

**Official: NutrioChemical & UnMagnified Thermo Macro Wholistic Therapies towards
Exogenous and Endogenous Molecular Pathogen Control of Interior Viruses,
of Live Grown Solanaceous Crops**

'Musgo Lynx'; Diplomat, United States of America

As discovered, through Endeavors, with the *United States Department(s) of Agriculture & Homeland Security*, such has just recently been Verified and Replicated, by the *Central Intelligence Agency*, as of April 2026: Consistent Temperature(s) of **110 to 120 degrees, for 4 hours or more,** per day, with *'normalized conditions'* for greenhouse growth, for night and day, at other times, with weekly applications of soil drenched **10-30-10 fertilizer**, followed with **excellent cultural control**, then having or not having, **meristem tipping, removes all pathogenic Viruses, of Tomatoes, Potatoes, and Eggplants, above the roots, and in all Edible Parts.**

What has been traditionally, been completed through thermotherapy of explants, in lab conditions, is possible with full grown live plants and crops, in Greenhouse and C.E.A. conditions, with new experiments, currently being tested in Semi-Tropical Outdoor 'Field' Environments. **Hot Temperatures, with Adequate Condition, Semi High in Phosphorous, and Moderate with Nitrogen and Potassium, with Balanced Trace Elements, has Shown to Repeatedly Remove, Viral Pathogens of these above crops, both at growth, and when followed by Tissue Culture, as well.** Such may have presented, a reason to eliminate this last step, in mass plant and real World Situations, of situational agronomy, while also being extensively adaptable to other Vegetables, and Fruits, as well as Trees, that can Show Survival, in these Conditions; Such is being explored on other horticulture crops currently.

This **'Whole-Environment Concept'**, helps to expedite and endeavor a new era of Crops Health Control, that is not as Chemically, Labor, or Molecularly Intensive, as traditional thought processes.
