

Hello parent or guardian,

Your child received Silver Diamine Fluoride on one or more teeth today. This is a safe, non-invasive treatment for small, early cavities that can stop & potentially reverse the decay process and restore the tooth to health without needing a filling. Results may vary from person to person but, it can make the tooth dark in color which is why we only place this on baby teeth, in the back of the mouth. We usually place a sealant material over the tooth as well for extra protection. No special after care is required.
