Rising Rates of People With Diabetes: How Will the Delegates Handle this Issue?

In a heated debate, the World Health Organization discussed the issue of rising diabetes in developing countries. Some countries believed in the use of AI while some believed in reconstructing the World Health Organization. These delegates need to work together to create an effective solution that benefits everyone. The delegates were debating over the issue of the increase in diabetes in developing countries due to lack of funds. This is a major issue in the world that was to be discussed seriously. Many solutions were brought up in the debate, but they need to find one that works for every country.

Many ideas were discussed during this debate. Starting off with Canada. The delegation of Canada had a unique idea to reorganize the way the World Health Organization distributes its funds and supply to all of the countries. Canada's plan was to distribute the money by having a database to determine which developing countries needed the money and supplies the most. A majority of the countries disagreed with this proposal. A more popular solution was proposed by the delegation of Bangladesh. Bangladesh planned on educating their citizens through required learning programs to inform everyone about the dangers of diabetes and ways to prevent it. Many other countries agreed with this plan for education or had similar ideas to solve this issue such as Brazil, Ireland, Syria, South Africa, and Spain. While most delegates agreed with the education solution, another solution was proposed. China presented the idea of either creating a ban or law against products using high sodium, sugar, and dyes while also creating a tax break on companies with healthy ingredients and putting a tax on companies using these unhealthy ingredients. Not many countries agreed with this solution, claiming it was "unrealistic." The final solution proposed was proposed by France. The delegation of France stated that developing countries should be receiving more insulin, or more money for insulin. Countries like Oman and India agreed with this solution, claiming that it was "the easiest solution." Canada, Ireland, and China were constantly arguing over the best solution for this issue while the rest of the delegates took sides and all said similar things.

"Food and medicine come from the same origin"

—China

There were three main solutions proposed during this debate. The first one was redistributing the funds from the World Health Organization to countries who need it more. The second solution proposal was to create mandatory education programs for countries who may not know how to prevent diabetes. The last idea was to ban products using unhealthy ingredients and tax them. While giving health food companies tax breaks to encourage other companies to produce healthier options. During this conference many effective solutions were proposed. Although there were many disagreements, all of the countries have the same goal. To decrease this horrible disease, what solution will be most successful? Only time will tell.

CRISIS UPDATE

Shocking update, there is now a deadly virus found in chicken limbs. It is called Paranal Perplexity Virus. One of the first victims is seen to have high fevers, severe chills, and hives. This virus is resulting in a need for amputating limbs due to the virus decreasing blood flow to limbs. If this virus is not treated within 24 hours, death is a high possibility. Doctors really recommend to avoid eating chicken meat at all costs to prevent this virus. As of right now there is no cure, but hopefully one will present itself soon.

"We must reorganize the way WHO distributes their funds and supply, by giving more to the countries who need it the most"

—Canada
