

# how to care for your stone

## granite

- Granite is antibacterial, so only soap and water is needed to clean. Do not use any abrasive cleaners, such as bleach or ammonia, as it will remove your seal.

- Reseal every 3-5 years. This is something we can do for you, or you can buy a kit at a hardware store.

- Some granites contain natural limestone or quartz, which can be eaten away by strong acids, such as citrus juices and vinegar. Make sure to not leave these sitting on your countertops.

- Granite is entirely heat-resistant, so you are safe to go straight from stove to counter.

## quartz

- Only soap and water is needed to clean to Quartz. Do not use any abrasive cleaners, such as bleach or ammonia, as it will remove the shine.

- Quartz does not need to be resealed.

- Metal knives and heavy utensils can scratch Quartz, so make sure to never cut directly on the countertop surface.

- Wipe up juice, coffee, wine, and other spills immediately to not stain your countertop.

- We do not recommend any heat that you cannot touch with your hands on your countertops. Quartz will burn past 325 degrees.
