Bare Root Peonies

E.F.B.

From the Ednie Team

We are pleased to present to you our Fall 2025 - Spring 2026 Peony Catalog. As you peruse this Catalog, you will notice that we have tried to give as much information as possible, similar to our other catalogs.

Compiling this catalog was a huge challenge as industry-wide everything is not "cut and dried" as in other categories of Flower Bulbs or Perennials. A possible explanation is that many Peonies are like chameleons; they can change color or shape as the flowers mature. Hence, there could be an argument that one variety belongs in the "Double", the "Semi-Double", or even a "Single" group when the flower opens and unfolds completely. Especially for wedding arrangements, the user will want to know if the flower will be completely white, even when it starts as blush pink.

With the help of our expert producers, we have tried to fit each variety within the group where (we think) they belong. As you can see, the catalog is divided into different groups with different sections within the group. But do not fret, we do have a complete alphabetical Index at the end of this catalog in case you are looking for a specific variety.

We thank you for your loyalty and past business and look forward to serving you even better.

If you have questions or need help with ordering or scheduling crops, please do not hesitate to contact us at our ordering department by either calling us at (973) 940-2700 or

Info@EdnieFlowerBulb.com

As with all the products we handle, we tried to help as much as possible with up-to-date growing information. You can always reach out to us at

GrowerSupport@EdnieFlowerBulb.com

We are always open for valid suggestions in order to improve our catalogs.

The Horticulture industry is always developing newer varieties, researching ways to enhance the growing environment and trialing natural and biological options to reduce chemical use and enhance "green" flower production.

Happy Growing!!

We became proud members of the American Peony Society which was established in 1903 because its founders wanted to standardize Peony names.

Their annual convention includes a free show and many opportunities to connect with other growers. It is also very educational as seminars are provided.

If you love Peonies, make sure you join the American Peony Society by going to their website. There are loads of benefits!

Peony or Paeonia

*Paeony is the genus name for Peonies and are members of the Paeoniaceae family.
They are native to Asia, Europe and Western North America*

Peonies are very versatile and make a gorgeous show of eye-catching colors whether in bunches, wedding bouquets, floral arrangements, potted plants or in landscapes. They are perennials which bloom in the spring to early summer depending on location. The foliage stays green all summer.

There are six groups based on their parental background. Each group has several sub groups. We have placed each variety into the correct group based on the information we have. We acknowledge the American Peony Society for their very helpful information. For more information please see their website.

Peonies can be divided into the following groups:

The characteristics of each sub group are summarized at the beginning of each section.

Hybrid

This group is the result of crossings any of the 45 recognized herbaceous species and has at least 2 species in its genetic background. Sub groups

DOUBLE pages 5 ~ 7

SEMI pages 8 ~ 10

SINGLE pages 12 ~ 13

Lactiflora

This group, also called Common Garden Peony, is the largest and has been in cultivation for centuries in China. Many varieties have been propagated for over 100 years and are listed as heirlooms. Many of these varieties have side buds which open after the primary bud thus extending blooming time. They can survive very cold winters. Sub groups

BOMB pages 14 ~ 15

DOUBLE pages 16 ~ 24

SEMI page 25

SINGLE pages 26 ~ 27

Itoh

(or Intersctionals). This group is a cross between a Laciflora (herbaceous) Peony and a Suffruticosa (Tree) Peony. They make an outstanding show in the garden and (with careful planning) for weddings. Sub groups are:

DOUBLE page 28 ~ 29

SEMI pages 30 ~ 32

SINGLE page 33

Species

We carry only a small selection.

page 34

Patio

Short varieties especially suited for smaller pots. page 35

Suffruticosa

(or Tree Peonies) These woody shrubs can grow up to 6 ft. tall when mature.

pages 41 ~ 43

Information

Explanations, Growing Instructions and Helpful Hints. pages 3, 4, 11, 12, 36-40, 44-46

Bare Root Peonies

Remember, it is very important
that the roots are planted
upon arrival.

Herbaceous Peony Roots

All Herbaceous Peonies come in 2 different sizes:
2-3 eyes
3-5 eyes

Minimum Quantities

Size 2-3 eyes 25

Size 3-5 eyes 20

Varieties over \$ 10.00 each 10

Shipping Months

We ship from the middle of October until May,
weather permitting

Tree Peony Roots (Suffruticosa)

All Tree Peonies come in 2 different sizes

No. 1 5 - 6 stalks per root
most popular size

No. 2 3 - 4 stalks per root

They are originally grown in China and then prepared
and treated for shipping in our Dutch warehouses.

Minimum Quantity

No. 1 Size 5

No. 2 Size 5

Shipping Months

We ship from late October until late December,
weather permitting.

Explanation of Column Headings

All Information listed below may vary by zone and/or weather circumstances

EFB Code	Helps us to identify the variety
Variety	Name of Cultivar
Description & Characteristics	Color description Additional plant/flower information
Plant Height	is listed in inches/centimeters. Please note that heights may vary in different parts of North America versus The Netherlands.
Flower Size	is listed in inches/centimeters. Please note that heights may vary in different parts of North America versus The Netherlands.
Blooming Time	Very Early, Early, Early to Mid, Mid, Mid to Late, Late, Very Late.
Cut / Pot	Indicates whether varieties are suitable for Cut Flower production or Pot Plant production or both.
Support Needed	Flowers may be too heavy for even strong stems, therefore either Yes, No, or Maybe, which depends on growing conditions which includes very windy areas.
Flower Fragrance	None, Light, Mild, Sweet, Pleasant, Poor.

Peony Pack

Herbaceous Roots	Per Crate

No. 1	5
No. 2	5

Hybrid Double Peonies

As stated on page 3, Hybrid Peonies are the result of crossings any of the 45 recognized herbaceous species.

This group is further divided into 3 sub groups:
Double, Semi-Double, and Single.

The next 3 pages list only the Hybrid Double varieties.
This sub group includes Hybrids that have multiple layers of petals with stamens that are hardly visible.

EFB Code	Hybrid DOUBLE Variety	Description & Plant Characteristics	Natural Height	Flower Size	Flower Time	Cut / Pot	Support Needed	Flower Fragrance
PE 1106	BELGRAVIA	Red flowers with hundreds of petals make a gorgeous show; does not fade. Strong stems.	36 in. 90 cm.	8 in. 20 cm.	Early	Cut	Yes	None
PE 1505	BLONDE VISION	This light yellow to cream variety has slightly curved petals neatly arranged; darker center. Strong stems.	36 in. 90 cm.	7 in. 18 cm.	Early to Mid	Cut	No	None
PE 1805	BLUSH QUEEN	This off-white Peony flower has a slight pink blush in the center.	40 in. 100 cm.	8 in. 20 cm.	Mid to Late	Cut	No	Light
PE 1311	CARNATION BOUQUET	A floriferous Peony with pleasant pink carnation like petals. Up to 30 stems per clump. Thin stems.	34 in. 85 cm.	5 in. 13 cm.	Early to Mid	Cut	Maybe	Light
PE 1111	CHRISTMAS VELVET	Blood red fully double flowers are upright on strong stems. Nice foliage.	34 in. 85 cm.	7 in. 18 cm.	Early	Cut	No	None

Peony Flower Anatomy

Outer Petals (Guard Petals) "present" or show off all the other petals. There may be as few as 5 up to 13 in cultivated varieties. Sometimes they are saucer-like and other times they are cup-shaped.

Carpels are in the very center of the flower and lead to pods bulging with seeds. They are separate but appear in clusters. Their outer surfaces can vary in color and also from velvety to a smooth skin.

Inner Petals are the most advanced petal form resulting from all-over stamen transformation. They are similar in color and narrower but can grow to substantial length and form a ball even as large sometimes as the guard or outer petals, characteristic of the bomb type..

Sepals are tough, green floral segments merged at base of flower. Not shown.

Stamens are the pollen bearing structures arising in a smaller group in the middle of the flower in contrast to the petals surrounding them.

Transformation of stamens leads to contrasts in form, color, or both and varies greatly by variety. These less than definable structures are staminodes, petalodes and inner petals.

Staminodes are the closest in form to the natural stamens and show natural pollen color. The first distinctive staminode form was first received from Japan and named "Japanese".

Stigma includes all the upper extension of the carpels.

Petalodes are of thinner texture and smaller than guard (outer) petals ranging in color from contrasting to same color as guard petals.

Diploid, Triploid, and Tetraploid

The ploidy level is based on the number of sets of chromosomes in a cell's nucleus.

Diploids are the most common form of sexual reproduction with two sets of chromosomes (male and female) They produce true to type with predictable outcomes.

Triploids are the least frequent seen, each cell having three sets of chromosomes (one male and two females) They are often sterile and cannot produce viable seeds.

Tetraploids where each cell having four sets of chromosomes (two males and two females) They have the most amount of sugars and are often larger in size and strength; most often lower pollen fertility.

Hybrid Single Peonies

This sub-group includes hybrids which have only one layer of petals. They open to boldly display the stamens.

America

Claire de Lune

Apricot Whisper

Claire de Lune

Flame

Golden Frolic

EFB Code	Hybrid SINGLE Variety	Description & Plant Characteristics	Natural Height	Flower Size	Flower Time	Cut / Pot	Support Needed	Flower Fragrance
PE 1100	AMERICA	Rich blood red flowers increase in size as they bloom and make an eye-catching display.	36 in. 90 cm.	7 in. 18 cm.	Early	Cut	No	Light
PE 1400	APRICOT WHISPER	The name says it all. The softest pastel apricot flower has a touch of pink at the heart of the petals.	28 in. 70 cm.	7 in. 18 cm.	Very Early	Pot and Cut	No	Mild
PE 1510	CLAIRE DE LUNE	Bright yellow buds open as cream and get lighter. Ideal for bouquets. Strong thin stems.	30 in. 75 cm.	6 in. 15 cm.	Very Early	Cut	No	Mild and Sweet
PE 1325	FLAME	Flowers are magenta pink. Floriferous. Long lasting as cut flowers.	30 in. 75 cm.	6 in. 15 cm.	Early	Pot and Cut	No	None
PE 1930	GOLDEN FROLIC	Baby pink large petals are burgundy towards the centers. Floriferous. Foliage is gold-colored.	24 in. 60 cm.	6 in. 15 cm.	Early	Pot and Cut	No	None

Floriferous versus Multiflowering

In our descriptions we use both terms.

Floriferous or **Prolific** bloomer means that the Peony plant produces many flowers, one flower per stem; these are ideal for cut flower customers and also for bouquets.

Multiflowering is when there is more than one flower on each stem (side buds). Many Lactiflora varieties are multiflowering.

Itoh Double Peonies

28

As stated on page 3, Itoh Peonies are a hybrid crossing of the traditional Herbaceous Peony and Peony Suffruticosa. Because of the genes in either group the result is a very strong plant with upright stems.

In many cases, they produce enormous flowers in combination with very attractive foliage which lasts the entire season.

This Double sub-group includes those varieties with many petals.

Bartzella

EFB Code	Itoh DOUBLE Variety	Description & Plant Characteristics	Natural Height	Flower Size	Flower Time	Cut / Pot	Support Needed	Flower Fragrance
PE 4205	BARTZELLA	Huge lemon yellow flowers make a stunning show. Many side buds; blooms for 3-4 weeks. Strong.	36 in. 90 cm.	8 in. 20 cm.	Mid	Pot	No	Pleasant Spicy
PE 4410	CANARY BRILLIANTS	Buds are very soft apricot orange which turn lighter when opening. Prefers northern sun.	32 in. 80 cm.	8 in. 20 cm.	Mid	Pot	No	Light
PE 4310	CAROLINE CONSTABEL	Petals of fully double peony are very light salmon pink, darker towards center. Dark green leaves.	36 in. 90 cm.	5 in. 13 cm.	Mid	Pot	No	Light
PE 4411	COPPER KETTLE	Blooms are coppery looking with some lighter and darker blotches. Dark green foliage.	34 in. 85 cm.	8 in. 20 cm.	Mid	Pot	No	Light

Quality, Service & Expertise

Herbaceous Peonies

Upon Arrival

Remember, it is very important that the roots are planted within 48 hours.

Herbaceous Peonies are longlasting perennials and very easy to grow. As seen in the descriptions, many varieties are heirlooms, meaning they are more than 100 years old. They grow in the spring, die in late fall and are dormant during the cold(er) winter. This provide a much needed rest period for flower setting.

Peonies are dug after receiving a natural rest period which starts when the temperatures drop. Therefore we cannot ship freshly-dug Peonies before the middle of October.

This prevents disturbing the plant cycle and quality is preserved to the utmost. Ideally, the ground should not be too cold when planting your new crop so that the fine hair roots can develop before winter sets in. Of course if the roots are planted in the early spring, no flowers can be expected in the first year.

See also page 39: *"Tips for Flower Production"*.

Planting: Soil

Soil should be well-drained; Peonies do not like "wet feet". This could cause the roots to rot and the plants may not survive. If you have a "wet" plot where you want to plant the Peonies, "hilling" (like potatoes) is suggested. Make sure that the planting area is not over-protected as far as wind is concerned. "Still" areas could cause fungal diseases or botrytis, especially in rainy years. Plenty of air circulation is very important.

Heavier types of soil slow down the process of flower production. However this does not have to be negative because they will produce for more years. Peonies can be grown in sandy soil but will need extra attention with water and fertilizer. Enriching the area to be planted by digging a hole 18" deep (45 cm.) and 15x15" (40x40 cm.) is recommended. Add well-composted cow manure to the bottom of the hole.

Fields with a pH of 6.5 - 7.5 are ideal. Raise the pH if the soil is below 6.5 by using extra calcium. Lower the pH if the soil is above 7.5 by using peat or similar substrates.

Sunlight is very important for optimum flower production. A full day of sunshine is ideal but half sun/half-shade will suffice. Because of this, do not plan your Peony bed too close to large bushes and/or big trees because they may hamper light and surface roots may "steal" water which is needed for Peonies to grow.

Remember, Peonies remain in the same place for many years.

Do not re-use an area where Peonies have been grown in the past as diseases can remain in the ground for many years and the soil may have become "tired" of Peonies like potatoes or other crops.

Planting: Depth

Plant depth is very important. The eyes of the root (generally the flowering eyes) need to be placed right under the surface of the soil. If planted too deep, the Peony will produce foliage but NO flowers. Generally, the plant will adjust but it slows down flowering by several years.

Plant depth does vary per horticulture zone. For warmer zones (7-8) the tip of the root should be 0.5" (1.25 cm.) under the surface of the soil. For mid zones (5-6) the tip should be 1" (2.5 cm.) under the surface of the soil. For colder zones (3-4) the tip should be about 2" (5 cm.) under the surface of the soil for optimum results.

Make sure soil is stamped down around and in between the roots to avoid air pockets. Check the Peonies after the first heavy rain to ensure that the tips of the roots are not showing. Possibly add some soil if needed.

Since Peony plants grow not only in height but also in width, plenty of space is needed. Depending on variety, most need an area of 2.5 - 3 ft. (0.75 - 1 mtr.) per plant especially for cut flower production.

For border planting in landscapes, 32 in. (80 cm.) distance will suffice.

Upon Arrival (continued)

Fertilizing

Peonies, especially those with good root systems, contain enough nourishment to grow. Too much fertilizer will cause lush plants with a lot of foliage but few or no flowers. Over-fertilizing causes plants to become soft and because of this susceptible to insect predators and diseases.

A general rule is to add only a handful of well-composted cow manure to each plant in the fall. If the crop (after flowering) looks pale, some NPK fertilizer (12-10-18) could be added.

Watering

When newly planted Peonies are establishing roots and there is an extended dry spell, watering in the evening is recommended. Only if there is a long period of drought it is advisable to water the crop. Peony roots grow down well after the first year; hence they can maintain themselves, except in drought conditions.

Once Peonies are established not much additional water is needed. Only during a long period of drought is it advisable to water the crop.

During a warm spell In Spring, plants may droop but it does not mean they need water. The plants transpire water faster than the roots can take up the water. In the evening the plants re-establish themselves again. The reason for this is that Peonies grow extremely fast in the spring and hence the plants are still somewhat soft. As they coming closer to flowering, they will harden and drooping will hardly happen anymore.

Weeds

It is strongly recommended to keep the area in and around the Peonies weed-free. Weeds can cause damage by taking nourishment, water and sunlight away. The greatest problem is that weeds can be host plants to many bad insect predators or diseases. A clean field results in low infected plants and looks much better as well.

Diseases

If healthy stock (free of nematodes and virus) is being used possible diseases are mostly kept to a minimum. We do our utmost to ship disease-free material.

When the Peony beds are well maintained diseases are hardly ever seen. The only culprit can be Botrytis which can appear in early Spring and cause plants to fall over as the stems are attacked at the soil level. Botrytis can also appear on the flower buds and show damage underneath the flower.

Botrytis can be spotted by leaves turning brown. Grey fluffy mold appears especially during or after a period of wet weather.

The best cure is prevention by removing the affected parts of the plants as early as possible with a sharp clean knife (use Hydrogen Peroxide to keep knife clean)(Sterilized) to prevent further fungal spreading.

This is also why plants should never be planted too close as there will be insufficient air circulation. Loosen the top surface of the soil as the plants show new growth.

Botrytis is mostly a "wet year/season" problem. The spores need a 85% Relative Humidity in order to thrive. The above preventive measures help eliminate most of the problems.

Mowing and Removing

To keep the Peony fields happy and as healthy as possible, it is strongly recommended mowing down the plants towards Fall (depending on your location) and to REMOVE all dead organic material (including the weeds) because all kind of diseases live in dead material.

Support

Each cultivar is different. As you can see in the "Support Needed" column by each variety, some need, some maybe, and some not this does depend on the area the Peonies are grown, for instance windy areas need it quicker to calm climates; high light areas versus lower light areas. However, during flowering (in landscape) the flowers may get top heavy during a rainy season. Sometimes prevention saves the day!

Peonies as Cut Flowers

Peonies make excellent cut flowers. Proper planning by planting early blooming varieties to later blooming varieties, the flower season is from early to late spring.

Our extensive variety list in this catalog includes flowers for an economy-priced bunch as well as specialty types with more unique flowers for the higher end florist. Some of these varieties can be used for wedding bouquets and centerpieces as well.

Many Peony cultivars have side buds. In order to get larger primary flowers it is suggested to remove some of the smaller buds. As with everything, there are pros and cons to removing the side buds. It is a matter of choice!

ADVANTAGES of NOT removing buds

- A. The flowering time of the stem is extended.
- B. The presentation is more graceful.

ADVANTAGES of removing buds

- A. Better for the forming of the plant.
- B. The stems bear less weight, hence less likely to bend over.
- C. The main flower becomes larger and maybe more useful for bouquets, wedding work, etc, where showy flowers are needed.
- D. Preferred presentation.

Disbudding Peonies

When the decision is made to remove the side buds, it is best to wait until the side buds are as large as peas.

TOO SOON will cause the elimination of its side leaves.

TOO LATE will cause unnecessary open wounds which becomes a source for bothrytis to attack.

METHOD:

Hold the main bud gently in the one hand between thumb and fingers while side bud is held by the other hand between thumb and index finger. Carefully pull the side bud down. By doing this, only the bud is removed from the leaf axil and the leaves remain intact.

38

Cutting Peonies

TOO
EARLY

JUST
RIGHT

TOO
LATE

Always cut flowers in early morning or near sunset. When cutting flowers always use a very sharp clean knife to keep the wound as clean as possible. Flowers should only be cut when the buds feel like marshmallows. Too early means the flowers do not open, see pictures. Leave a minimum of 2 leaves per stem for the main plant to survive another year; it is the food source!

When to Cut Peonies

1. Any bare-root or potted Peony may or may not produce a flower the first spring. It should NOT be cut.
2. In the second spring the Peonies will produce several flowers. It is exciting to see but do NOT cut more than a few flowers. The plant's energy is needed to help it mature further.
3. In the third spring more flowers are to be seen. Most of these flowers can be cut but it is very important to leave as many leaves as possible to store energy for next year's production.
4. In the fourth year and on, the plant will be established and will flower prolifically. Cut as many stems as needed.

Thank You, Ants

When the buds start cracking open they secrete sweet nectar-like liquid. We can learn a lot from the ants (*Go to the ant, thou sluggard... an be wise" Proverbs 6*); they protect the buds against insect predators. Ants cause no risk to Peonies.

Once the flower open, the nectar disappears and so do the ants. If there are some ants left on the buds prior to shipping, take a pail of water, turn the bunch upside down and dip buds in water and shake off the water. Lemon juice or vinegar will help as well.

Most likely the nectar is there for the purpose of protecting the reproductive organs by "glueing" shut the protective leaves around the bud.

Storing Peonies

After harvesting Peonies in the field lay the flowers flat in a designated crate or basket (something with air flow) after stripping most of the leaves, out of the sun.

Stems which are to be used in 2 or 3 days should be placed in cold water and stored in a cooler.

Stems for later use should be stored flat and dry in a container or crate; do not fill the container too full for air circulation. Groups (bunches) of 20 to 25 stems should be facing opposite ends.

Ideally, sort by variety and/or color, marking the containers with the name and date of start.

Peonies can be stored dry up to 2 months in a cooler, ideally at 38°F. (4°C.) extending the selling season and/holding them for specific occasions when they are needed. A few days prior to using the flowers, take the Peonies out of the cooler, place them in a bucket of cold water (for at least 1 day). The wilted flowers and foliage will perk up and look like freshly cut flowers after 24 hours.

Growing Herbaceous Peonies in Containers

Herbaceous Peonies are a great addition to your perennial pot program. Certain requirements need to be met in order to be successful. Since bare-root Peonies planted in containers do not flower for a few years, the grower needs to plan ahead if he wants to sell them in flower.

Peonies in containers do not react in the same way as bare-root Peonies planted in ground beds. The end consumer should be made aware of this. The reason for this is that the root system in a pot is "constrained" while the root system in the ground bed is not. Part of this is caused by less fertility and water in the containers.

Roots in the container are of a finer construction and therefore do not store the same amount of food as the ground bed roots and hence initially have less power to flower.

Because of this it is strongly suggested to use larger containers. Once the end consumer transfers the plant into the ground bed, it will take a few years to mature and produce ample flowers. Using containers that are too small will delay flowering.

Container Soil and Feed

Soil in containers differs from ground beds and should be heavier but should not stay too wet. Mix some compost through the soil and feed sparingly.

Plant Depth

Plant depth is very similar to the depth in ground beds. For optimum results the tip should be 1" (2.5 cm.) under the surface of the soil. However, in colder zones the tip should be about 2" (5 cm.) under the surface of the soil.

Size of Bare-Roots

Since it takes longer to grow saleable plants in containers, the larger size (3-5 eyes) is recommended. Plants grown in containers for two seasons will bring a higher price.

Varieties for Containers

For first-time growers of Peonies in containers it is recommended to start with the more common varieties to ensure the process is successful. After this is established, fancier varieties (more expensive) can be tried.

Container-planted Peonies can be started before the spring arrives and placed in a cool greenhouse or tunnel to ensure earlier sales.

Tree (Suffruticosa) Peonies

Although the common name is "Tree Peonies", they are technically woody shrubs which vary in height and width. They can grow as tall from 3 to 7 feet (1 to 2-1/2 meters). They produce large flowers, some up to 10" (25 cm.) in diameter, which can be used as cut flowers as well. They start flowering in early spring depending on climate zone. Tree Peonies produce nice dark green foliage during the summer which turns bronze in the fall.

Container Soil and Feed

Soil for Tree Peonies should contain high amounts of organic matter, 15% bark, 20% peat, and rich in lime. Soil must drain well. A slow release fertilizer may be added.

Plant Depth

One of the most important factors for success in growing potted Tree Peonies is the height of the pots. It is crucial that the roots are not trimmed in order to fit into the pot. This will reduce the viability of the plants.

Overwintering

After the Tree Peonies are planted it is best to overwinter them in a cool greenhouse. Keep the plants dry to reduce growth. Once past the danger of frost and spring is starting, watering can begin to stimulate growth.

Warm Climate Zones

If Tree Peonies are planted in warmer climate zones such as in California, water should be given to keep the soil moist but not wet. As soon as sprouts develops water needs to be increased to promote rooting.

Our Peony supplier is located in the northern part of The Netherlands where they hybridize, trial and grow new Peonies. The "2 R's" (Richard and Rob) are not only supplying current Peony varieties but are also enthusiastically developing new varieties. They perform extensive testing/trialing not only with the plants but also with the flowers. They test their longevity in coolers as well as their vase life before introducing them to the market.

To maintain fertility in their own fields they use their own well-composted horse manure from their horse farm. This manure is enriched with soil bacteria and minerals as well as compost. All in all, this will resound in the ears of our organic growers.

We are excited that for the varieties they grow they are using organic methods as much as possible so the new varieties have a healthy start. Their aim (which is a challenge in today's horticulture world) is to reduce dependence on chemicals by 90%. They even replaced chemical fertilizer with natural organic materials. Pure Nature is their aim which is better for flora, fauna, and humanity. All along this has been Ednie's aim as well.

No insecticides are used in their own fields. Instead, the plants are fed with liquid fertilizer (which is absorbed through the foliage). To keep plants (just like people and animals) healthy you must feed them well. (See Ednie's recommendations time and again to stay away from fungicides, unless really needed). In their sprays they add Composted Tea, Celtic Sea Salt and Sea-90 Minerals to promote healthy growth. In this way the plants are strong enough to withstand insect predators and actually become a delight for bees, bumblebees, butterflies and any other beneficial insects.

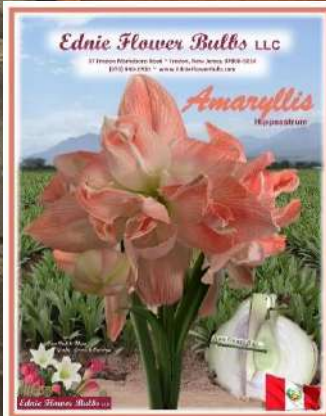

As with other crops such as Lilies and Tulips, Peonies take several years to produce viable plants. The chain from producer to grower to consumer can be quite costly. For example, if the (new) variety does not produce enough per acre or presents other problems, it has to be discarded. It also needs to produce well for the grower in their particular location and also for the end-consumer who decides if there is enthusiasm to purchase the new plant.
