Glossary of Terms

BREAKING STRENGTH

This is the approximate load which, when applied at a point two feet below the tip of the pole, will cause structural failure of the pole.

CONCRETE STRENGTH

This is a reference to the compressive strength of the concrete in pounds per square inch as measured by testing representative samples at twenty-eight days after casting.

DEAD LOAD

This refers to the load on the pole resulting from the attachment of luminaires, luminaire supports and other permanent attachments.

E.P.A "Effective Projected Area"

This is the effective projected area in square feet of luminaires, luminaire supports and other permanently attached items which are subject to wind load.

GROUND LINE

The point at which an embedded poles enters the ground or is otherwise restrained.
The point at which a pole with a bolt-down base is attached to the foundation.

GROUND LINE BENDING MOMENT

The product of any horizontally applied load at any point on the pole multiplied by its height above ground line.

LIVE LOADS

These are loads applied to the pole as a result of wind, ice or other loads of temporary nature.

ULTIMATE GROUND LINE BENDING MOMENT

This is the bending moment, applied to the pole which will cause structural failure of the pole. This is the result of multiplying the load indicated in the column titled "Breaking Load" times a distance of two feet less than pole height (length of pole above ground). The ultimate ground line moment is the product of the nominal bending strength multiplied by a strength reduction factor of 0.9 per ACI 318 latest edition. Figures in "Ultimate Ground Line Moment" column assume embedment of 10% of pole length plus two feet; however, these same Moments apply to bolt-down base poles. The figures in this column on technical charts are maximum moments expected to be applied to the pole (or foundation). Appropriate load factors should be used by the designer.

General Information

- 1) Different colors, finishes and exposed aggregate are available upon request.
- 2) Longer lengths of poles available upon request.
- 3) 7000 PSI concrete is standard; higher strengths are available if required.
- 4) STRENGTH: In most cases a higher ground line moment, breaking strength and EPA can be attained without going to a larger pole.
- 5) EFFECTIVE PROJECTED AREA (EPA): Lonestar Prestress Mfg., Inc. concrete poles and mounting arms have been designed in accordance with accepted engineering practices to be structurally capable of withstanding wind loads and velocity pressure using a gust wind speed of at least 140 mph. Poles to meet higher wind loads are available.
- 6) HOLES: Holes are precast to meet your specifications and requirements for mounting attachments, most any desired arrangement can be provided. Contact Lonestar Prestress Mfg. for any questions about field drilling poles.
- 7) INSTALLATION: Lonestar Prestress Mfg. concrete poles are designed for setting directly into the ground, without the use of poured in place foundations, similar to the setting of wood poles. After the hole is drilled, the pole is set and plumbed, the earth is then back-filled and tamped. The depth is dependent on the nature of the soil and the anticipated load. Where it is impossible to embed the poles in the ground, such as on bridges or overpasses, a boltdown base plate is available.
- 8) To specify a base plate for base mounted poles add the suffix BP to catalog numbers. Customer to supply the bolt circle drawings or template.

Product Code Legend

I-2

CONCRETE POLES

The 1st two digits of the product code depicts the size of the pole relative to total length.	The 3rd digit of the product code depicts the type of pole relative to strength and engineering.	The 4th digit of the product code depicts the type of mounting related to the fixture to be used or any other special feature of the pole.	The 5th digit depicts the pole relative to the shape. For brackets (96) the 5th digit depicts length in feet.	The 6th digit of the product code depicts the pole relative to the color and finish.	The 7th digit, after the dash, represents the number of dormant strands in the pole.

Basic Wind Speed ASCE 7-05, Minimum Design Loads for Buildings and Other Structures, American Society of Civil Engineers.

The basic wind speed, V, used in the determination of design wind loads on buildings and other structures, shall be as given in Figure 6-1 of ASCE 7-05.

Technical Information

E-1

Strength

Ultimate strength design theory is used to determine the ultimate groundline moments shown in the technical charts. The location of the ultimate ground line moment is determined using an assumed embedment of 10% of the overall length of the pole plus 2 ft. In many cases a higher groundline moment may be attained without going to a larger pole. Please contact our technical staff for special requests.

Wind Loads

Wind loads for determining the maximum effective projected areas (EPA) presented in this catalog were determined in accordance with ASCE 7-05, *Minimum Design Loads for Buildings and Other structures*. The effective projected area is the actual projected area subjected to wind times the appropriate coefficient of drag (Cd). Please note our catalog features EPA's for 90 mph, 110 mph, 130 mph, 140 mph, and 160 mph wind zones. EPA's for higher wind velocities can be attained by special design. Please contact our technical staff for special requests.

Wind pressures determined using the criteria of ASCE 7-05 are based on gust wind speeds. Editions previous to ASCE 7-95 were based on fastest mile (sustained) wind speeds. For example, if your specification calls for the design of a prestressed concrete pole to be based on a wind velocity of 100 mph with a 1.3 gust factor then you would select a pole from our catalog based on a gust wind speed of 130 mph. The following table provides a quick conversion of sustained wind speeds to gust wind speeds using a typical gust factor of 1.3:

Sustained Wind Speed Per ASCE 7-93 (mph)	Sustained Wind Speed Per ASCE 7-93 with 1.3 Gust Factor (mph)	Gust Wind Speed Per ASCE 7-05 (mph)
80	104	110
90	117	120
100	130	130

10% plus 2 foot" Rule of Thumb for the Direct Embedment of Concrete Poles

Pole Length (Ft.)	Embedment (Ft.)	Height Above Grade (Ft.)
15	3.5	11.5
20	4.0	16.0
25	4.5	20.5
30	5.0	25.0
35	5.5	29.5
40	6.0	34.0
45	6.5	38.5
50	7.0	43.0
55	7.5	47.5
60	8.0	52.0
65	8.5	56.5
70	9.0	61.0

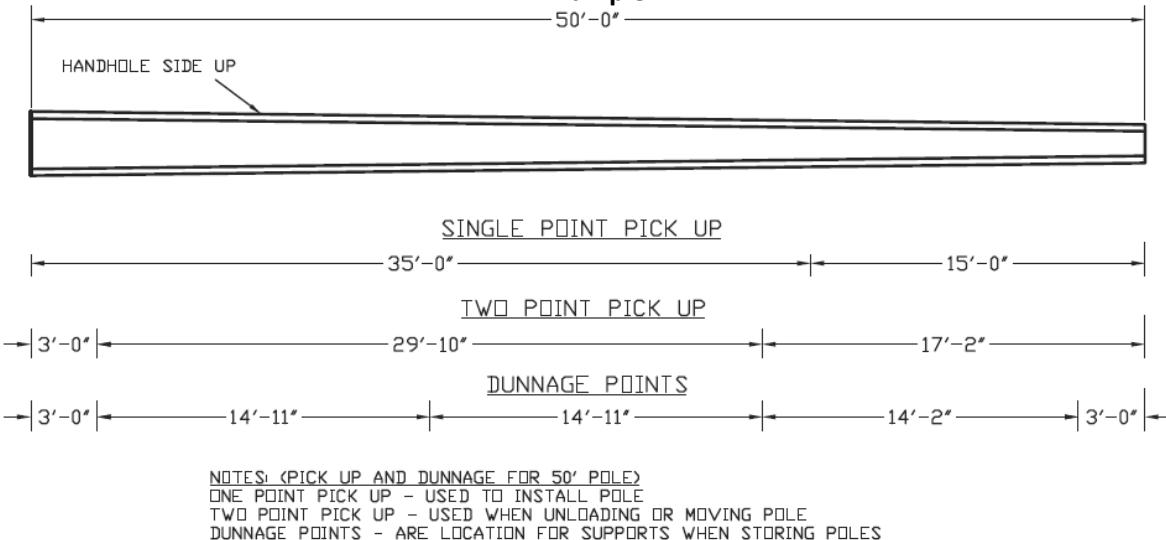

The hole diameter selected for the embedment should allow a minimum clearance around the corners of the pole butt of 4 to 6 inches. Hole sizes are generally specified in 6 inch increments to accommodate standard auger sizes. The hole diameter for octagonal poles may be determined by adding 8 to 12 inches to the width of the pole butt.

Handling and Installation Procedures

Handling Instructions

- Prestressed concrete poles will withstand a considerable amount of bending but should not be shock loaded while under load.
- Prestressed concrete poles should never be handled or picked up by the tip.
- When shipping poles, the poles should be supported at a minimum of 3 points for poles up to and including 40 feet and 4 points for poles over 40 feet.
- Poles up to 50 feet in length may be unloaded using a one-point pickup at the balance point but should never be transported in this manner. A two-point pickup must be used to transport a pole at the job site.

Example

Installation Procedure

- Prior to installation of the pole, electrical wiring, brackets and luminaries can be installed while the pole is lying horizontally on the ground.
- Excavate the proper diameter and depth hole. The preferred method of excavation is by auger type drilling.
- To install, choke the pole with one end of a nylon sling 25% to 30% of the pole length from the top (see Handling section for location). Attach the other end of the sling to the lifting hook of the crane.
- Lift the pole allowing the butt to rest on the ground until vertical.
- Lift the pole over hole and lower until butt rests on bottom center of hole.
- While holding pole, add backfill in 4 to 6 inch layers, tamping between placement of each layer. Check for plumbness throughout the backfilling process.
- If the pole is equipped for an underground connection, stop backfilling to a point 6 inches below the connection. Make the connection and then finish backfilling the hole to a point 2 inches above grade.

Direct Embedment

Direct embedment is the most common and recommended method of installation of prestressed concrete poles. Soil conditions vary from location to location and should be investigated by an engineer prior to designing the foundation. The "rule of thumb" for the depth of embedment is 10% of the overall length plus two feet. The table on the preceding page is based on the "rule of thumb." Depending upon the type of soil, an appropriate backfill should be selected. The chart below contains suggested guidelines for the selection of backfill:

Good Soil: Compacted well graded sand and gravel, hard clay or well graded fine and coarse sand.	The excavated soil may be used as the backfill.
Medium Soil: Compacted fine sand and clay, compact sandy loam, loose coarse sand and gravel.	Requires select backfill. Clean, washed sand or minus 1/2 inch well graded gravel may be used.
Poor Soil: Soft clay, clay loam, poorly compacted sand or clays containing large amounts of silt.	Requires one of the following: cementitious earth, cement stabilized sand, limestone screenings, or urethane foam.

Concrete Pole Specifications

E-3

1.00 SCOPE

1.10 This specification is to establish design and quality standards for static cast concrete poles for power distribution or lighting. All pole design structural calculations shall be prepared by a licensed engineer experienced in pre-stressed concrete design.

2.00 GENERAL

2.10 The concrete poles furnished under these specifications shall be designed and manufactured in accordance with requirements and/or recommendations of the American Concrete Institute Standard "Building Code Requirements for Structural Concrete" (ACI 318 - Latest Edition), unless otherwise specified.

2.20 Poles shall be designed in accordance with the Prestressed Concrete Institute "Guide for Design of Prestressed Concrete Poles."

3.00 PHYSICAL CHARACTERISTICS

3.10 All poles shall be prestressed concrete and suitable for direct embedment into the ground without special foundations.

3.20 Shape and Length: Poles shall be square in cross-section, with chamfered corners, and shall have a standard taper of 0.162 inch per foot. Cross-sectional dimensions shall not deviate by more than 3/8 inch. The allowable tolerance for overall length shall be +3 inches and -2 inches. The width of the bottom face of the pole (as it is cast) may be less than the top face.

3.30 Finish: The pole shall have a smooth uncolored finish with no cracks. The top surface of each pole shall be troweled until all projections, depressions, and irregularities have been removed and the entire surface has a smooth texture and neat lines. Square corners and sharp edges shall be tooled to form smooth, chamfered corners.

All small cavities shall be cleaned, saturated with water and then filled with mortar. A small cavity is defined as one larger than 1/4 inch but smaller than 3/4 inch in diameter, and less than 3/8 inch deep. Larger non-structural cavities and spalls shall be repaired by opening the side of the damaged area on a 1 to 1 slope using a mechanical grinder, cleaning thoroughly and filling with a high-strength non-shrink concrete repair material. Poles with other defects may be repaired only upon authorization of, and using the method prescribed by the Design Engineer.

3.40 Sealing Steel Strands: The end of each steel reinforcing strand (in the top and butt) shall be burned back to a minimum depth of 1/2 inch. The holes left by the removal of the strand shall be thoroughly cleaned of any loose residue. The holes shall then be completely filled with non-shrink grout and smoothed evenly with tip or butt surface.

3.50 Cover: The prestressing strands shall have a minimum concrete cover of 1 inch, except that Type I poles will have a minimum cover of 3/4 inch. The centerline axis along the faces of the poles shall be clear of embedded steel except for stirrups, spiral reinforcement and fabrication devices, so that 3/4 inch diameter holes may be drilled without interference from the strands.

3.60 Sweep: Sweep is the deviation of a pole from straightness. A straight line joining the edge of the pole at the butt and the edge of the pole at the top shall not be distant from the surface of the pole at any point by more than 3/8 inch for each 10 feet of length.

3.70 Hole Drilling: Poles shall be drilled in accordance with approved drawings. The location of holes shall not deviate by more than 3/8 inch. Holes drilled after removal from molds shall be drilled from both sides of the pole and shall be uniform in entrance and exit. Holes drilled from opposing sides of the pole must be in the same plane and be centered on both faces.

3.80 Cable Entrances: Two cable entrances with couplings shall be cast in all poles 90 degrees to the handhole unless otherwise specified by the customer.

Concrete Pole Specifications

4.00 MATERIALS

4.10 Chloride Content: The chloride content of the concrete mix, including all ingredients, shall be 0.4 pounds per cubic yard, or less.

4.20 Corrosion Resistance: All inserts or attachments, if required, shall be of noncorrosive material or galvanized.

4.30 Concrete: Concrete used in poles shall have a compressive strength at transfer of not less than 4,000 PSI, and a 28-day compressive strength of not less than 7,000 PSI, unless otherwise specified.

4.40 Material shall comply with the most recent revision of the following ASTM Standards:

- | | |
|------------------------------|------------------|
| a) Portland Cement | ASTM C105 |
| b) Admixtures | ASTM C494 |
| c) Aggregates | ASTM C33 or C330 |
| d) Reinforcing Bars | ASTM A615 |
| e) Cold Drawn Spiral Wire | ASTM A82 |
| f) Prestressing Strand, 270K | ASTM A416 |

5.00 STRENGTH REQUIREMENTS

5.10 Poles of each standard type, unless otherwise specified, shall be designed to withstand the rated design (cracking) and ultimate strength shown in the following tables, with modifications to accommodate allowances for handling, transportation and erection. The rated strength is that load which, if applied, in a direction perpendicular to the axis 2 feet below the pole tip and with the bottom of the pole (ten percent of its length plus two feet from the butt) held firm, will produce the first sign of hairline cracks. The ultimate strength is the load at which point failure occurs.

5.20 All poles shall be capable of withstanding single point pickup from the horizontal position when lifting from a point 30% of the overall length down from the tip.

6.00 GROUNDING

6.10 A PVC conduit for customer to pull a ground wire through can be cast in poles if required by the customer and included with bid to customer.

7.00 QUALITY CONTROL

7.10 Tests shall be made and records shall be maintained in accordance with the requirements of Prestressed Concrete Institute MNL-116, "Manual for Quality Control for Plants and Production of Precast Prestressed Concrete Products."

8.00 DRAWING AND DESIGN INFORMATION

8.10 Upon request, Lonestar Prestress Mfg., Inc. will furnish detailed design drawings and computations for the poles bid or supplied, including but not limited to the following:

- 1) Total weight and center of gravity of each pole.
- 2) Calculations of cracking and ultimate moment capacities at not more than 5 foot intervals.
- 3) Dunnage and pickup points, including both one-point and two-point pickup locations.
- 4) Detail of cross section and all points where reinforcing changes.

9.00 INSTALLATION

9.10 Poles shall be supported and protected during site storage, lifting and setting to prevent damage to the pole. Spalls or other damage incurred during these operations shall be repaired to restore the pole to "as new" condition.

General Information

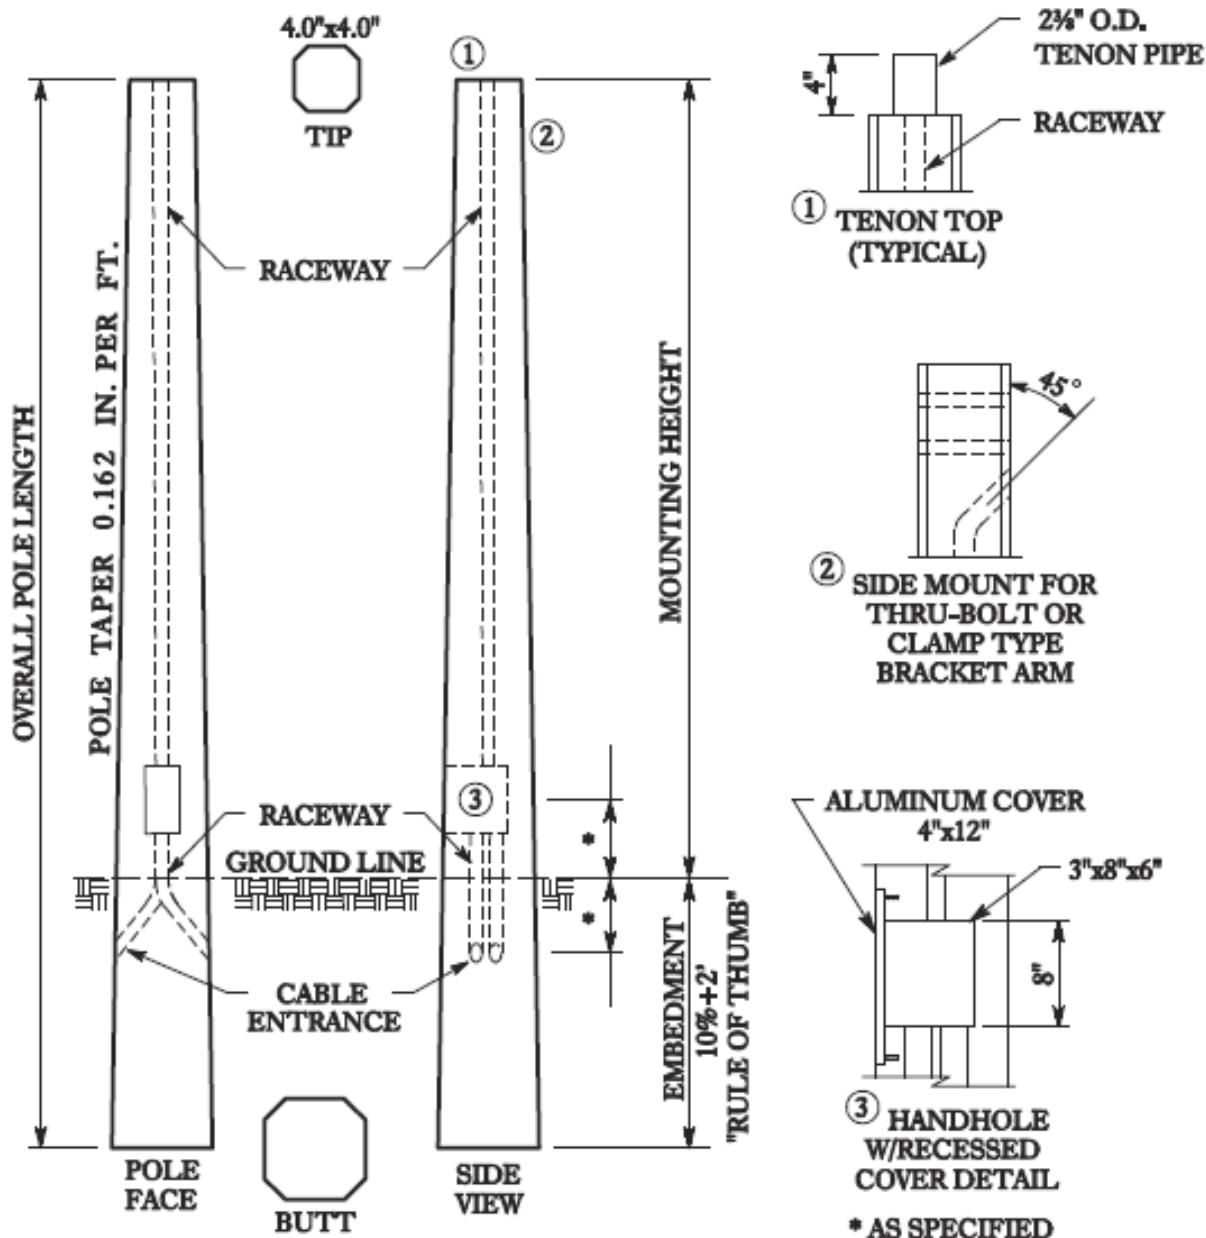

1. Different colors, finishes and exposed aggregates are available upon request.
2. Longer lengths of poles available upon request.
3. All corners are chamfered.
4. 7,000 PSI gray concrete is standard; higher strengths are available if required. The EPA's listed for poles using 7,000 psi concrete shall be reduced by 15% when decorative mixes are used.
5. STRENGTH: In most cases a higher ground line moment and a higher breaking strength and EPA can be attained without going to a larger pole.
6. EFFECTIVE PROJECTED AREA (EPA): Lonestar Prestress Mfg. concrete poles and mounting arms have been designed in accordance with accepted engineering practices to be structurally capable of withstanding wind loads and velocity pressure per ASCE 7-05. Poles to meet higher wind loads are available.
7. HOLES: Holes are precast to meet your specifications and requirements for mounting attachments, most any desired arrangement can be provided. Contact Lonestar Prestress Mfg. for any questions about field drilling light poles.
8. INSTALLATION: Lonestar Prestress Mfg. concrete poles are designed for setting directly into the ground, without the use of precast foundations, similar to the setting of wood poles. After the hole is drilled, the pole is set and plumbed, the earth is then backfilled and tamped. The depth is dependent on the nature of the soil and the anticipated load. Where it is impossible to embed the poles in the ground, such as on bridges or overpasses, a boltdown base plate is available.
9. To specify a base plate for base mounted poles add the suffix BP to catalog numbers. Customer to supply the bolt circle drawings or template.

7. HOLES: Holes are precast to meet your specifications and requirements for mounting attachments, most any desired arrangement can be provided. Contact Lonestar Prestress Mfg. for any questions about field drilling light poles.
8. INSTALLATION: Lonestar Prestress Mfg. concrete poles are designed for setting directly into the ground, without the use of precast foundations, similar to the setting of wood poles. After the hole is drilled, the pole is set and plumbed, the earth is then backfilled and tamped. The depth is dependent on the nature of the soil and the anticipated load. Where it is impossible to embed the poles in the ground, such as on bridges or overpasses, a boltdown base plate is available.
9. To specify a base plate for base mounted poles add the suffix BP to catalog numbers. Customer to supply the bolt circle drawings or template.

General Information

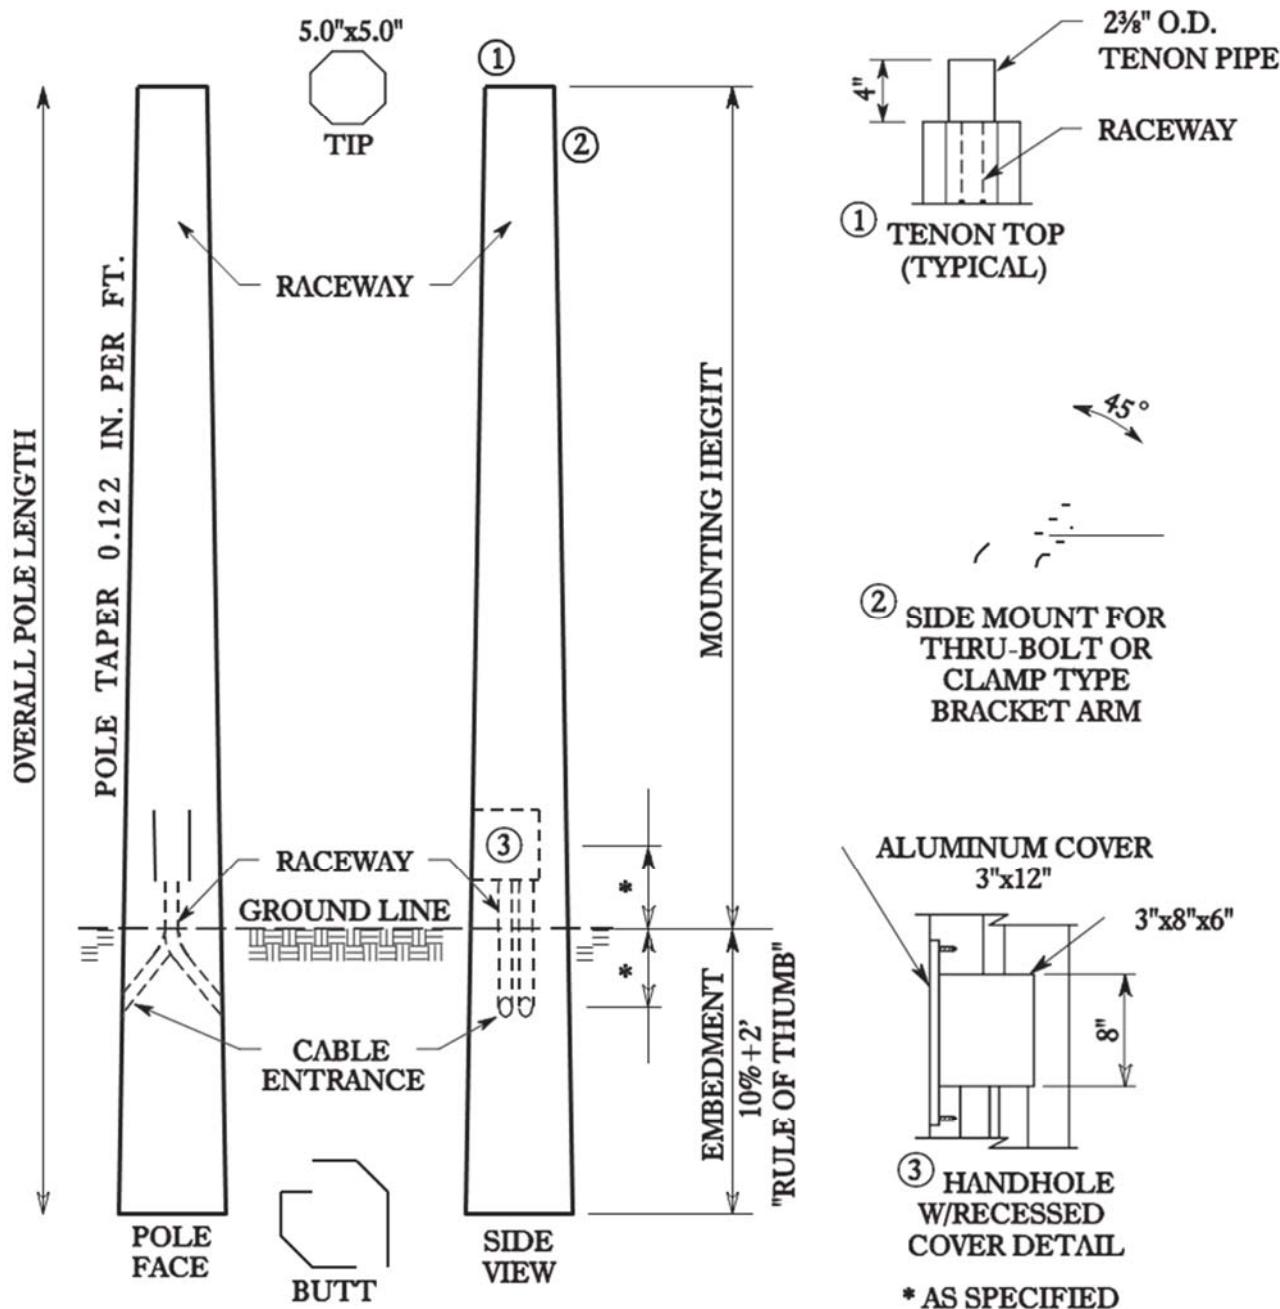

1. Different colors, finishes and exposed aggregates are available upon request.
2. Longer lengths of poles available upon request.
3. All corners are chamfered.
4. 7,000 PSI gray concrete is standard; higher strengths are available if required. The EPA's listed for poles using 7,000 psi concrete shall be reduced by 15% when decorative mixes are used.
5. STRENGTH: In most cases a higher ground line moment and a higher breaking strength and EPA can be attained without going to a larger pole.
6. EFFECTIVE PROJECTED AREA (EPA): Lonestar Prestress Mfg. concrete poles and mounting arms have been designed in accordance with accepted engineering practices to be structurally capable of withstanding wind loads and velocity pressure per ASCE 7-05. Poles to meet higher wind loads are available.
7. HOLES: Holes are precast to meet your specifications and requirements for mounting attachments, most any desired arrangement can be provided. Contact Lonestar Prestress Mfg. for any questions about field drilling light poles.
8. INSTALLATION: Lonestar Prestress Mfg. concrete poles are designed for setting directly into the ground, without the use of precast foundations, similar to the setting of wood poles. Prestressed Concrete Utility Poles

U-1

The Solid Alternative to Wood

Lonestar Prestress Mfg., Inc. concrete poles were developed to meet the expanding need of a supporting structure for street, highway and area lighting, athletic lighting, signs, overhead power distribution, and power transmission, as well as power substations and traffic signals.

50+ Year Service Life

Lonestar prestressed concrete poles are safe for the environment, require no maintenance and have a life of fifty (50) or more years.

High Quality

Every Lonestar pole is an engineered product designed for each specific application and produced under rigid standards of quality.

No Maintenance

Lonestar prestressed concrete poles require no painting, will not rust, are impervious to sunlight (ultraviolet radiation), chemicals (fertilizers, oils, etc.), animals and insects (woodpeckers, termites, etc.) and do not require ground-line treating.

High Strength

Lonestar prestress concrete poles are classified by their ultimate capacity to sustain a horizontal load applied at a point two feet below the tip. Lonestar's concrete is a special high-strength mix design put into compression by prestressed ASTM 416 high strength steel strands.

Many Accessories Offered

Lonestar offers a complete line of brackets, pole caps, pole tensions, and other attachments to allow a complete installation.

Special Modifications

Special needs such as internal grounding, pole steps and cages, floodlight attachments, and other attachments are our specialty. For additional information, or to discuss your special requirements, please contact our sales department.

Accurate Information

The information contained in this catalog is accurate to the best of our knowledge. All products are designed strictly for specific applications. It is the sole responsibility of the buyer to determine the suitability of the products for any other contemplated use. If the products are used for any application other than those specified, Lonestar Prestress Mfg., Inc. will not be liable for any injury or damage arising from their use.

Prestressed Concrete Utility Poles

Engineering Standards: Concrete vs. Wood

Because wood deteriorates over time, the American National Standards Institute (ANSI) and the National Electrical Safety Code (NESC) require wood poles to have an initial load factor 60% greater than equivalent concrete poles.

WOOD POLE EQUIVALENCY

Traditionally, designers have specified wood poles for use as utility structures according to the pole class system set forth in the American National Standards Institutes' specifications ANSI 05.1., *Specifications and Dimensions for Wood Poles*. In order to remain consistent with the pole class system for utility structures, we have developed a wood pole equivalency (WPE) system for our prestressed concrete poles. Our WPE system is based on criteria contained in ANSI 05.1 and the National Electric Safety Code (NESC), ANSI C2.

When establishing WPE criteria, the difference between the two structural systems (materials) must be considered:

WOOD: NESC requires an overload capacity factor (OCF) of 4.0

Wood poles are composed of a naturally grown, biological material, which exhibits inconsistent material properties throughout the length of the pole. These inconsistencies, which have a direct impact on strength, are knots, checks, shakes and splits.

Wood poles are susceptible to rot and decay over the design life of the structure. The wood pole has less strength at the end of its service life than when it was originally placed in service.

Wood poles are susceptible to insect and animal attack. The effects of termite and woodpecker attack can significantly decrease the load carrying capacity of the wood pole well before the end of the anticipated service life.

PRESTRESSED CONCRETE: NESC overload capacity factor (OCF) of 2.5

Prestressed concrete poles are fabricated from engineered materials.

The prestressed concrete poles have consistent material properties throughout their length.

Prestressed concrete poles are not susceptible to rot and decay. The prestressed concrete pole has the same strength throughout its service life.

Prestressed concrete poles are not susceptible to insect and animal attack.

Wood pole classes are determined by the strength required at the groundline to resist a transverse ultimate load placed 2 ft. below the tip of the pole.

Each length of pole within a pole class can resist the same load placed 2 ft. from the top.

When designing pole structures for transverse wind loading, the NESC requires an overload capacity factor (OCF) of 4.0 for wood poles and 2.5 for concrete poles when determining ultimate loads (Grade B construction). Due to the above mentioned differences in the structural systems, the NESC requires the wood pole to have a strength that is 60% higher than the prestressed concrete pole. Therefore, the prestressed concrete pole can be designed for a load that is 62.5% ($2.5/4.0$) of the wood pole load and attain the same strength for the specific pole class throughout the life of the structure.

WOOD POLE EQUIVALENCY EXPLAINED

In order to simplify our WPE system we chose to use the ultimate pole top load that is two load classes lower than the wood pole. For example, ANSI 05.1 lists an ultimate pole top load of 4,500 lbs. for a Class 1 wood pole. Our concrete Class 1-C pole is designed for a 3000 lbs. (Class 3 wood pole load) ultimate pole top load. The ratio of the loads is $3000/4500=0.666$, which is in excess of $2.5/4.0=0.625$ using NESC overload capacity factors for transverse wind.

CONCRETE POLE CLASS LOADS		
CONCRETE POLE CLASS	LOAD 2 FT FROM TIP (LBS)	CONCRETE LOAD WOOD LOAD
H2-C	4,500	0.703
H1-C	3,700	0.685
1-C	3,000	0.666
2-C	2,400	0.649
3-C	1,900	0.633
4-C	1,500	0.625
5-C	1,200	0.632

The above wood pole equivalency system is based on the following assumption:

1. Transverse wind is the controlling design lead.
2. The load acts perpendicular to the face of the pole.

When design configurations involve the use of angle poles and dead end poles where other than transverse winds control the design, our technical staff should be consulted.

Prestressed Concrete Utility Poles

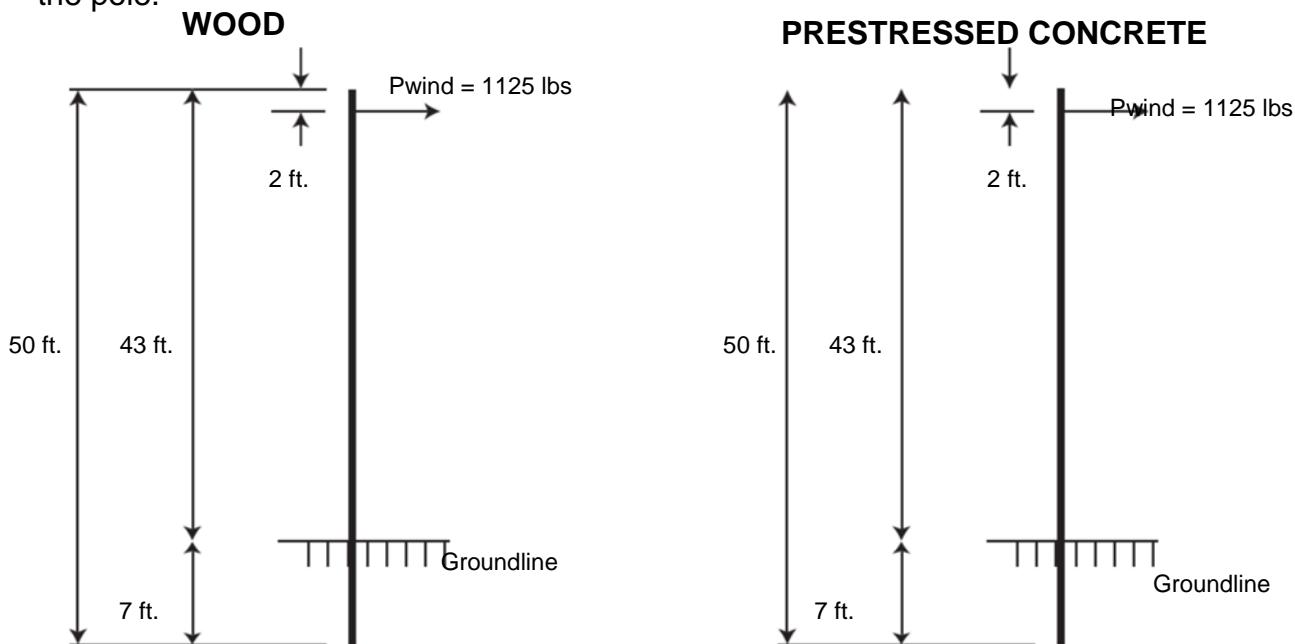

WOOD POLE EQUIVALENCY EXAMPLE

Example:

The following example is for the purpose of demonstrating our WPE system only. In actual design cases, loads other than transverse wind may control and must be investigated.

Assumptions:

- Tangent pole
- Equal conductor spans on both sides of poles
- Transverse wind creates controlling load case for selection of pole
- For simplicity, the wind pressure on the pole is neglected in this example but should be added to the ground line moment for actual design.
- NESI overload capacity factors: 4.0 for wood poles
 2.5 for prestressed concrete poles
- Wind load on conductors produce a resultant load of 1125 lbs., 2 ft down from the top of the pole.

$$P_u = 4.0 \text{ (1125 lbs.)} = 4500 \text{ lbs}$$

For ANSI Class 1 wood pole:

$$P_{max} = 4500 \text{ lbs.}$$

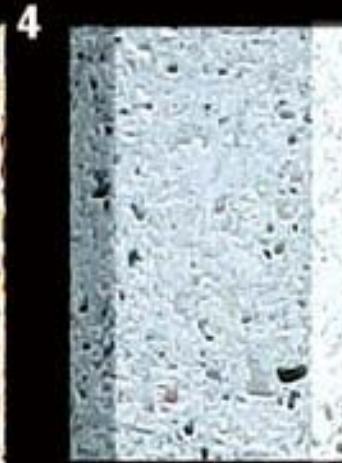

$$P_u = 2.5 \text{ (1125 lbs.)} = 2813 \text{ lbs.}$$

For ANSI Class 1-C prestressed concrete pole:
 $P_{max} = 3000 \text{ lbs. (Class 3 wood pole load)}$

The concrete Class 1-C pole is more than adequate for the transverse wind load. Note the max load of 3000 lbs. for the prestressed concrete pole is the same as for a Class 3 ANSI wood pole.

Standard Pole Finishes

1. The Woodlands—Brown Cement, Brown and Green Exposed Aggregate
2. Natural Gray Concrete
3. First Colony—Buff Cement with Limestone Exposed Aggregate
4. Etched White—White Cement Etched Finish
5. TWB—The Woodlands Black
6. San Jacinto Brown—Brown Cement, Pea Gravel Exposed Aggregate
7. San Jacinto Gray—Gray Cement, Pea Gravel Exposed Aggregate
8. Black and White Terrazzo
9. Pink Granite - not shown, refer to pole finish brochure.
