

Ednie Flower Bulbs presents...

Callas 2022

Flower Bulb Catalog

Ednie Flower Bulbs

Callas

for Cut Flower and Pot Plant Production

Ednie Flower Bulbs

Introduction

The Callas listed in this catalog are all produced and grown in The Netherlands from fresh tissue culture to ensure healthy tubers.

Prior to shipping, all tubers are treated with Gibberellic Acid for enhanced flowering.

All tubers have had various temperature treatments to shorten the forcing period.

Advantages

Following the recommended guidelines will give these benefits:

- Faster rooting and production
- Stronger stems
- Larger flowers
- Minimal waste

Callas are harvested once a year and we ship them out weekly. The new crop arrives in February.

2022 Calla Growing Schedule

will be available prior to shipping the new crop.

For more detailed information: See our Step-by-Step Growing Schedule. Our 2021 Growing Schedule for Callas 2021 is pictured on the left.

One of the characteristics of our tuber selection is that they have many eyes, ensuring a full plant with many flowers.

Number of Tubers per Pot

Size Tuber	4" Pot 10 cm.	6" Pot 15 cm.	8" Pot 20 cm.	10" Pot 25 cm.
14 - 16 cm.	1	2	3	5

1 tuber size 24/up cm.
or
3 tubers size 18-20 cm.

4.7-inch (12 cm.) pot
1 tuber size 14-16

~ 3 ~
Grown in The Netherlands

General Information

Callas can be grown year-round. It is important to understand that plants react differently in darker winter months than in warm, bright, summer months.

New crops (starting February 15th) will take longer than later plantings.

POT SIZES: S - M - L

Other Helpful Tips

- When tubers arrive, open the boxes or crates immediately so the tubers get fresh air. Do not store the tubers in closed coolers; always leave the door open a little for fresh air. Let the tubers sit for a few days (out of the sun) at 45 to 65°F. (8 to 18°C.).
- If possible, start the planted tubers in warmer temperatures.
- Watering should be kept to a minimum until the leaves unfurl.
- Soil should be sterile and well-drained with a pH between 6.0 and 6.5.
- After the leaves have completely unfurled, the plants need a lot more water to fully develop and produce optimum number of flowers.
- Light is very important to achieve as many flowers as possible.

Callas for Pot Production

- If possible, place pots with planted tubers in a warm and moist environment (72°F. or 22°C.) until all sprouts have developed.
- Once all sprouts have developed, containers can be placed in a cooler environment or outside as long as the temperatures do not dip below 45°F. (7°C.).
- When grown outside, protect from possible unexpected late frost by covering plants. If frost occurs, mist foliage with water early in the morning.

Callas for Cut Production

Callas for cut production can be grown in different ways:

- In ground beds in the greenhouse.
- In ground beds outside when soil temperature is at least 55°F. (13°C.).
- In plastic crates, inside or outside. They can be started inside and moved as long as the temperature does not dip below 45°F. (7°C.).

If possible, place planted tubers in a warm and moist environment at 72°F. (22°C.) until all sprouts have emerged. Then the crates can be moved to a cooler area.

*Callas in
Ground Beds*

*Callas in
Bulb Crates*

*Callas in Gerbera
or Trough System*

- In Gerbera /trough (similar to strawberries) system (see illustration).

Signs of stress by
Callas
is when foliage has
same color as flowers.

Number Tubers Planting

Size Tuber	/ Crate	/ Square Yard
14 - 16 cm.	7 - 8	18
16 - 18 cm.	6 - 7	16
18 - 20 cm.	5 - 6	14
20 - 22 cm.	4 - 5	12
24 / up cm.	3 - 4	10

Diseases

There are two diseases which can affect Callas:

- **PYTHIUM** - can be seen when roots look glassy instead of white. This is caused by an environment which is too wet. Avoid overwatering at all costs, especially at the beginning of the crop.

It can be treated with fungicides such as Agrimycin or Ridomil Gold. Always follow instructions on label.

- **ERWINIA** - is the most common disease in Callas. Remember... It is a secondary disease and almost always occurs when the plant is under stress which can be from overwatering or poor drainage.

The best recommendation is to carefully remove the diseased (collapsed) plants. It is a bacterial disease and can spread to its neighbor by careless handling of the diseased plants.

Clean hands, tools etc. with a disinfectant!

Other Helpful Tips for Cut Production

- Because tubers produce heavy stalks with (sometimes) many leaves, it is essential that plants receive enough light to form flowers. If tubers are planted too closely, flower production will be decreased. See chart on left for tuber spacing.
- Proper crate depth is important. Tubers should be covered with 2" (5 cm.) of soil. This is needed because roots form on top of the tuber and then move down. There should be at least 2" soil (preferably more) below the tuber because Callas produce many strong roots.
- When plants are growing, do not place crates on benches as the soil may get too warm.
- In warmer areas outside, it is helpful to cover the soil with either straw or other material to keep soil as cool as possible.
- Light is very important to achieve as many flowers as possible. However, for stem length, some shading may be needed, especially in the warmer months.
- To maintain healthy roots, grower should always check them. Preventing disease is always easier!
- When harvesting, do not cut flowers, rather PULL THE STEMS to avoid damaging the tuber and cause disease.
- Some leaves can be pulled to use for fillers in bouquets.
- Because of the longevity of the flowers, harvesting does not need to be done daily.
- Freshen water often in the pails with flowers but do not fill the pail, just a few inches is best. Cut the stems with a sharp knife at a 45° angle. Repeat each time when the water is refreshed.
- To prevent slimy stems, add a little disinfectant (such as peroxide) to the water.

For Cut Flower Production

This collection consists of

5 tubers each of the following 7 colors

RED	WHITE
YELLOW	PURPLE
PINK	SURPRISE...
ORANGE	35 tubers in total

All tubers are size 20-22 cm.

The varieties will be named but will vary per season or holiday like Easter. Mother's Day, Summer & Fall.

Cut flower Callas can be succession planted every four weeks. First plants will start to bloom 8 weeks after planting.

If well-watered, Callas will produce flowers for at least 4 weeks.

Each tuber will produce 5 - 8 flowers.

Grown in The Netherlands

*Enjoyed the Catalog?
More following soon...*

Schedule Your Calla Orders Early...

Since Callas can be grown Year-Round,
inventory dwindles fast.

*Therefore, booking your orders for an
entire year is a MUST in order to procure the
varieties you prefer.*

We aim to please everyone, but
"First come - First served"
is only fair to EVERYONE!
