

ConcreteDirect Release notes

Version 1.82 and 1.83, Expected March 23, 2021

New Features

Customer Mobile App:

- **iPad friendly interface:** The app will look and perform better when used on iPad devices.
- **“What’s in the hole?”:** The customer app will now show a running total of how much has been “Delivered” on every ticket, thus answering the question “What’s in the hole?”

Volume overview	
Total poured	252 / 252 CY
Total batched	252 / 252 CY
Total this load	144 / 252 CY
Delivery instructions	

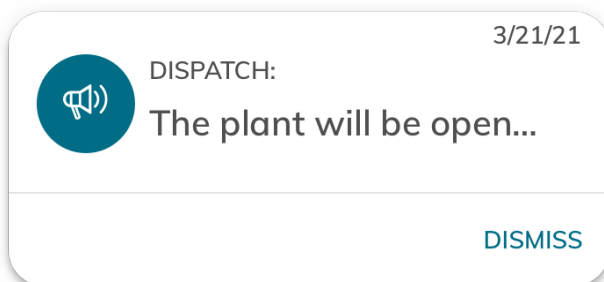

Driver App:

- **DVIR Improvement:** “This vehicle has been inspected in accordance...” language has been added to the DVIR summary details.
- **Status Improvement:** If a truck leaves a jobsite after spending 10 or more minutes “on site” then their payload will transition to “Delivered” automatically and be added to the “Total poured” amount. This allows rental trucks to be given a tablet and still send reliable statuses without driver input.

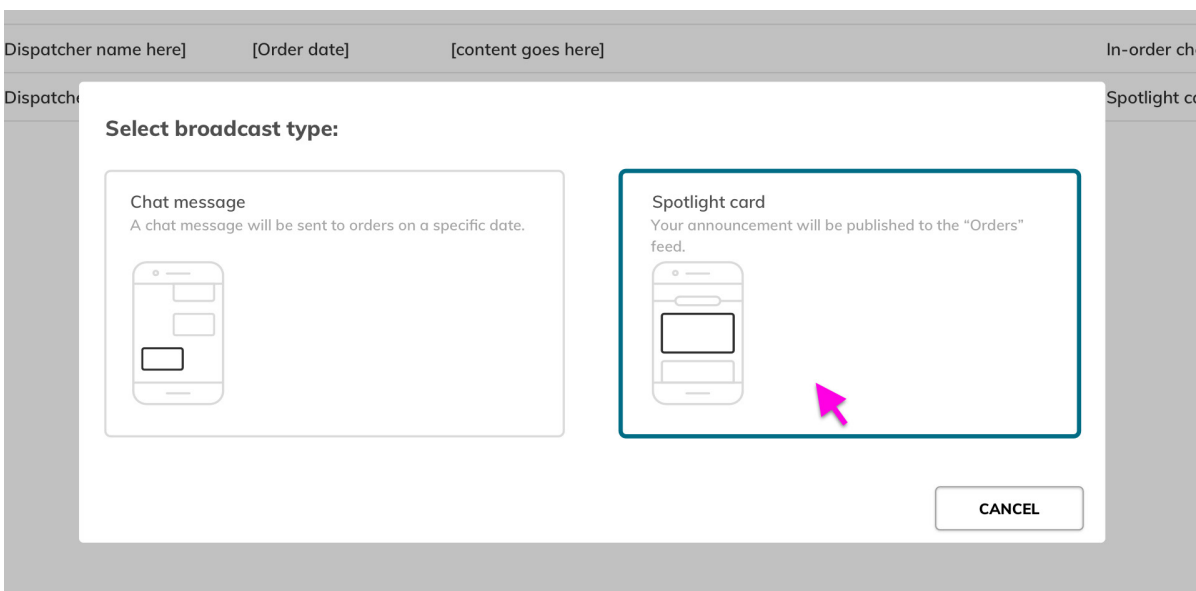

Dispatch App:

- **Exclusion of Dispatch created orders:** Dispatcher created orders will not count towards the “Orders requested” metrics on the Activity screen. Likewise, the speed at which dispatcher created orders are accepted will not contribute to the metrics on that page.
- **Dispatcher created spotlight cards:** The Broadcast feature can now also send “Spotlight cards” to the customer app. Spotlight cards are announcements that sit at the top of the customers Orders screen that can be dismissed. Spotlight cards should be used sparingly and only contain actionable information such as “The plant will be open this Sunday, please place orders!”. They can also be sent to contracts priced out of specific plants or to specific companies.

An example of the dispatcher created spotlight card, as seen by a customer in the mobile app.

After clicking the broadcast icon, dispatchers can choose what type of broadcast to send: In-order-chat or Spotlight
