

# Mercury LUX Firmware 2.0

We are pleased to announce the release of version 2.0 of the PC software and firmware for our Mercury LUX product. This update includes significant enhancements:

1.Optimized Protections: The LPF error algorithm has been refined to make it less sensitive and more precise, enhancing system reliability.

2.Input Equalization: Input response has been adjusted for greater performance and amplifier output linearity, which may result in slight variations in input gain across bands.

3.Compatibility and Software Enhancements: The new PC software 2.0 introduces key features such as program muting, Fahrenheit readings, antenna switching, and a more modern and attractive interface. Additionally, it includes improvements in the linear indicator bars, now featuring a smoother peak hold display.

Note: PC software 2.0 is exclusively compatible with firmware version 2.0.
