# AI Militarized Systems: Peace or Conflict? Ethics and Regulations

AI has the potential to create peace, but it can also lead to more warfare. All the delegates that spoke agreed that safety is the priority, but the issue wasn't whether or not to use AI, it was how to use it responsibly.

Everyone was aware of what the use of AI could cause, such as taking away accountability from humans or dangerous malfunctions that could cause major casualties, like the quote stated in the lower right corner. Brazil said we need a new system, with AI being apart of an outdated system. While other delegates, including Austria, were open to the idea, they suggested to build off of the treaties and organizations that are already available to the counties.

"A machine gun can fire 600 " bullets under a minute, now imagine many machine guns stacked up and accidentally fired at the press of a button because it (AI) detected civilians and not a soldier"

-Brazil

Switzerland brought up two key points. The first point being how everyone was staring solutions without seeing the route of the problem, the second point being "a machine gun can fire 600 bullets under a minute, now imagine many machine guns stacked up and accidentally fired at the press of a button because it (AI) detected civilians and not a soldier." this pinpoints how the topic challenges ethics and how other countries mentioned AI being unethical. Switzerland brought up the question that undermined the countries statements. To conclude, the delegates decided that more research should be done on AI and creating updated precautions are necessary for the protection of citizens across the world.

## CRISIS UPDATE

Breaking news, France misfired a nuclear missile at Naples, Italy after experimenting for a while with these sorts of nuclear weapons. Around 6,000 people died upon the impact and more have been injured. Due to the severity of the nuclear missile it has contaminated the air and water. The contamination will spread to neighboring countries and can drastically affect people's health.

"Whose ethics are you basing it off of?"  
-Switzerland
