How to use a Twining Loom

Twining is a weaving technique where two or more flexible weft strands are twisted around vertical warp threads. Unlike standard over under weaving, twining pairs of wefts twist together between each warp, creating a strong, stable, and often braided texture. A twinning loom (often called a twining loom) is a simple wood frame used to make rag rugs, mats, chair pads. Instead of weaving over under with a shuttle, twining uses two weft strands that twist around each warp pair. This makes a thick, sturdy fabric, perfect for upcycled fabric strips. You will receive a placemat size Twining Loom to keep and the fabric will be provided. You most likely will not finish your project during class but will have enough fabric to finish at home. I will also have a video for you to have as a reference while at home.

Material fee to be paid to the instructor on the day of the class $80
