Innovative Approach to Medicine

Introducing

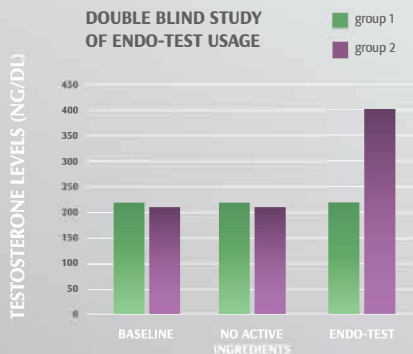

ENDO-TEST

Using peptide specific signaling technology, AQ Endo-Test provides a hormone-free product to help boost endogenous free testosterone. Endogenous free testosterone is testosterone that travels freely in the blood and interacts with biological compounds in the body to promote anabolic (building) effects. Endo-test is applied topically and absorbed into the skin. From there the peptides active pituitary, adrenal, and gonadal glands to normalize, restore, and enhance endogenous testosterone production.

**PEPTIDE SPECIFIC
SIGNALING
TECHNOLOGY**

**DOUBLE BLIND STUDY
OF ENDO-TEST USAGE**

**96 male participants during a 3 month study.*

Why is Testosterone Important?

Testosterone is a hormone derived from cholesterol that promotes muscle building, increased bone density, and increased red blood cell production, as well as playing a role in male sex hormone functionality. Due to normal aging as well as certain diseases, testosterone levels can be found to be below normal. This can result in fat gain, bone mass loss, depression, fatigue, loss of libido, and erectile dysfunction.

AQ Therapeutics was pioneered following breakthrough research on human growth factors. Follow AQ Therapeutics to witness us expose progressive scientific evidence validating the versatile, therapeutic potential of growth factors.
