Addition of hydrogen |
| 3. Addition of an electronegative <br> element | 3. Removal of an electronegative <br> element |
| 4. Removal of an electropositive <br> element | 4. Addition of an electropositive <br> element |
| 5. Loss of electron | 5. Gain of electron |

Oxidation number denotes theoxidation state of an element in a compound ascertained according to a setof rules formulated on the basis thatelectron in a covalent bond belongsentirely to more electronegative element.

Calculation of oxidation number-

1. O. S. of all the elements in their elemental form (in standard state) is taken as zero O. S. of elements in $\mathrm{Cl}_{2}, \mathrm{~F}_{2}, \mathrm{O}_{2}, \mathrm{P}_{4}, \mathrm{O}_{3}, \mathrm{Fe}(\mathrm{s}), \mathrm{H}_{2}, \mathrm{~N}_{2}, \mathrm{C}$ (graphite) is zero.
2. Common O. S. of elements of group one $\left(1^{\text {st }}\right)$ is one. Common O. S. of elements of group two $\left(2^{\text {nd }}\right)$ is two.
3. For ions composed of only one atom, theoxidation number is equal to the chargeon the ion.
4. The oxidation number of oxygen in most compounds is -2 . While in peroxides (e.g., $\mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{Na}_{2} \mathrm{O}_{2}$ ), eachoxygen atom is assigned an oxidationnumber of -1 , in superoxides (e.g., $\mathrm{KO}_{2}, \mathrm{RbO}_{2}$ ) each oxygen atom is assigned anoxidation number of $-(1 / 2)$.
5. In oxygendifluoride $\left(\mathrm{OF}_{2}\right)$ and dioxygendifluoride $\left(\mathrm{O}_{2} \mathrm{~F}_{2}\right)$, the oxygen is assignedan oxidation number of +2 and +1 ,respectively.
6. The oxidation number of hydrogen is +1 but in metal hydride its oxidation no. is-1.
7. In all its compounds, fluorine has anoxidation number of -1 .
8. The algebraic sum of the oxidation numberof all the atoms in a compound must bezero.
9. In polyatomic ion, the algebraic sumof all the oxidation numbers of atoms ofthe ion must equal the charge on the ion.
Stocknotation:the oxidationnumber is expressed by putting a Romannumeral representing the oxidation numberin parenthesis after the symbol of the metal inthe molecular formula. Thus aurous chlorideand auric chloride are written as $\mathrm{Au}(\mathrm{I}) \mathrm{Cl}$ and $\mathrm{Au}(\mathrm{III}) \mathrm{Cl}_{3}$. Similarly, stannous chloride andstannic chloride are written as $\mathrm{Sn}(\mathrm{II}) \mathrm{Cl}_{2}$ and $^{\mathrm{Sn}(\mathrm{IV}) \mathrm{Cl}_{4} \text {. }}$

Oxidation: An increase in the oxidationnumber
Reduction: A decrease in the oxidationnumber

Oxidising agent: A reagent which canincrease the oxidation number of an elementin a given substance. These reagents are calledas oxidants also.
Reducing agent: A reagent which lowers the oxidation number of an element in a givensubstance. These reagents are also called asreductants.
Redox reactions: Reactions which involvechange in oxidation number of the interactingspecies

## Balancing of redox reactions:

## Oxidation Number Method:

Write the net ionic equation for the reaction of potassium dichromate(VI), $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ with sodium sulphite, Na 2 SO 3 , in an acid solution to give chromium(III) ion and the sulphate ion.
Step 1: The skeletal ionic equation is:

$$
\left.\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-} \mathrm{aq}\right)+\mathrm{SO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq})
$$

Step 2: Assign oxidation numbers forCr and S

$$
+6-2+4-2+3+6-2
$$

$$
\left.\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-} \mathrm{aq}\right)+\mathrm{SO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq})
$$

Step 3: Calculate the increase anddecrease of oxidation number, and make them equal:

$$
\begin{aligned}
& +6-2 \\
& \left.\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-( } \mathrm{aq}\right)+4-2 \mathrm{SO}_{3}^{2-}(\mathrm{aq}) \xrightarrow{+3} 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3{ }^{-6} \mathrm{SO}_{4}^{2-}(\mathrm{aq})
\end{aligned}
$$

Step 4: Balance the charge by adding $\mathrm{H}^{+}$as the reaction occurs in theacidic medium,

$$
\left.\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-} \mathrm{aq}\right)+3 \mathrm{SO}_{3}^{2-}(\mathrm{aq}) 8 \mathrm{H}^{+} \rightarrow 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{SO}_{4}^{2-}(\mathrm{aq})
$$

Step 5: Balance the oxygen atom by adding water molecule.

$$
\left.\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-} \mathrm{aq}\right)+3 \mathrm{SO}_{3}^{2-}(\mathrm{aq}) 8 \mathrm{H}^{+} \rightarrow 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{SO}_{4}^{2-}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

## Half Reaction Method

balance the equation showing the oxidation of $\mathrm{Fe}^{2+}$ ions to $\mathrm{Fe}^{3+}$ ions by dichromate ions $\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)^{2-}$ in acidic medium, wherein, $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ ions are reduced to $\mathrm{Cr}^{3+}$ ions.
Step 1: Produce unbalanced equation for thereaction in ionic form :

$$
\left.\mathrm{Fe}^{2+( } \mathrm{aq}\right)+\mathrm{Cr}_{2} \mathrm{O}_{7}
$$

Step 4: For reactions occurring in acidicmedium, add $\mathrm{H}_{2} \mathrm{O}$ to balance O atoms and $\mathrm{H}^{+}$to balance H atoms. $\left.\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+14 \mathrm{H}^{+} \rightarrow \mathrm{Cr}^{3+( } \mathrm{aq}\right)+7 \mathrm{H}^{2} \mathrm{O}$ (1)
Step 5: Add electrons to one side of the halfreaction to balance the charges. If need be, make the number of electrons equal in the twohalf reactions by multiplying one or both halfreactions by appropriate coefficients.
$\mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{e}-$
$\left.\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+14 \mathrm{H}^{+}(\mathrm{aq})+6 \mathrm{e}-\rightarrow 2 \mathrm{Cr}^{3+( } \mathrm{aq}\right)+7 \mathrm{H}_{2} \mathrm{O}$ (1)
$6 \mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow 6 \mathrm{Fe}^{3+}(\mathrm{aq})+6 \mathrm{e}-$
Step 6: We add the two half reactions toachieve the overall reaction and cancel theelectrons on each side. This gives the net ionicequation as :
$6 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+14 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 6 \mathrm{Fe}^{3+}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
A redox couple is defined as havingtogether the oxidised and reduced forms of asubstance taking part in an oxidation orreduction half reaction.
Represented as $\mathrm{Zn}^{2+/} \mathrm{Zn}$ and $\mathrm{Cu}^{2+} / \mathrm{Cu}$.

* Electrochemical cells are the devices which are used to get electric current by using chemical reaction.

Daniell cell having electrodes of zinc and copper dipping in the solutions of their respective salts.
The potential associated with eachelectrode is known as electrode potential. Ifthe concentration of each species taking partin the electrode reaction is unity (if any gasappears in the electrode reaction, it is confinedto 1 atmospheric pressure) and further thereaction is carried out at 298 K , then thepotential of each electrode is said to be theStandard Electrode Potential.

- SHE is used to measure electrode potential and its standard electrode potential is taken as 0.00 V .

Reduction \(\mathrm{O}_{2}+4 \mathrm{H}^{+} 4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}\)
\(\mathrm{e}-+1 / 2 \mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{Fe}^{2+} \rightarrow \mathrm{Fe}_{2} \mathrm{O}_{3}+4 \mathrm{H}^{+}\)
```
