

## Ant Treatment Preparation

### **Option 1 (most effective): Spray Interior**

Spraying baseboards around entire home and around door jams.

We will spray whatever is accessible and will not be moving any furniture or any other tenant belongings.

- **Absolutely no birds in house during treatment.**
- **Other animals, infants and elderly with health issues need to be away during treatment and afterwards until baseboards dry. Fish bowl can be covered with towel.**
- **Children and adults can stay but must not come in contact with wet areas.**

### **Option 2 (when option 1 is not convenient): Bait Interior**

We typically bait in areas ants are found, such as kitchens, bathrooms, or near doors. We will only be baiting areas that are having current activity.

When baiting we try and place bait in areas away from animals and kids so that the bait will not be disturbed. Ant gel bait is chemically designed for ants. The toxicity is very minimal. The bait lasts 30 days; please leave the bait out for ants to consume. Bait needs to be removed after 30 days by client.

**Please do the following things to have the most successful ant treatment:**

- **Clean off counters in the kitchen**
- **Exterior needs to be free and clear of items. We will be applying treatment 1 foot up and 1 foot out around foundation. **Pets will need to be away from treated area during treatment and afterwards until dry.****
