

Virtual CISO Services

Pentamix Security

Engage our vCISO services with an experienced cybersecurity executive providing your business the most cutting edge protections across today's evolving technologies.

Provide your business with oversight and direction to help you make smart security decisions to position you for future growth while keeping you safe from current threats. We analyze your business requirements, identify, and mitigate threats and develop an actionable plan that can move your security posture forward as you focus on your business growth.

Today's Cyber Threat Landscape is more sophisticated than ever. Data Breaches, Ransomware, Credential Theft, and Mobile Exploitations are happening faster than Security Teams are able to defend.

Our vCISOs are working with vendors that are focused on data protections across the most cutting edge technologies for Data Security, ZTNA (Zero Trust Network Access), SSE (Secure Service Edge), API Protections and Secure Software Supply Chain!

Baseline Review

Evaluating the maturity, risk, or readiness of the current security program to determine existing strengths and gaps remains one of our first recommended steps. This gives you a starting point to ensure you are spending your resources on the things that will give you the best impact.

Roadmap and Strategy

Many vCISO offerings will complete a baseline and provide a 200-page document and leave you to determine how to fix gaps that were identified.

We help you understand the risks identified, build a roadmap to prioritize those efforts, a strategy to integrate cyber into your business, and outline forecasts or resources needed for ongoing efforts aligned to your financial goals and risk tolerance.

Ongoing Support

Our primary goal for any of our services is to help your cyber security program keep your business secure so you can focus on business growth and objectives. Based on our understanding of your risk tolerance and capacity, we can provide ongoing support which could include project support for security initiatives, working with your internal IT teams to ensure the roadmap is progressing as planned, board readouts on progress, and much more.
