Transportation Consultant

DATE: April 11, 2022

RE: Kingston Rezone
Lee County, Florida

TR Transportation Consultants, Inc. has completed a traffic impact evaluation and Level of Service analysis for the requested rezoning of approximately 6,675 acres of property generally located between SR 82 and Corkscrew Road approximately seven miles east of Alico Road in Lee County, Florida. The analysis conducted as part of this report will be based on the trip generation of the uses and intensities as agreed upon with the Developer.

TRIP GENERATION

Table 1 summarizes the uses and intensities that were used for the trip generation and Level of Service analysis for the approximate 6,675 acre subject site.

**Table 1
Land Uses
Kingston Rezone**

Land Use	Size
Residential (LUC 210)	10,011 Dwelling Units (6,674.56 acres @ 1.5 units/acre)
Retail (LUC 820)	700,000 Sq. Ft.
Hotel (LUC 310)	240 Rooms

The trip generation for land uses shown in Table 1 was determined by referencing the Institute of Transportation Engineer’s (ITE) report, titled *Trip Generation Manual*, 11th Edition. Land Use Code 210 (Single-Family Detached Housing) was utilized for the trip generation purposes of the residential uses, Land Use Code 820 (Shopping Center) was utilized for the trip generation purposes of the retail uses and Land Use Code 310 (Hotel) was utilized for the trip generation purposes of the lodging uses. The equations from the aforementioned land uses are attached to this Memorandum for reference. **Table 2** indicates the anticipated weekday AM and PM peak hour trip generation as currently proposed. The anticipated daily trip generation is also indicated within Table 2.

Note, the remaining of the analysis will be based on the PM peak hour traffic conditions since the trip generation for the weekday PM peak hour is significantly higher than the weekday AM peak hour, as illustrated in Table 2 below.

Table 2
Trip Generation – Total Trips
Kingston Rezone

Land Use	Weekday A.M. Peak Hour			Weekday P.M. Peak Hour			Daily (2-way)
	In	Out	Total	In	Out	Total	
Residential (10,011 Dwelling Units)	1,281	3,646	4,927	4,754	2,792	7,546	69,879
Retail (700,000 Sq. Ft.)	339	208	547	1,100	1,191	2,291	24,141
Hotel (240 Rooms)	63	50	113	76	74	150	2,178
Total Trips	1,683	3,904	5,587	5,930	4,057	9,987	95,198

The total trips shown in Table 2 will not all be new trips added to the adjacent roadway system. With mixed use projects, ITE estimates that there will be a certain amount of interaction between uses within the boundaries of the project that will reduce the overall external trip generation of the project. This interaction is called “internal capture”. In other words, trips that would normally come from external sources would come from uses that are within the project, thus reducing the overall impact the development has on the surrounding roadways. ITE, in conjunction with a study conducted by the NCHRP (National Cooperative Highway Research Program), has summarized the internal trip capture reductions between various land uses. For uses shown in Table 2, there is data in the ITE report for interaction between the residential, hotel and retail uses.

An internal capture calculation was completed consistent with the methodologies in the NCHRP Report and published in the ITE *Trip Generation Handbook*, 3rd Edition. The resultant analysis indicates that there will be an internal trip capture reduction of approximately nine percent (9%) in the P.M. peak hour between the residential, hotel and retail uses. The summary sheets utilized to calculate the internal capture rate for the weekday PM peak hour are attached to this Memorandum for reference.

Pass-by traffic was also taken into account for the retail uses being proposed. The current version of the ITE *Trip Generation Handbook*, 3rd Edition, indicates that the weekday PM peak hour pass-by rate for Land Use Code 820 is nineteen (19%) for shopping center with the floor area between 300,000 square feet and 900,000 square feet. **Table 3** indicates the total external trips based on the uses shown in Table 1.

Table 3
Trip Generation – Net New Trips
Kingston Rezone

Land Use	Weekday P.M. Peak Hour			Daily (2-way)
	In	Out	Total	
Total Trips	5,930	4,057	9,987	95,198
Less Internal Capture *	-454	-454	-908	-8,568
Less LUC 820 Pass-By Trips	-186	-164	-350	-4,174
Net New Trips	5,290	3,439	8,729	82,456

* Consistent with the attached Internal Capture Worksheets.

TRIP DISTRIBUTION

Table 1A, attached, illustrates the distribution of the project traffic to the surrounding roadway network. The projected 2045 Project Directional Annual Average Daily Traffic (AADT) volumes were obtained from the District 1 Regional Planning Model (D1RPM 2.0) 2045 Model that was completed for the development shown in Table 1. These volumes were then adjusted by appropriate K-factors in order to obtain the peak hour peak direction project traffic volumes as shown in Table 1A. Note, the K-factors for Lee County maintained roadways were obtained from the attached 2021 *Lee County Traffic Count Report*. The K-factors for state maintained roadways were consistent with the attached *FDOT’s District One LOS Spreadsheet*.

Table 1A also illustrates which roadway links will accommodate greater than 10% of the Peak Hour – Peak Direction Level of Service “C” volumes. The Level of Service threshold volumes for Lee County maintained roadways were obtained from the Lee County *Generalized Peak Hour Directional Service Volume* tables. The Level of Service threshold volumes for State maintained roadways were obtained from FDOT’s *Generalized Peak Hour Directional Volumes Table 7*. The Level of Service threshold volumes utilized for all roadways in the study area are shown in Table 1A. Roadway segments that are projected to be impacted by more than 10% of the Peak Hour – Peak Direction Level of Service “C” volume were then included in the Level of Service analysis conducted as part this rezoning request.

It is important to note that there were several roadway improvements that were included as background improvements in the Level of Service analysis conducted as part of this Memorandum. The following is a list of improvements that were included in this analysis consistent with the attached 2045 Financially Cost Feasible Plan;

- Corkscrew Road widening from US 41 to Airport Haul Road Ext. – 6LN
- Corkscrew Road widening from Airport Haul Road Ext. to Alico Road - 4LN
- Airport Haul Road Extension from Corkscrew Road to Alico Road – 2LN
- I-75 widening from Bonita Beach Road to Daniels Parkway – 10LN
- Alico Road Extension from Green Meadow Road to SR 82 – 2LN
- Daniels Parkway widening from Gateway Boulevard to SR 82 – 6LN
- Sunshine Boulevard widening from SR 82 to Lee Boulevard – 4LN
- Homestead Road widening from SR 82 to Sunrise Boulevard – 4LN

LEVEL OF SERVICE ANALYSIS

The link Level of Service analysis was completed based on the projected build-out year of 2045. The link data was analyzed based on year 2045 without the development and year 2045 with the development. **Table 2A**, attached, indicates the methodology utilized to obtain the year 2045 build-out traffic volumes. The 2045 peak season weekday background and project directional daily traffic volumes were obtained from the District 1 Regional Planning Model (D1RPM 2.0) 2045 Model that was completed for this project. The 2045 peak season weekday directional daily traffic volumes were then adjusted by the appropriate K factors to obtain the 2045 peak season, peak hour, peak direction traffic volumes. The K factors utilized for each roadway are included in this Memorandum for reference. Table 2A details the Level of Service analysis results for all links inside the project's area of influence.

CONCLUSION

The proposed zoning request would allow a development of up to 10,011 residential dwelling units and up to 700,000 square feet of commercial floor area and 240 hotel rooms on the parcel located between S.R. 82 and Corkscrew Road approximately seven miles east of Alico Road in Lee County, Florida.

The Level of Service analysis conducted as part of this document was based on the development program agreed upon as part of the settlement agreement between the property owner and Lee County. The transportation mitigation for this project will include the payment of road impact fees as normally collected by Lee County in addition to an additional proportionate fair share contribution to be paid in accordance with the Stipulation of Settlement Agreement between the County and the Property Owner. ***Based on the applicable Lee County regulations, the payment of impact fees and the additional payment of proportionate share mitigation as outlined in the settlement agreement, the public interest is protected.***

 - Denotes the LOS Standard for each roadway segment

* Level of Service Thresholds for Lee County arterials/collectors were taken from the Lee County Generalized Peak Hour Directional Service Volume tables for Urbanized Areas (dated April 2018)
 * Level of Service Thresholds for State roadways were taken from the FDOT's Generalized Peak Hour Directional Volumes for Florida's Urbanized Area, Table 7
 * The approximate project distribution percentages were obtained from the D1RPM 2045 Model
 1 Obtained from the D1RPM 2045 Model
 2 The K factors for Lee County roadways were obtained from the 2021 Lee County Traffic Count Report. The K factors for state roadways were consistent with the FDOT's District 1 LOS report
 3 Peak Hour Peak Direction Project traffic was obtained by multiplying the 2045 Project Directional AADT by appropriate K factors
 * For Gunnery Rd, the K factor was assumed based on the Lee County's PCS #52
 * For Alico Road extension, the K factor was assumed based on the Lee County's PCS #53
 * For Airport Haul Road extension, the K factor was assumed based on the Lee County's PCS #71
 * For Imperial Parkway, the K factor was assumed based on the Lee County's PCS #72
 * For Estero Parkway, the K factor was assumed based on the Lee County's PCS #70
 * For Alexander G Bell Blvd, Eisenhower Blvd, Sunshine Blvd and Milwaukee Blvd, the K factor was assumed based on the Lee County's PCS #6
 * For Leeland Heights Blvd, the K factor was assumed based on the Lee County's PCS #69

1 Obtained from the D1RPM 2045 Model.

2 The K factors for Lee County roadways were obtained from the 2021 Lee County Traffic Count Report. The K factors for state roadways were consistent with the FDOT's District 1 LOS report.

3 Obtained from Table 1A.

* For Alico Road extension, the K factor was assumed based on the Lee County's PCS #53.

* For Airport Haul Road extension, the K factor was assumed based on the Lee County's PCS #71.

* For Estero Parkway Extension, the K factor was assumed based on the Lee County's PCS #70.

* For Alexander G. Bell Blvd and Eisenhower Blvd, the K factor was assumed based on the Lee County's PCS #6.

¹Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

²Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

³Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

⁴Enter vehicle occupancy assumed in Table 1-P vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made.

⁵Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P.

⁶Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

One-Way Facility Adjustment Multiply the corresponding directional volumes in this table by 1.2						Lanes	Median	Exclusive left lanes	Adjustment factors		
						1	Divided	Yes	+5%		
						Multi	Undivided	Yes	-5%		
						Multi	Undivided	No	-25%		
BICYCLE MODE² (Multiply vehicle volumes shown below by number of directional roadway lanes to determine two-way maximum service volumes.)						*Values shown are presented as peak hour directional volumes for levels of service and are for the automobile/truck modes unless specifically stated. This table does not constitute a standard and should be used only for general planning applications. The computer models from which this table is derived should be used for more specific planning applications. The table and deriving computer models should not be used for corridor or intersection design, where more refined techniques exist. Calculations are based on planning applications of the HCM and the Transit Capacity and Quality of Service Manual.					
Paved						*Level of service for the bicycle and pedestrian modes in this table is based on number of vehicles, not number of bicyclists or pedestrians using the facility.					
Shoulder/Bicycle						* Buses per hour shown are only for the peak hour in the single direction of the higher traffic flow.					
Lane Coverage	B	C	D	E		* Cannot be achieved using table input value defaults.					
0-49%	*	150	390	1,000		** Not applicable for that level of service letter grade. For the automobile mode, volumes greater than level of service D become F because intersection capacities have been reached. For the bicycle mode, the level of service letter grade (including F) is not achievable because there is no maximum vehicle volume threshold using table input value defaults.

ADDITIONAL STAFF QUESTIONS:

RFI-1 Question – Can we provide a map that has the “Priority Acquisition Map” overlaid onto the Project site plan.

Answer – See attachment “Q”.

RFI-2 Question – Can we provide a map that has the “Priority Acquisition Tier Map” overlaid onto the Project area map.

Answer – See attachment “R”.

RFI-3 Question – Can we provide a map that has the “Priority Restoration Map” overlaid onto the Project area map.

Answer – See attachment “S”.

May 12, 2022

ADDITIONAL STAFF QUESTIONS:

RFI-4 Question – If agricultural uses are intended to be discontinued in phases as the development builds out, where will the access points be within the Property to maintain agricultural operations?

Answer – For agricultural access, see attachment “T”

RFI-5 Question – what is the purpose of the request?

Deviation 5 grants relief from LDC Section 10-291(3), which requires that residential development of more than five acres and commercial development of more than ten acres provide more than one means of ingress and egress, to allow one ingress and egress per initial construction of a residential or commercial pod with the remaining access point(s) installed prior to completion of the residential or commercial pod.

Answer – Each residential pod of more than 5 acres or commercial pod of more than ten acres will be designed to provide a minimum of two means of ingress and egress. At time of initial construction, and because of the size of the development pods, the initial phase of the residential or commercial pod may not be large enough to accommodate the second permanent access drive. The intent would be to construct one permanent paved access roadway and construct a temporary stabilized roadway for emergency access to be used until such time as the development phasing of construction can complete the second pod access.

In addition, Deviation 5 wanted to be clear that the Kingston Parkway spine road will be connected to Corkscrew Road and State Road 82 in a process and timing as determined by the Developer and is not required to connect to both Corkscrew Road and State Route 82 immediately as the development pods are connected to it since the spine road design is providing 2-lanes in both directions separated by a large, grassed median.

RFI-6 Question – Where is the “confining layer” in relation to a lake depth of 35’?

Deviation 2 grants relief from LDC Section 10-329(d) (3)a, which requires lakes to be limited to 20ft depth to allow for a maximum lake excavation depth not to exceed 35ft or one foot above the confining layer whichever is less.

Answer – See attachment “U”.

RFI-7 Question – Clarify Deviation 8?

Deviation 8 seeks relief from LDC 10-285, which requires an access separation of 660 feet along principal arterials in Future Non-Urban areas to allow a connection separation distance of 460’, as depicted on the MCP.

Answer – There are two Deviation 8 locations shown on the MCP. One of the locations is located on Corkscrew Road near the “donut hole” in the property ownership to accommodate the separation between the existing driveway that accommodates those property owners and the adjacent residential pod entry. The other location is also on Corkscrew Road to allow a reduced separation between the commercial pod entries and the Kingston spine road. This lessened separation will allow for further flexibility of the commercial site plan for the eventual end user. See attachment “V”.

RFI-8 Question – The Project restoration describes “water benefits” in various locations within the settlement documents. Can a simplified summary be provided to describe the Project water benefits? Can you describe any adverse conditions that exist today and what measurement the Project is intended to improve?

Answer – The Kingston project will provide a number of benefits to the region as it relates to surface water and groundwater. First, and in accordance with the Lee Plan objective to reconnect historic pathways, the project will reconnect and re-establish flow patterns that have been severed by agricultural use and configuration that currently exists. These connections will provide the following benefits:

- Proposed assistance consists of installing an overflow structure in our NE corner of the project to allow water from a Leigh Acres LAMSID canal to flow into our property during excessive rainfall and when flooding stages reach a certain elevation. There is documented occurrences of flooding within this portion of Lehigh Acres and this connection will provide a benefit by providing another route to send surface water when needed.*
- Proposed assistance consists of removal of the impoundment berm along our east property line to allow additional offsite sheet flow onto the property, instead of staging up in Wildcat Farms. There may also be opportunities to install 2-3 hydraulic connections from roadside ditches within the Wildcat Farms area into our property at a controlled rate. These additional connections will allow a place for water to go, reducing flooding potential currently seen in these areas. As it exists today, Wildcat Farms experiences frequent flooding due to the lack of outlet for runoff in the area.*

Also, the project proposes a number of delineated flow-way basins that will allow for attenuation and elevation control of the water. This configuration allows for increased recharge potential to the groundwater table, increased and healthier hydroperiods within the existing wetlands, flood control, and increased treatment post the existing ditch system that exists today. In particular,

the project's flow-way system design includes an approach to addressing the issue with insufficient hydroperiods occurring within the existing wetlands systems of the Audubon lands, located downstream of the property. In a recent hydrologic modeling project for the National Audubon Society's Corkscrew Swamp Sanctuary, dated February 2021 and prepared for the South Florida Water Management District, the results of the study indicate that one of the main factors affecting the wetland hydroperiods is downstream drainage and conveyances. The study also demonstrated that nearby agriculture uses, and increased groundwater usage/pumping also adversely impacted the hydroperiods, due to lack of groundwater recharge and the increased spread of the willow plant. The Kingston Property Hydrological Restoration Plan aims to significantly reduce the groundwater usage with the elimination of the agriculture activities. The flow-way design of the restoration plan will provide surface water storage capacity upstream of the Audubon lands with the intent to further increase groundwater recharge and to properly manage (timing and flow) discharge into the Audubon lands to improve hydroperiods. The project's design includes slowing down the discharge to a more controlled rate with the installation of filter marshes and weirs throughout multiple basins upstream of the property. Current conditions allow water to flow as fast as possible to the property with no treatment, resulting in higher nutrient loadings and increased inundation during times when its not needed. Providing a more controlled discharge should improve water quality leaving the site and controlling the discharge will also allow for longer more stable hydroperiods of downstream wetlands.

RFI-9 Question – The size of the Project is very large. Can a “table” be provided comparing this Project to other existing EEPKO developments?

Answer – See attachment “X”.

RFI-10 Question – Provide pictures of the Property as it exists today along with completed environmental restoration pictures from nearby EEPKO development.

Answer – Existing pictures are of the existing project property and “restoration completed” pictures are taken from The Place (aka Corkscrew Farms) development. See attachment “Y”.

RFI-11 Question – Within the Restoration and Phasing Plan depicted on Exhibit “G” it does not appear as though any restoration is being performed on Pods 17, 18, or 19. Why not?

Answer – Restoration is shown on Pod 17 and is included with the restoration of Pod 16. Pod 18 is the remainder of the “land swap” property currently owned and to be retained by Lee County. Pod 19 is the parcel being given to the County of equal area of the “land swap”. Both Pods 18 and 19 will remain owned by Lee County and will not be subject to the 50% restoration requirement.

RFI-12 Question – Summarize areas for conservation, flowway, and restoration lands.

Answer – Restoration will occur in both conservation easements and flowway easements totaling a minimum of 3,287-acres. Conservation easements will contain all existing and mitigated wetlands equal to approximately 1,192-acres and all the remaining property not designated as development pods or roadways will be placed into

flowway easement equal to approximately 2,095-acres. It should be noted that the value of the restoration, at no cost to a 20/20 acquisition or Lee County taxpayers, is projected to be \$101,897,000 plus an expected annual maintenance cost of 1,700,000 per year.

RFI-13 Question – Are there any proposed or expected wetland impacts on the proposed commercial Pods?

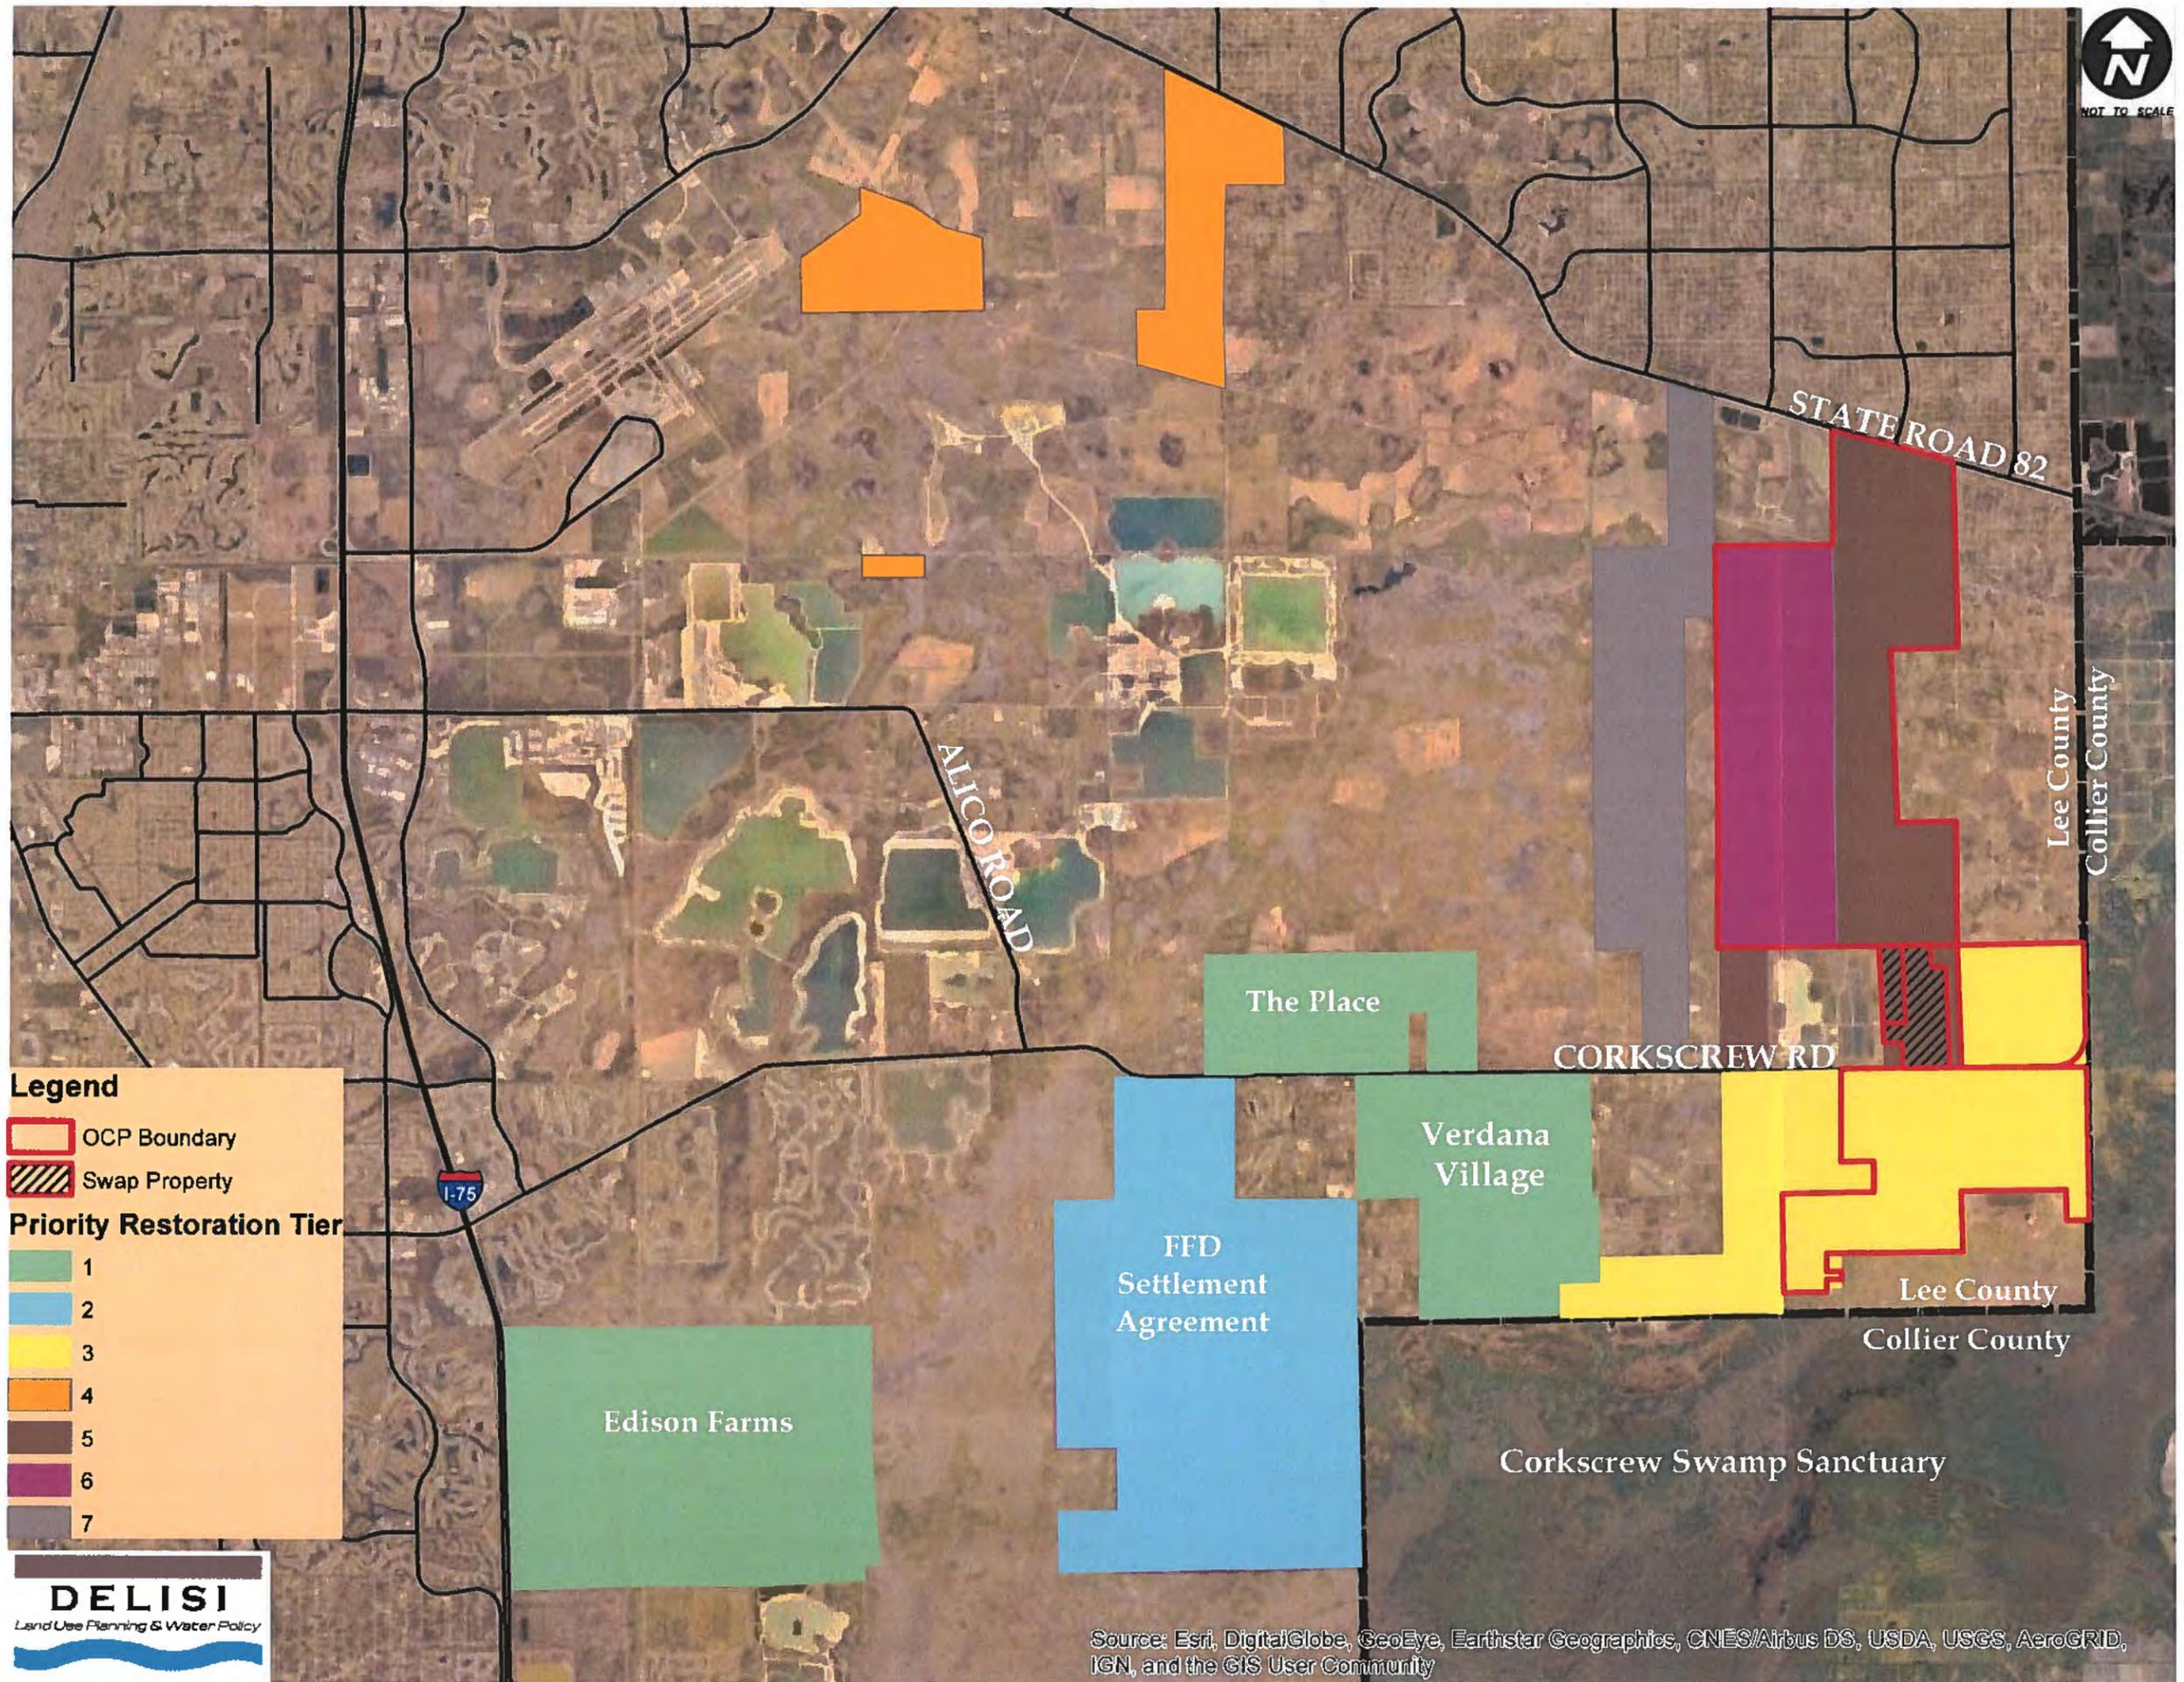

Answer – There will be no wetland impacts from the commercial Pods.

RFI-14 Question – How are traffic impacts being mitigated?

Answer – Impacts are being mitigated by (1) the Development constructing an approximate 5.5-mile spine road built to county specifications as a “collector” road, connecting Corkscrew Road to State Road 82 and dedicated to the County with the cost borne by the Developer at an approximate cost of \$40,000,000, this provides for a northerly and southerly roadway to provide for sufficient traffic distribution to the north; (2) an obligation to pay \$2,000.00 per residential unit equivalent to \$20,000,000 in proportionate share for local roadway improvements including culverts and potential wildlife crossings;, and (3) road impact fees equivalent to 54,980,000.

CGLP SETTLEMENT AGREEMENT PROJECT DESCRIPTION

The settlement agreement between Corkscrew Grove Limited Partnership (“CGLP”) and Lee County includes a plan to eliminate mining and designate the subject property for natural lands, restoration, and conservation uses, as well as the development of residential, commercial, and public facilities. The following planning narrative describes the site plan, the benefits of the conversion from active agriculture to conservation uses and land development, and the areas of deviation from the Lee County Comprehensive Plan (Lee Plan). A narrative on how the conditions of development ensure that the public interest is protected and maintained through this settlement agreement is also provided.

Site Plan

The proposed **6,676-acre** site plan **eliminates the 4,202-acre limerock mining use previously requested on the subject property**. In place of mining operation and ancillary industrial uses, the site plan now shows **4,071 acres** in open space which includes **3,287 acres** of restoration and conservation to natural lands. The restoration component will convert more than **1,915 acres** of active citrus grove, sod, and row crops into indigenous areas, flowways, and other forms of open space. The site plan also includes enhancing, restoring, and improving more than **1,192 acres** of existing wetlands, and placing all those areas into easements to be maintained and protected in perpetuity. The construction of water management features will result in significant water quality enhancements. Landscape buffers and other green space shown on the site plan reflects a minimum of 61% of the property, equivalent to **4,071 acres** of the site, which will be dedicated to open space. The remaining **2,602 acres** of the property will permit development that includes a mixed-use residential community with a gross density of 1.5 units per acre and 700,000 square feet of commercial floor area, 240 hotel units and on-site recreational amenities for residents.

The concept plan was designed to follow the general intent of the plan amendment/zoning approvals for properties in the Density Reduction Groundwater Resource (DR/GR) areas along State Road 82 combined with the intent of the Environmental Enhancement and Preservation Communities Overlay (EPPCO) for properties along Corkscrew Road. Historic flowways were analyzed and incorporated into the site plan and the conservation areas were identified that will both follow and re-establish historic flowway corridors, provide significant wildlife corridors, and provide connections to adjacent preserve areas surrounding the property. Several large wildlife corridors will be created to allow large mammals to move across the property going both north-south and east-west. The intent is to enhance the wetland areas by surrounding them with restoration, as described in the Southeast Lee County policies. Flowways will be designed to help manage discharges south into the Corkscrew Swamp Sanctuary and CREW Watershed conservation lands in Collier
