The Woundcur® Gel and Barrier Cream combination is a safe and easy to apply Two-Step protocol that optimizes Wound Healing for Irritated Skin*

Safe and Effective Plant Based Healing for Sensitive Skin

Wound healing in adult skin, a complex process involving many cell types and processes such as epidermal, fibroblastic and endothelial cell proliferation, cell migration, matrix synthesis and wound contraction, almost invariably results in scar tissue formation and wound induration in adult skin.

Woundcur® Gel and Barrier Cream contain a proprietary preparation derived from Curcumin extract and other plant-based ingredients that provide a potent inhibitor of inflammation and scarring, as well as protection from re-injury of the wound. The gel dressing may be used as a topical agent combined with approved dressings for wound healing for ulcers, burns and surgical wounds.

Woundcur Topical Two Step Protocol for Compromised Skin

This two step protocol employs both an active hydrogel to rehydrate and soothe, and active barrier cream to promote moisture retention and protection from further injury. Dispense one full pump of WoundCur Gel to coat affected area and massage into skin until dry. Apply one or two pumps of WoundCur Barrier Cream on top of the gel layer for optimal barrier repair and calming benefits. Use as often as needed, or until affected area is improved. Woundcur Topical Two Step Protocol may be used adjunctively with other topical therapies for overall skin health.
