## **Ant Treatment Preparation**

- **Option 1 (most effective): Spray Interior**

We will be spraying baseboards around the entire home and around door jambs. We will spray whatever is accessible and will not be moving any tenant belongings. Furniture and bulky items do not need to be moved.

**People and pets should stay out for 2 hours or until the product dries.  
Fish tanks can be covered with a towel.**

- **Option 2 (may void warranty): Spot Treat/Bait Interior**

**No birds in or around treatment.**

We typically bait in areas ants are found, such as kitchens, bathrooms, or near doors. We will only be baiting areas that have current activity. When baiting we try to place bait in areas away from animals and kids so that the bait will not be disturbed. Ant gel bait is chemically designed for ants. The toxicity is low. The bait lasts 30 days; please leave the bait out for ants to consume. Bait needs to be removed after 30 days by the client.

**Please do the following things to have the most successful ant treatment:**

- Clean off counters in the kitchen and move clutter away from baseboards.
- The exterior needs to be free and clear of items. We will be applying treatment 1 foot up and 1 foot out around the foundation perimeter.

**Pets will need to be away from the treated area during treatment and afterwards until dry.**
