

Landslide Kit

The Landslide kit is designed for those soils that need to be reduced by water instead of air to facilitate removal by the vacuum. The specially designed jets are incorporated into the tip and are capable of introducing water or air to help break up the soils or other materials to be vacuumed. The discharge from the jets is controlled by a trigger on the handle. The design of the Landslide kit allows for 1 person operation. The ability to add extensions make this tool ideal for creating inspection holes to check void spaces created by landslides, snow avalanches, etc.

The Landslide kit includes 48" vacuum with wand with tip, two 48" extensions, 10' of 8" hose, Rescue Vac Relief valve, 8" to 4" reducer, and 2 - 25' of 4" hose.
