

Rescue Mud Knife

The RescueVac Rescue Mud Knife is specifically designed to be used in incidents such as mud slides, catch basins incidents, water main breaks, etc. where the victim becomes engulfed in water saturated material. Such types of rescues are difficult as the wet material creates a “suction” requiring removal of a large amount of material until the victim can be rescued.

The use of the Rescue Mud Knife breaks that “suction” force around the victim allowing for a rapid removal of the victim with a minimal amount of material removal required.

The design of the Rescue Mud Knife allows for operation with air only at 100 cfm @ 90-100 psi or an air/water combination using 100 cfm of air and 5 gpm of water.

The Rescue Mud Knife comes with control handle, 48” main with tip and 48” extension.

An air/water control unit allowing for single line deployment is available separately.
