

F5 TMSH Reference - 14.x

F5 TMSH references are collections of the available BIG-IP TMSH man pages.

General

grep

NAME
grep - Display lines matching a pattern

SYNTAX
list [component] "|" grep [[option | pattern] ...]
show [component] "|" grep [[option | pattern] ...]
options:
-A [integer]
-B [integer]
-C [integer]
-E
-G
-P
-c
-e [pattern]
-i
-m [integer]
-n
-o
-v
-w
-x Note: Each option must be followed by a space.

Note: tmsh treats any argument that is not preceded by a supported option, and does not begin with a hyphen, as a search pattern preceded by -e.

DESCRIPTION
You can use grep to filter the output generated by the commands list (configuration settings) and show (statistics and runtime status). You must type the character | before the grep specification. You can use multiple filters chained together.

EXAMPLES
The following examples show how to use the grep utility in tmsh.

```
list ltm node | grep "^10\.2"  
list ltm virtual | grep -i seattle  
list ltm virtual | grep -i abc | grep -i ab | grep -i a
```

OPTIONS
-A Display the specified number of lines of context after matching lines.
-B Display the specified number of lines of context before matching lines.
-C Display the specified number of lines of context before and after matching lines.
-E Interpret patterns as extended regular expressions.
-G Interpret patterns as basic regular expressions.
-P Interpret patterns as Perl regular expressions.
-c Display a count of the lines that match. If -v is specified the number of non-matching lines is displayed.
-e Specify a pattern. This is useful to protect against patterns beginning with a hyphen.
-i Case insensitive search.
-m Stop reading input after the specified number of matching lines. If -c is specified the count will not exceed the value specified for -m. If -v is specified grep will stop after finding the specified number of non-matching lines.
-n Prefix each line of output with the line number relative to the input.
-o Show only the part of a matching line that matches the pattern.
-v Invert the sense of matching, to select non-matching lines.
-w Select only those lines containing matches that form whole words. The test is that the matching substring must either be at

the beginning of the line, or preceded by a non-word constituent character. Similarly, it must be either at the end of the line or followed by a non-word constituent character. Word-constituent characters are letters, digits, and the underscore.

-x Select only those matches that exactly match the whole line.

BIG-IP 2017-05-24 grep(1)

time

NAME

Time - Date and Time formats.

MODULE

All tmsh modules.

SYNTAX

Date/Time Syntax

```
now[ [ + | - ] [ d | h | w | m ] ]
yyyy-mm-dd[ : | T ]hh:mm[:ss]
mm-dd[-yyyy][ : | T ]hh:mm[:ss]
mm/dd[/yyyy][ : | T ]hh:mm[:ss]
```

Date Range Syntax

```
now[ [ + | - ] [ d | h | w | m ] ]--now[ [ + | - ] [ d | h | w | m ] ]
yyyy-mm-dd[ : | T ]hh:mm[:ss]--yyyy-mm-dd[ : | T ]hh:mm[:ss]
mm-dd[-yyyy][ : | T ]hh:mm[:ss]--indefinite
epoch--mm/dd[/yyyy][ : | T ]hh:mm[:ss]
now[ [ + | - ] [ d | h | w | m ] ]
```

DESCRIPTION

The date or time format is found in tmsh as an attribute or parameter for many configuration items. Below are the various formats supported for both Date/Time and Date Range. Please see the examples for further assistance in using the required formats.

DATE:TIME FORMATS

nowX This date format starts with now (the current time) and is optionally followed by + or - some time span. The format will look like the following: now[[+ | -] integer [d | h | w | m]], where the user picks either before (-) or after (+) the current time and then specifies integer number of minutes(m), hours(h), days(d) or weeks(w). This format is case-insensitive.

Examples:

Input Date	Description
------------	-------------

now-3d	3 days ago.
now+3h	3 hours from now.
now-3m	3 minutes ago.
now+3w	3 weeks from now.

yyyy-mm-dd:hh:mm:ss

This format requires a year, month, day separated by - characters. A time is also required, which is specified as hour:minute:second, where the seconds are optional. The date and time must be separated by a : colon. Note: This is the default time format for output from tmsh.

Examples:

Input Date	Description
------------	-------------

2013-05-29:13:30	May 29th, 2013 at 1:30pm.
2000-01-04:12:22:30	January 4th, 2000 at 12:22pm and 30 seconds.

mm-dd-yyyy:hh:mm:ss

This format requires at least a month(m) and day(d) specified and optionally a year (y). If no year is specified, tmsh will auto-fill the year with the current year. A time is also required in the format of hour:minute:second, where the seconds are optional.

Examples:

Input Date	Description
------------	-------------

3-12-2015:12:01:00	March 12th, 2015 at 12:01 pm.
4-15:22:10:30	April 15th of this year at 10:10 pm and 30 seconds.

mm/dd/yyyy:hh:mm:ss

This format requires at least a month(m) and day(d) specified and optionally a year (y). If no year is specified, tmsh will auto-fill the year with the current year. A time is also required in the format of hour:minute:second, where the seconds are optional.

Examples:

Input Date	Description
3/12/2015:12:01:00	March 12th, 2015 at 12:01 pm.
4/15:22:10:30	April 15th of this year at 10:10 pm and 30 seconds.

T Delimiter

Any of the above time formats may optionally use a capital letter T (as in the word Time) to separate the date from the time, instead of using a colon (:).

Examples:

Input Date	Description
9/16/2005T12:01:01	September 16th, 2005 at 12:01pm and 1 second.
2011-11-12T00:03:30	November 12th, 2011 at 12:03am and 30 seconds.

Special Dates

There are two special dates that may be used in tmsh. They are indefinite and epoch. Below is an explanation of those dates.

indefinite

The date will be marked as being infinitely in the future (end of time).

epoch

The date will be marked as being infinitely in the past (beginning of time).

DATE RANGES

DateX--DateZ

A Date Range is 2 dates in a valid Date Format separated by a -- (double hyphen). The dates may be any of the Date Formats specified above. See examples below on how to use this notation.

Examples:

Input Date	Description
now-2d--now-4d	2 to 4 days ago.
now--now-3m	From 3 minutes ago to now.
epoch--3/12/2011:12:00:00	Everything older than March 12th, 2011 at noon.
2008-03-12--indefinite	Everything after midnight on March 12th, 2008.

DateX

When specifying a date range, the second date may be left out. This will cause the system to assume the second date in the range to be now. Using this format for a date range may make it confusing when using the NowX date format listed above. The following examples will help clarify how to use this format with any supported Date Format.

Examples:

Input Date	Description
now-3d	From 3 days ago to now.
now+3w	From now to 3 weeks from now.
epoch	Everything before the current date and time.
indefinite	Everything after the current date and time.

tmsh

NAME

tmsh - Traffic Management Shell - A command line interface for managing the BIG-IP(r) system.

DESCRIPTION

You can use tmsh to configure and manage the BIG-IP system in conjunction with the Configuration utility, which is the browser-based BIG-IP system and network management tool.

MODULES

The structure of tmsh is hierarchical and modular. The highest level is the root module, which contains subordinate modules: auth, cli, gtm, ltm, net, sys and wom. Use the command help with no arguments to display the module hierarchy relative to the current module.

The gtm, ltm, net, sys, and wom modules also contain subordinate modules. All modules and subordinate modules contain components. To display the list of modules and components that are available in the current module type Tab or ? at the tmsh prompt.

Commands operate on components. To display the list of available commands type Tab or ? at the beginning of the command line. To display a list of components on which a command can operate type the command followed by a space followed by Tab or ?.

The following examples illustrate how to navigate the tmsh hierarchy.

To enter a module, type the name of the module at the tmsh prompt.

```
(tmsh)# ltm
```

The prompt displays the current module location.

```
(tmsh.ltm)#
```

You can display the components in a module using the commands list (configuration) and show (statistics and runtime status). The following command sequence displays the virtual server configuration of the BIG-IP system.

```
(tmsh.ltm)# list virtual
```

In the following examples, the commands list and show display information about only ltm components.

```
(tmsh.ltm)# list
(tmsh.ltm)# show
```

You can access any component in any module from any other module by specifying a complete path to the component. For example, from the ltm module, the following command displays all of the properties of the VLANs on the system. The forward slash / specifies that what follows is relative to the root module.

```
(tmsh.ltm)# list /net vlan all-properties
```

The forward slash is optional if the root module is the current module. For example, the following command sequences display profiles.

```
(tmsh)# list ltm profile
(tmsh)# list /ltm profile
(tmsh)# list / ltm profile
```

Most components also support component mode. You can navigate to a single component and run commands to manage that component. For example, from the ltm module, to navigate to the node component, use the following command.

```
(tmsh.ltm)# node
```

To display the properties of all nodes, use the following command.

```
(tmsh.ltm.node)# list
```

You can also navigate to a specific object (object mode). For example, from the node component, to enter object mode for a specific node, enter the command modify followed by the IP address of the node.

```
(tmsh.ltm.node)# modify 10.1.1.10
```

In object mode, you can configure property settings directly. For example, to set the connection limit for 10.1.1.10 to 10000, use the following command.

```
(tmsh.ltm.node.10.1.1.10)# connection-limit 10000
```

To exit a module enter the command exit at the tmsh prompt, as shown below.

```
(tmsh.ltm)# exit
(tmsh)#
```

PRODUCT PROVISIONING

You must provision a BIG-IP system module before you can use tmsh to configure that product, for example, the Global Traffic Manager. The command sequence list sys provision displays the BIG-IP system modules that can be provisioned. For more information about provisioning, see the TMOS(r) Management Guide for BIG-IP Systems and help sys provision.

LOADING/SAVING THE SYSTEM CONFIGURATION

The system applies all configuration changes that you make from within tmsh to the running configuration of the system.

You can save a portion of the running configuration known as the base configuration. You can also load the base configuration from the stored configuration files.

To save the base configuration to the stored configuration files, use the command sequence: save sys base-config.
To replace the running base configuration with the configuration in the stored configuration files, use the command sequence: load /sys base-config.

Additionally, you can save the entire running configuration or load all

of the stored configuration files.

To save the entire running configuration to the stored configuration files, use the command sequence: `save /sys config`.
To replace the entire running configuration with the configuration in the stored configuration files using the command sequence: `load /sys config`.

HELP

tmsh includes man pages for each of the commands and components that are available within tmsh. You access the man pages using the following command syntax: `help [[command] | [full path to component]]`.

For example, to access the man page for the vlan component from the root module, use this command sequence: `help / net vlan`.

You can also search the man pages for information on a specific topic. To do this you use the command syntax: `help search [topic]`. You can perform a help search from within any module in the tmsh hierarchy. For example, to find the man pages that contain a reference to VLANs, use this command sequence: `help search vlan`

To display a list of topics that are available in a module use this command sequence: `help [full path to module]`.

For example, to display the topics that are available in the current module use this command: `help`. To display the topics that are available in the net module use this command sequence: `help / net`.

CONTEXT-SENSITIVE HELP

tmsh includes a context-sensitive help feature that provides help as you type commands. At any time, you can type a question mark (?) on the command line, and tmsh returns information to assist you in completing the command. Based on when you type the question mark, you get the following results.

When you type a question mark immediately following any portion of a command, tmsh returns possible completions for the command, but does not complete the command as the command completion feature does. When you type a space before the question mark, tmsh returns descriptive text that explains the commands, components, or properties that you can configure. When you type a question mark in the middle of a command, tmsh returns help on the command to the left of the cursor.

Note: To use a question mark in a Glob or regular expression, you must escape the question mark using quotation marks, apostrophes, or a backslash.

Additionally, you can request context-sensitive help for the last command in a series of commands. For more information, see ENTERING MULTIPLE COMMANDS, following.

COMMAND COMPLETION

At any point while typing or editing a command in tmsh, you can press the Tab key. tmsh either completes the current or next word, or displays possible completions for the current or next word. If tmsh displays nothing after you press the Tab key, no options exist to complete the word. If you move the cursor anywhere on the command line and press the Tab key, tmsh completes what is to the left of the cursor.

Command completion also reduces the amount of typing that is required to run commands. When you press the Tab key, the system automatically completes the current command-line element to as many unique characters as possible. If there is more than one possible completion the list of possible completions displays. Command completion also completes configuration object identifiers.

ENTERING MULTIPLE COMMANDS

You can enter multiple commands on the command line by separating the commands with semi-colons (;). For example, to display the properties of the self IP addresses and VLANs of the system, use this command sequence:

```
list / net self ; list / net vlan
```

When you enter multiple commands in this way, all of the commands are added to the command history in a single line item, regardless of whether any of the commands were successful. However, if one of the commands that you enter fails to parse, tmsh does not run the remaining commands you entered. tmsh audits commands as the commands run; therefore, if a command fails to parse, tmsh does not audit the remaining commands. For more information about the command history, see COMMAND HISTORY, following.

You can also specify multiple commands in a command alias by separating the commands with semi-colons. For example, to create an alias that displays the properties of the VLANs and VLAN groups on the system, use this command sequence:

```
create / cli alias vlans command "list / net vlan ; list / net vlan-group"
```

You can request context-sensitive help and utilize the command completion feature on the last command in a series of commands. For example, the following command sequence displays help for the vlan-group component.

```
list / net vlan ; list / net vlan-group ?
```

COMMAND HISTORY

tmsh saves in the command history file each command that you enter. The command history persists when you log off of the system. The next time

you log on to the system, you can search for, display, and then edit, the tmsh commands that you entered in previous sessions. The command history persists even through a restart of the BIG-IP system. For more information about the command history feature, see help history.

The following examples show how to use the command history feature.

To display the commands in the history list, enter either the command sequence show history or an exclamation point (!). tmsh displays a list of commands each preceded by a numeric ID.

To run a command from the history list, enter an exclamation point followed by the numeric ID of the command.

To run the previous command, enter !!.

FILTERING OUTPUT

You can filter the output generated by the commands list (configuration settings) and show (statistics and runtime status) using the UNIX grep utility. You must type the character | before the grep specification. You can use multiple filters chained together. For a list of supported grep options, see the Traffic Management Shell (tmsh) Reference Guide.

The following examples show how to use the grep utility in tmsh.

```
list ltm node | grep "^10\.2"
list ltm virtual | grep -i seattle
list ltm virtual | grep -i abc | grep -i ab | grep -i a
```

KEYBOARD BINDINGS

tmsh supports vi, emacs and default keyboard bindings. You can set the binding using the keymap preference. For more information, see help cli preference. For a detailed description of the default mapping, see the Traffic Management Shell (tmsh) Reference Guide.

Note that all mappings provide command-line editing and the capability to search the command history.

WILDCARD OBJECT IDENTIFIERS

You can specify configuration object identifiers using glob and regular expression syntax.

For glob and regular expression syntax rules, see help glob and help regex. Note that you can escape the glob and regular expression special characters using a back slash.

The following examples show how to use glob and regular expressions in tmsh.

Uses a glob expression to display the configuration of all nodes that begin with 10.1..

```
list ltm node 10.1.*
```

Uses a regular expression to display the configuration of all nodes that begin with 10. and contain .44.. Note that a regular expression must begin with an @ symbol. This identifies to tmsh that the identifier should be treated as a regular expression and not a glob or standard object identifier. The leading @ is not part of the regular expression.

```
list ltm node @^10\..*\.44\.
```

PREFERENCES

You can customize the behavior of tmsh. For more information, see help cli preference.

FILES

tmsh manages several files in a user's home directory.

\$HOME/.tmsh-history- contains command history.

STATISTICS

You can use tmsh to display statistics, including historical performance statistics. You can select the format in which the statistics display, as well as reset the statistics for some of the tmsh components. To determine if statistics are available for a component, see the man page for the specific component.

The following examples show how to display and reset statistics for the net interface component from the root module.

```
show net interface
reset-stats net interface
```

The following examples show how to display and reset statistics for the net interface component from the net module.

```
show interface
reset-stats interface
```

AUTOMATING TMSH

You can use tmsh to build TCL scripts to automate management of the BIG-IP. See the cli script help page.

COMMAND LINE OPTIONS

The following options can be specified when tmsh is started from the system shell.

-a tmsh does not write commands to the command history file.

Note that if auditing is enabled, tmsh continues to write commands to the audit log. This option is useful when writing scripts from the system shell, because it stops the scripts from filling up the

command history file. This option applies to the non-interactive mode only.

-c Run the specified command. A command that contains multiple arguments must be in quotes. No other options may be specified after -c

-d [ip address | host name]
Connects to the specified blade in a clustered system.

-e Disables video highlighting in tmsh.

-h Displays options you can use when accessing tmsh from the system shell.

-m Generates a tmsh debug log named tmsh.out in the current directory.

Note that when you run a tmsh script, the shell generates a debug log file for the script named tmsh.out.[script name].

Using this option causes tmsh to run significantly slower.

-q Prevents tmsh from responding to user actions with questions. This option is useful when writing non-interactive shell scripts from the system shell.

-r
This option allows the user to run TMSH the specified version. This is used to provide backwards compatibility for older TMSH syntax only. The version must be specified in the format maj.min.pt, for example 11.5.0

SEE ALSO

Detailed information on the following topics is available through the help command: cli preference, cli script, glob, help, regex, and sys provision.

For complete information about tmsh, see the Traffic Management Shell (tmsh) Reference Guide. This guide is available on the AskF5(sm) Knowledge Base ().

Commands

cd

NAME
cd command - Change the current working folder.

MODULE
All tmsh modules.

SYNTAX
Use the command cd to change the current working folder.

```
cd [folder name]
cd /[folder name]
```

DESCRIPTION
The command cd [folder name] changes the current working folder to allow the user navigation around the folder system (see sys folder). The command pwd displays the current working directory.

The current working folder may be listed in the tmos command prompt while in tmsh interactive mode (see cli preference).

Folder names are separated by a forward slash /.

There are two built-in folders:

/ is the root folder

/Common is the default folder for creating new configurations objects.

Additionally, the following directory entries:

. is the current folder
.. is the parent folder

EXAMPLES

```
cd /Common
```

Change the current working folder to /Common.

```
cd resources
```

Change the current working folder to resources. In this example the resources folder is relative to the current working folder. As an example, if the current working folder was /Common, the new working folder will be /Common/resources.

```
cd resources/profiles/udp
```

Multiple folders may be specified. Tab complete assists filling the command line with folder names.

```
cd /
```

Make the current working folder the root folder.

```
cd ../Alpha
```

Change the working directory by first going to the parent, and then switch to the sub-folder Alpha.

cp

NAME

cp command - Creates a copy of a TMOS(tm) configuration object.

MODULE

All tmsh modules.

SYNTAX

Use the command cp within a tmsh module to create a copy of the component that resides in that module. To create a copy component that resides in another module, use the full path to the component.

```
cp [component] [source] [destination]
cp / [module...module] [component] [source] [destination]
```

DESCRIPTION

You must provide a unique name for each component destination of the copy operation.

EXAMPLES

```
cp template mytemplate newtemplate
```

From within the sys application module, creates a new Application Template named newtemplate with the same properties as mytemplate .

```
cp / cli script my_script1 my_script2
```

From within the sys application module, copies the my_script1 script to my_script2 within the cli module.

OPTIONS

component

Specifies the type of the component that you want to copy.

module

Specifies the module within which the component that you want to copy resides.

source

Specifies the component to be copied.

destination

Specifies a unique name for the component that will be created as part of the copy.

SEE ALSO
tmsh

COPYRIGHT

BIG-IP 2010-12-06 cp(1)

create

NAME
create command - Creates a TMOS(tm) configuration component.

MODULE
All tmsh modules.

SYNTAX
Use the command create within a tmsh module to create a component that resides in that module. To create a component that resides in another module, use the full path to the component.

```
create [component] [name] [property [value]...]
create / [module...module] [component] [name] [property [value]...]
```

DESCRIPTION
You must provide a unique name for each component that you create.

EXAMPLES
create pool pool1

From within the gtm module, creates a Global Traffic Manager pool named pool1.

create / ltm pool my_pool

From within the gtm module, creates a Local Traffic Manager pool named my_pool.

OPTIONS
component
Specifies the type of the component that you want to create.

module
Specifies the module within which the component that you want to create resides.

name Specifies a unique name for the component.

property [value]...
Specifies properties for the component and their values.

SEE ALSO

BIG-IP 2016-03-14 create(1)

delete

NAME
delete command - Deletes a tmsh component.

MODULE

All tmsh modules.

SYNTAX

Use the command delete within a tmsh module to delete a component that resides in that module. To delete a component that resides in another module, use the full path to the component.

```
delete [component] [name]
delete / [module...module] [component] [name]
```

DESCRIPTION

You must provide the name of the component that you want to delete.

EXAMPLES

```
delete pool pool1
```

From within the gtm module, deletes the Global Traffic Manager pool named pool1.

```
delete / ltm pool my_pool
```

From within the gtm module, deletes the Local Traffic Manager pool named my_pool.

OPTIONS

component

Specifies the type of the component that you want to delete.

module

Specifies the module within which the component that you want to delete resides.

name Specifies the name of the component that you want to delete. All may be used as an identifier for most component types.

recursive

Deletes all items in the current folder and all sub-folders that match the module, component and the name specified. all may be used as the name identifier with this command.

Note: When using recursive and all together, you will be prompted to verify this action. If you wish to disable this prompt, you may run tmsh using the -q command-line option. This is very useful when writing scripts that use this command.

SEE ALSO

BIG-IP 2016-03-14 delete(1)

edit

NAME

edit command - Opens the specified components in an editor.

MODULES

All tmsh modules.

SYNTAX

Use the command edit to create components or modify the configuration of components using a text editor. To edit a component that resides in another module, use the full path to the component.

```
edit [component] [name ... name | all]
edit / [module...module] [component] [name ... name | all]
```

DESCRIPTION

You can use the command edit to create or modify components in the auth, cli, gtm, ltm, net, sys and wom modules, and iRules(r).

If you are assigned the role of Administrator, when you use the command edit, the system starts the vi editor. If you are assigned any other role, the system starts the pico/nano editor.

The system saves, in a temporary directory, the text file, named data, that you are editing. When you save the file and close the editor, the system checks for errors, and then prompts you with an opportunity to continue editing and resolve any errors.

When you edit an existing component that can have associations, such as a Global Traffic Manager wide IP that can have pool member

associations. but the component does not currently have associations, to create the new associations, you must use the full command syntax in the text file. For the full command syntax for each component, see the associated man page.

When you edit a component that has associations with components that are children of the component you are editing, the text file contains a line for the configuration of the child components that begins with the command modify, for example: pools modify { [existing pool members configurations] }. In this case, if you want to add or delete pool members, you must add additional lines to the text file, for example: pools delete { [pool members to delete] }.

If you want the text file that opens to contain all of the editable properties of the component that you want to edit, you must use the all-properties option at the end of the edit command sequence; otherwise, only the non-default properties display in the text file.

EXAMPLES

```
edit / gtm pool a*
```

From the root module, opens a file in an editor in which you can modify the configuration of all Global Traffic Manager pools with names that start with the letter a using the template that displays in the editor.

```
edit datacenter new_dc
```

From the gtm module, opens a file in an editor in which you can create the Data Center named new_dc using the template that displays in the editor.

```
edit datacenter a*
```

From the gtm module, opens a file in an editor in which you can edit all existing datacenters with names that begin with the letter a.

```
edit datacenter new_datacenter existing_datacenter
```

From the gtm module, opens a file in an editor in which you can create a new datacenter and edit an existing datacenter. Note that when the file opens, a template displays that you can use to create a new datacenter followed by the configuration of the existing datacenter.

```
edit rule rule_1
```

From the gtm module, opens a file in an editor in which you can create an iRule named rule_1 using the template that displays in the editor.

When the editor opens, and you are creating or editing an iRule, you must enclose the iRule syntax in brackets, for example, [...iRule...]. Note that the template includes the brackets.

OPTIONS

all Specifies that you want to modify all of the existing components of the specified type.

component

Specifies the type of component that you want to create or modify.

module

Specifies the module within which the component resides.

name Specifies a unique name of each component that you want to create or modify.

exit

NAME

exit command - Exits a tmsh module or component.

MODULE

All tmsh modules.

SYNTAX

Use the command exit within a tmsh module or component to leave that module or component and return to the higher level of the shell

structure.

exit

Note that to exit tmsh and return to the BIG-IP(r) system prompt, use the command quit.

DESCRIPTION

For more information about the structure of tmsh, see the Traffic Management Shell (tmsh) Reference Guide.

SEE ALSO

tmsh

COPYRIGHT

BIG-IP 2012-04-05 exit(1)

generate

NAME

generate - Generate signed scripts using different algorithms for components (for example, iRules).

MODULE

All tmsh modules.

DESCRIPTION

Use the generate command to generate signed scripts for components. Currently two algorithms are supported: checksum and signature.

generate checksum
generate signature signing-key

SEE ALSO

ltm rule, sys application template

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-04-08 generate(1)

help

NAME

help command - Displays context-sensitive help text.

MODULE

All tmsh modules.

SYNTAX

Use the command help within a tmsh module to display information about the components that reside within that module, or at the component level to display help about the component. To display help for a component that resides in one module from within another module, use the full path to the component.

Type the question mark (?) character anywhere in tmsh to display a list of modules, components, and commands that are available within the module in which you are currently working.

?
help
help [module...module]
help [component]

help / [module...module] [component]
help search [text]

DESCRIPTION

You can display tmsh man pages using the command help.

EXAMPLES

?

From within the gtm module, displays a list of modules, components, and commands that are available.

help pool

From within the gtm module, displays help about Global Traffic Manager pools.

help / ltm pool

From within the gtm module, displays help about Local Traffic Manager pools.

OPTIONS

component

Specifies the type of the component for which you want to display help.

search

Use the search option to find help topics that contain the specified text. The search is case insensitive. Text that contains a space or special tmsh characters must be quoted. Note that the search will not always find text that spans multiple lines.

module

Specifies the module within which the component for which you want to display help resides.

SEE ALSO

tmsh

BIG-IP 2012-10-19 help(1)

install

NAME

install - Install and update components.

MODULE

All tmsh modules.

DESCRIPTION

Use the command install to install or update the following components. For the description and syntax see the help page for each component.

sys license
sys software block-device-hotfix
sys software block-device-image
sys software hotfix
sys software image

SEE ALSO

sys license, sys software block-device-hotfix, sys software block-device-image, sys software hotfix, sys software image, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-04-20 install(1)

list

NAME
list command - Displays components that you have permission to view.

MODULE
All tmsh modules.

SYNTAX
Use the list command within a tmsh module to display the properties of the components in that module. To display the properties of the components in one module from within another module, use the full path to the component.

```
list [component]
list [component] [name]
list [component] [name] [property]
list / [module...module] [component] [name] [property]
```

options:

- all-properties
- current-module
- non-default-properties
- one-line
- partition
- recursive

DESCRIPTION
When the default Read partition is All, use the list command to display all of the components that you have permission to view within a tmsh module. When you specify a Read partition, the list command displays:

- o Only the components that you have permission to view in the current partition
- o All of the components that are not in partitions
- o All of the components in partition Common

EXAMPLES

```
list / ltm
```

From within the gtm module, displays the properties of all of the components in the ltm module, including the components in the ltm monitor, ltm persistence, and ltm profile modules.

```
list / ltm current-module
```

From within the gtm module, displays the properties of all of the components in the ltm module, not including the components in the ltm monitor, ltm persistence, and ltm profile modules.

```
list pool
```

From within the gtm module, displays the properties of all of the Global Traffic Manager pools.

```
list pool all-properties
```

From within the gtm module, displays all of the properties of all of the Global Traffic Manager pools.

```
list pool monitor
```

From within the gtm module, displays the monitor associated with each Global Traffic Manager pool.

```
list / ltm pool
```

From within the gtm module, displays the properties of all of the Local Traffic Manager pools.

OPTIONS

- all-properties**
Displays the values of all of the properties of the specified component.
- component**
Specifies the component that you want to display.
- current-module**
Specifies to display only the components that reside in the specified module, not the components that reside in the sub-modules of that module.

For example, from within the ltm module to display only the components in the gtm module, and not the components in the gtm monitor and gtm settings sub-modules, use the following command sequence: list / gtm current-module.

- module**
Specifies the module within which the component that you want to display resides.

Note: When you use the command list at the module level, by default, the system does not display all of the components that reside in the specified module. To display the properties of some components you must explicitly specify the component. For example, from the ltm module, to display the virtual addresses for the

Local Traffic Manager, use this command sequence:

list virtual-address

For more information about displaying the properties of a component, see the man page for the component.

name Specifies the unique name of the component.

non-default-properties

Displays the values of all of the properties for which a user changed the value from the default value for the specified component.

one-line

Displays the configuration for each object on one line. Configuration that consists of scripts will not be formatted on to a single line. This include ltm and gtm iRules and tmsh scripts.

partition

Displays the administrative partition within which the specified component exists.

property

Specifies the property of the component that you want to display.

recursive

Specifies to display the components not only from the current folder but also from all sub-folders recursively.

BIG-IP 2014-12-30 load(1)

modify

NAME

modify command - Modifies a tmsh component.

MODULE

All tmsh modules.

SYNTAX
Use the command modify within a tmsh module to modify a component that resides in that module. To modify a component in one module from within another module, use the full path to the component.

```
modify [component] [name] [property [value] ]...  
modify / [module...module] [component] [name] [property [value] ]...
```

DESCRIPTION
You must provide the name of the component that you want to modify.

You can apply one or more property settings to multiple components using a single command sequence. For example, to associate the Local Traffic Manager pool named pool-1 with the virtual servers named virtual-1 and virtual-2, use this command sequence: modify ltm virtual virtual-1 virtual-2 pool pool-1

EXAMPLES
modify pool pool1 disabled

From within the gtm module, disables the Global Traffic Manager pool named pool1.

modify / ltm pool my_pool disabled

From within the gtm module, disables the Local Traffic Manager pool named my_pool.

OPTIONS
component
Specifies the type of the component that you want to modify.

module
Specifies the module within which the component that you want to modify resides.

name Specifies the unique name of the component that you want to modify.

property [value]...
Specifies the properties of the component that you want to modify and their new values.

SEE ALSO
tmsh

BIG-IP 2016-03-14 modify(1)

mv

NAME
mv command - Renames or moves a TMOS(tm) configuration object.

MODULE
All tmsh modules.

SYNTAX
Use the mv command within a tmsh module to move or rename the component that resides in that module. To move a component that resides in another module, use the full path to the component.

```
mv [component] [source] [destination]  
mv / [module...module] [component] [source] [destination]
```

DESCRIPTION
You must provide a unique name for the source and destination of the move operation.

WARNING Currently MV is an experimental feature. By using this feature, you may be subject to loss of statistics and disruption in GTM service. If you plan to move or rename a Virtual Server, please contact your GTM administrator before doing so. You may enable this feature by setting the appropriate db variable. This can be done by issuing the command:

modify /sys db mcpd.mvenabled value true

This will turn on the feature and allow moving and rename of select objects through TMSH only. Once you have finished using the feature, we recommend disabling it once again. You may do this by issuing the following command:

modify /sys db mcpd.mvenabled value false

Please use responsibly.

EXAMPLES

```
mv cm device bigip seattle32
```

Renames the device named bigip to seattle32.

```
mv ltm pool mypool myotherpool
```

Renames the LTM Pool named mypool to myotherpool.

```
mv ltm pool /Common/by/mypool /Common/myotherpool  
/Common/sub/mythirdpool to-folder /Partition2/sub1
```

Moves the 3 pools in 3 different locations named mypool, myotherpool and mythirdpool into a single folder in another partition.

OPTIONS

to-folder

Specifies the folder to move the item or items into.

component

Specifies the type of the component that you want to move.

destination

Specifies a unique name for the component.

module

Specifies the module within which the component that you want to move resides.

source

Specifies the component to be moved.

publish

NAME

publish - Finalizes changes in the policy by creating a read-only copy of it.

MODULE

All tmsh modules.

DESCRIPTION

Use the command publish to make wam policies available for usage in wam applications. You can also use this command to apply asm policies. For the description and syntax see the help page for wam policy or asm policy.

SEE ALSO

asm policy, wam policy, tmsh

COPYRIGHT

BIG-IP 2012-09-05 publish(1)

pwd

NAME
pwd command - Display the current working folder.

MODULE
All tmsh modules.

SYNTAX
Use the command pwd to display the current working folder.

pwd

DESCRIPTION
Display the current working folder

EXAMPLES
pwd

SEE ALSO
cd, help, sys folder, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2012-04-05 pwd(1)

quit

NAME
quit command - Exits tmsh.

MODULE
All tmsh modules.

SYNTAX
Use the following command at the tmsh prompt to close tmsh and return to the BIG-IP(r) system prompt.

quit

Note that to exit a tmsh module or component, you use the command exit.

SEE ALSO
tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2010-12-06 quit(1)

reboot

NAME
reboot command - Reboots the system or boots the system into a different volume.

MODULE
All tmsh modules.

SYNTAX
reboot
options:

```
slot [ [slot number] | all ]
volume [name]
```

DESCRIPTION

You can use the command `reboot` to reboot the system or cluster. If you do not specify an option, the local system reboots.

You can use the volume option to reboot a system into a specific volume. For a cluster, you can use the volume option to reboot all slots into the specified volume.

Additionally, for a cluster, you can use the slot option to reboot either a specific slot or all slots. Note that the slot option does not modify the active volume.

EXAMPLES

```
reboot
```

Immediately reboots the running image.

```
reboot volume HD1.2
```

If the volume HD1.2 has a complete image on it, the system (or cluster) reboots into that image immediately. However, if a software installation is in progress on the volume the system reboots as soon as the installation is complete.

OPTIONS

```
slot [ [slot number] | all ]
```

Reboots either a specific slot or all slots in a cluster, without changing the active volume of the slot(s).

This option is only available in a clustered environment.

Note: The slot and volume options are mutually exclusive.

```
volume
```

Specifies the volume that you want to boot. The volume you specify becomes the default boot volume. You cannot specify the active volume. In a clustered environment all slots reboot into the same volume.

Note: The slot and volume options are mutually exclusive.

SEE ALSO

`install`, `sys software hotfix`, `sys software image`, `sys software status`, `sys software volume`, `tmsh`

```
BIG-IP      2012-09-04      reboot(1)
```

reset-stats

NAME

`reset-stats` - Resets statistics for the specified components.

MODULE

All tmsh modules.

SYNTAX

Use the command `reset-stats` within a tmsh module to reset the statistics for the specified component to zero. To reset the statistics for the specified component in one module from within another module, use the full path to the component.

```
reset-stats [component]
reset-stats [component] [name]
reset-stats / [module...module] [component]
reset-stats / [module...module] [component] [name]
```

DESCRIPTION

You can reset statistics for a group of components, or you can reset statistics for a specific component.

After you reset statistics, when you run the command `show`, you may see a value of `nan`. This stands for not a number, which indicates that no data is currently available. Wait a few moments and run the command `show` again, and in most cases the `nan` value will be replaced by an integer value.

It is important to note the following when you reset statistics:

- o For a data center, the system also resets the statistics for the

servers in that data center.

- o For a Global Traffic Manager server, the system also resets the statistics for the virtual servers on that server.

- o For a Global Traffic Manager pool, the system also resets the statistics for the pool members.

- o For a Local Traffic Manager pool, the system also resets the statistics for the pool members.

- o For a VLAN, you must reset the statistics for the trunks and interfaces associated with the VLAN.

- o You cannot reset statistics for system-supplied profiles.

EXAMPLES

```
reset-stats pool
```

From within the gtm module, resets the statistics for all of the Global Traffic Manager pools.

```
reset-stats pool pool1
```

From within the ltm module, resets the statistics for the Local Traffic Manager pool named pool1.

```
reset-stats / ltm pool my_pool
```

From within the gtm module, resets the statistics for the Local Traffic Manager pool named my_pool.

```
reset-stats all-stats
```

From within the sys performance module, resets all performance statistics for the system.

OPTIONS

component

Specifies the type of the component for which you want to reset statistics.

module

Specifies the module within which the component for which you want to reset statistics resides.

name Specifies the unique name of the component for which you want to reset statistics.

SEE ALSO

BIG-IP 2012-04-05 reset-stats(1)

restart

NAME

restart command - Restarts a service on the BIG-IP(r) system.

MODULE

All tmsh modules.

SYNTAX

Use the command restart within tmsh to restart a specified service.

```
restart
```

```
options:
```

```
/sys service [service name]
```

DESCRIPTION

You can use the command restart to restart a specified service.

EXAMPLES

```
restart /sys service mcpd
```

Restarts the mcpd daemon.

```
restart /sys service snmpd
```

Restarts the snmpd daemon.

OPTIONS

Tip: Use the tab completion feature to see a list of available services.

SEE ALSO

start, stop, sys service, tmsh

BIG-IP 2016-03-14 restart(1)

run

NAME

run command - Runs the specified program.

MODULE

All tmsh modules.

SYNTAX

Use the run command within tmsh to run a specified utility.

run

options:

```
/cli script [arguments]
/cm add-to-trust
/cm config-sync
/cm remove-from-trust
/cm sniff-updates
/cm watch-devicegroup-device
/cm watch-sys-device
/cm watch-trafficgroup-device
/gtm big3d_install [arguments]
/gtm bigip_add [arguments]
/gtm gtm_add [arguments]
/ltn monitor [arguments]
/security anti-fraud engine-update
/security anti-fraud signatures-update [arguments]
/sys air-filter-reset
/util bash [arguments]
/util diadb [arguments]
/util dig [arguments]
/util dnat [arguments]
/util get-ccn-dossier
/util get-dossier [arguments]
/util ihealth [arguments]
/util ipsecalgdb [arguments]
/util lsndb [arguments]
/util netstat [arguments]
/util ping [arguments]
/util ping6 [arguments]
/util qkview [arguments]
/util racoonctl [arguments]
/util sipdb [arguments]
/util ssh-keyswap [arguments]
/util sys-icheck [arguments]
/util tcpdump [arguments]
/util tracepath [arguments]
/util tracepath6 [arguments]
/util traceroute [arguments]
/util traceroute6 [arguments]
/wom diagnose-conn
/wom verify-config
```

DESCRIPTION

You can use the run command to run the specified program, utility or process.

You can read about the arguments that are available for the utilities in the cm module using the following command sequence:

```
help /cm [utility name]
```

You can read about the arguments that are available for the utilities in the gtm module using the following command sequence:

```
help /gtm [big3d_install | bigip_add | gtm_add]
```

You can read about the arguments that are available for the utilities in the ltm module using the following command sequence:

```
help /ltn monitor [type]
```

You can read about the arguments that are available for the utilities

in the util module using the following command sequence:

```
help /util [utility name]
```

Note: Some tmsh features, such as tab completion, context-sensitive help, paging, and grep, are not available for utilities.

When you are building a batch mode transaction in tmsh, if you type the run command, the system runs the specified program immediately. It does not add the run command to the transaction that you are building.

EXAMPLES

```
help /util ping
```

Displays the help page for the ping utility.

OPTIONS

```
/cli script
```

Run the specified script, with provided arguments.

```
/cm add-to-trust
```

Add a device to a trust domain.

```
/cm config-sync
```

Synchronize the configuration between devices.

```
/cm remove-from-trust
```

Remove a device from a trust domain.

```
/cm sniff-updates
```

Display the commit ID updates that occur over the CMI communications channel. When you troubleshoot a ConfigSync issue, it is helpful to determine which device group member has the latest commit ID update and contains the most recent configuration. You can then decide whether to replicate the newer configuration to the group, or perform a ConfigSync operation that replicates an older configuration to the group, thus overwriting a newer configuration.

```
/cm watch-devicegroup-device
```

Display information about the devices in the device group to which the local device belongs.

```
/cm watch-sys-device
```

Display information about the local device.

```
/cm watch-trafficgroup-device
```

Display information about the traffic groups associated with devices in a device group.

```
/gtm big3d_install
```

Specifies to install the big3d daemon.

```
/gtm bigip_add
```

Specifies the BIG-IP systems that you want to add to the Global Traffic Manager configuration.

```
/gtm gtm_add
```

Specifies the Global Traffic Manager systems that you want to add to the Global Traffic Manager configuration.

```
/ltm monitor
```

Performs a one-shot test of a custom LTM health monitor against a specified target node.

```
/security anti-fraud engine-update
```

For the description and syntax see the help page for security anti-fraud engine-update.

```
/security anti-fraud signatures-update
```

For the description and syntax see the help page for security anti-fraud signatures-update.

```
/sys air-filter-reset
```

Runs the command to reset the timer and the retry counter for air filter notifications.

```
/util bash
```

Accesses the system shell.

```
/util diadb
```

Displays Diameter persistence entries. The diadb utility displays diameter persistence entries or delete a particular persistence entry.

```
/util dig
```

Runs the specified dig command. The dig utility queries DNS name servers.

```
/util dnat
```

Runs the specified dnat command for the purpose of doing forward/reverse mapping of addresses for DNAT.

```
/util get-ccn-dossier
```

Runs the get_ccn_dossier utility for the purpose of displaying system information for dossier creation.

```
/util get-dossier
```

Runs the get_dossier utility for the purpose of displaying system license dossier information.

```
/util ihealth
```

Runs the ihealth utility for the purpose of uploading a new or existent qkview file to ihealth.

`/util ipsecalgdb`
Runs the ipsecalgdb utility to view IPsecALG translation, and pending IKE connection count entries.

`/util lsndb`
Runs the lsndb utility to view Large Scale NAT persistence entries, inbound mappings, client connection counts, and PCP mappings.

`/util netstat`
Displays network connections, routing tables, interface statistics, masquerade connections, and multicast memberships.

`/util ping`
Runs the specified ping command. The ping utility sends ICMP echo requests to network hosts.

`/util ping6`
Runs the specified ping6 command. The ping6 utility sends ICMPv6 echo requests to network hosts.

`/util qkview`
Runs the specified qkview command. The qkview utility gathers diagnostic information from a BIG-IP system.

`/util racoonctl`
Runs the specified racoonctl command. The racoonctl utility is used to control operation of the racoon daemon.

`/util sipdb`
Displays SIP persistence entries. The sipdb utility displays specific persistence entries and deletes a particular persistence record.

`/util ssh-keyswap`
Runs the keyswap.sh script for managing SSH keys on the BIG-IP.

`/util sys-icheck`
Runs the specified sys-icheck command. The sys-icheck utility verifies all RPM packages and files.

`/util tcpdump`
Runs the specified tcpdump command. The tcpdump utility prints headers and content of network traffic.

`/util tracepath`
Displays the route packets take to a network host.

`/util tracepath6`
Displays the route packets take to an IPv6 network host.

`/util traceroute`
Displays the route packets take to a network host.

`/util traceroute6`
Displays the route packets take to an IPv6 network host.

`/wom diagnose-conn`
Runs the specified diagnose-conn script, which detects the sources of network connection and performance problems in a WAN optimization configuration.

`/wom verify-config`
Runs the specified verify-config script, which detects errors in the configuration of the WAN Optimization Manager.

BIG-IP 2017-03-28 run(1)

save

NAME save - Writes the running configuration of the BIG-IP(r) system to the specified file.

MODULE All tmsh modules.

DESCRIPTION You can use the save command to write changes that you make to the running configuration of the BIG-IP system to the specified file. You can also use this command to save an analytics report to a file on the BIG-IP(r) system or to export an ASM policy to a file / standard output.

SEE ALSO analytics report, asm policy, load, sys config, sys ucs, tmsh

COPYRIGHT No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2012. All rights reserved.

BIG-IP 2012-10-16 save(1)

send-mail

NAME send-mail - Send an e-mail to a list of recipients containing configuration or statistical information about the BIG-IP(r) system.

MODULE All tmsh modules.

DESCRIPTION You can use the send-mail command to send an analytics report from the BIG-IP system to a list of e-mail recipients.

SEE ALSO analytics report, tmsh

COPYRIGHT No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015-07-22 send-mail(1)

show

NAME show command - Displays statistics for and the status of specified components.

MODULE All tmsh modules.

SYNTAX Use the show command within a tmsh module to display statistics for and the status of components in that module. To display statistics for and the status of components in another module, use the full path to the component.

```
show
show [component]
show [component] [name]
show / [module] [component] [name]
options:
all-stats
```

current-module
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
(detail | global | historical)
field-fmt
running-config
recursive

DESCRIPTION

You can use the show command to specify the unit value in which the system displays statistics and the type of statistics that you want the system to display.

After you reset statistics, when you run the command show, you may see a value of nan. This stands for not a number, which indicates that no data is currently available. Wait a few moments and run the show command again, and in most cases the nan value is replaced by an integer value. For more information, see help reset-stats.

EXAMPLES

```
show / ltm current-module
```

From within the gtm module, displays statistics and status for all the components within the ltm module, but not the components in the ltm monitor, ltm persistence, and ltm profile modules.

```
show pool
```

From within the gtm module, displays statistics and status for all Global Traffic Manager pools.

```
show pool pool1
```

From within the gtm module, displays statistics and status for the Global Traffic Manager pool named pool1.

```
show / ltm pool
```

From within the gtm module, displays statistics and status for all Local Traffic Manager pools.

```
show / ltm profile tcp global
```

From within the gtm module, displays global statistics and status for all Local Traffic Manager TCP profiles in the system default unit.

OPTIONS

all-stats

Displays all of the available system performance statistics.

component

Specifies the type of the component for which you want to show statistics and status.

current-module

Specifies to display only the components that reside in the specified module, not the components that reside in the sub-modules of that module.

For example, from within the ltm module to display only the components in the gtm module, and not the components in the gtm monitor and gtm settings sub-modules, use this command sequence:
show / gtm current-module.

default

Displays data in the simplest units. For example, if the value of the data is 1,200,001, the system displays 1.20M; however, if the value of the data is 1,200, the system displays 1.2K.

detail

Displays detailed data for the specified component and associated components. Note that this option is available for only a partial set of tmsh components.

You can use the tab completion and context-sensitive help features to determine if this option is available. For more information about these features, see help.

field-fmt

Displays data as a list of options and their values. The option names can be used to retrieve statistics and status values in a shell script, see cli script.

gig Displays data in parts per billion.

global

Displays global statistics for the specified component that includes statistics for all components of the specified type. Note that this option is available for only a partial set of tmsh components. You can use the tab completion and context-sensitive help features to determine if this option is available.

historical

Displays historical statistics for the specified component. Note that this option is available only for a partial set of tmsh components. You can use the tab completion and context-sensitive help features to determine if this option is available.

kil Displays data in parts per thousand.

lines

Specifies how many lines of the log that you want the system to display.

meg Displays data in parts per million.

module

Specifies the module within which the component for which you want to show statistics and status resides.

Note: When you use the command show at the module level, by default, the system does not display all of the components that reside in the module. To display some components you must explicitly specify the component. For example, from the ltm module, to display the statistics for and status of the virtual addresses of the Local Traffic Manager, use the following command sequence:

```
show virtual-address
```

For more information about displaying statistics for and status of a component, see the man page for the component.

name Specifies the unique name of the component for which you want to show statistics and status.

range

Specifies a date range for the logs that you want the system to display, for example:

```
2d-4d
```

Specifies 2 - 4 days ago.

```
3d
```

 Specifies 3 days ago to now.

```
epoch--7/25:12:00:00
```

Specifies everything older than July 25th at noon.

```
2008-07-25--2008-07-28:13:30
```

Specifies between July 25th and 28th at 1:30 p.m.

```
raw
```

 Displays raw data.

recursive

Specifies to display the components not only from the current folder, but also from all sub-folders recursively.

running-config

Displays the running configuration of the components that you have permission to view within a tmsh module, if the default Read partition is All. If you specify a Read partition, this option displays only the components that you have permission to view in the current partition, all of the components that are not in partitions, and all of the components in partition Common. Note that this option is valid only for tmsh components you can configure.

The running-config option must be specified immediately after the show command, for example:

```
show running-config ltm pool
```

shutdown

NAME

shutdown command - Shuts down the system.

MODULE

All tmsh modules.

SYNTAX

```
shutdown
options:
slot [ [slot number] | all ]
```

DESCRIPTION

You can use the command shutdown to power down the system or cluster. If you do not specify an option, the local system shuts down.

For a cluster, you can use the slot option to shut down either a specific slot or all slots.

EXAMPLES

shutdown

Immediately shuts down the running system.

OPTIONS

slot [[slot number] | all]

Shuts down either a specific slot or all slots in the cluster.

This option is only available in a clustered environment.

SEE ALSO

reboot, install

BIG-IP 2013-03-21 shutdown(1)

start

NAME

start command - Starts a service on the BIG-IP(r) system.

MODULE

All tmsh modules.

SYNTAX

Use the start command within tmsh to restart a specified service.

start

options:

/sys service [service name]

DESCRIPTION

You can use the start command to start a specified service.

EXAMPLES

start /sys service mcpd

Starts the mcpd daemon.

start /sys service snmpd

Starts the snmpd daemon.

OPTIONS

Tip: Use the tab completion feature to see a list of available services.

SEE ALSO

restart, stop, sys service, tmsh

COPYRIGHT

F5 Networks and BIG-IP (c) Copyright 2009-2013, 2016. All rights reserved.

BIG-IP 2016-03-14 start(1)

stop

NAME

stop command - Stops a service or test operation that is running on the BIG-IP(r) system.

MODULE

All tmsh modules.

SYNTAX

Use the command stop within tmsh to stop a running service or test operation.

stop

options:

/sys service [service name]
/ltm monitor [arguments]

DESCRIPTION

You can use the command stop to stop a running service or test operation.

EXAMPLES

stop /sys service mcpd

Stops the mcpd daemon.

stop /sys service snmpd

Stops the snmpd daemon.

stop /ltm monitor http my_http

Cancel a pending health monitor test for the custom ltm http monitor my_http.

OPTIONS

Tip: Use the tab completion feature to see a list of available services.

SEE ALSO

ltm monitor, restart, start, sys service, tmsh

BIG-IP 2017-03-24 stop(1)

submit

NAME

submit - Runs the transaction that you are creating.

MODULE

All tmsh modules.

SYNTAX

Use the submit command to run a transaction that you are creating.

submit transaction

DESCRIPTION

You can use the submit command to run a transaction, which is a series of commands that you enter in transaction mode.

For more information about creating transactions, see cli transaction.

SEE ALSO

cli transaction, tmsh

      sort-type [ asc / desc ]
    } ...
  }
  }
```

```
}
range [date range]
smtp-config-override [ smtp configuration object name ]
```

DESCRIPTION

Use this command to generate afm-sweeper analytics reports. You can generate an afm-sweeper analytics report for the following entities:

- o policy-name - Name of the sweeper policy.
- o context-type - The context type of the eviction. Can be one of three possible values: "Virtual Server", "Route Domain", "Global".
- o context-name - The name of the context. Depends on the context-type this value can be either a virtual server name (e.g. "my_vs1"), route domain id (e.g. 317) or "Global".
- o eviction-reason - The algorithm used by sweeper that caused the eviction of a connection.
- o client-ip - The source IP of the evicted connection.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics afm-sweeper report view-by client-ip

show analytics afm-sweeper report view-by client-ip drilldown { {
entity context-type values { Global } } }

send-mail analytics afm-sweeper report view-by client-ip measures {
avg-connections-age } limit 15 order-by { { measure avg-connections-age
sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

avg-connections-age
The average time that the connections lasted before evicted for the selected filter (entity).

evicted-connections
The total number of evicted connections for the selected filter (entity).

total-bytes-in
The total number of bytes received for the selected filter (entity).

total-bytes-out
The total number of bytes sent for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics afm-sweeper scheduled-report

NAME
scheduled-report - Configure scheduled reports for AFM sweeper.

MODULE
analytics afm-sweeper

SYNTAX
Configure the scheduled-report component within the analytics afm-sweeper module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
 email-addresses [none | add | delete | modify |
 replace-all-with] { email-address [string] }
 first-time [date]
 frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
 include-total [enabled | disabled]
 multi-leveled-report {
 chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
 limit [number of rows]
 time-diff [last-hour | last-day | last-week | last-month | last-year]
 view-by { entity name [string] }
 measures [none | add | delete | modify | replace-all-with] { measure name [string] }
 }
 predefined-report-name [name]
 smtp-config [name]
 device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the AFM sweeper module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the AFM sweeper scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics afm-sweeper report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics afm-sweeper report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]
```

DESCRIPTION

Use this command to generate application-security-anomalies analytics reports. You can generate an application-security-network analytics report for the following entities:

- o anomaly-type - Anomaly type (Brute Force/Web Scraping)
- o application - Application services.
- o policy - Security policy.
- o virtual - Virtual servers.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics application-security-network report view-by application
show analytics application-security-network report view-by application
drilldown { { entity virtual values { my_vip } } }
```

```
send-mail analytics application-security-anomalies report view-by
virtual measures { rejected-requests } limit 20 order-by { { measure
rejected-requests sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

rejected-requests

The total number of rejected requests for the selected filter (entity).

total-attacks

The total number of attacks for the selected filter (entity).

total-violations

The total number of violations for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics application-security-anomalies scheduled-report

NAME
scheduled-report - Configure scheduled reports for application security anomalies (ASM anomalies).

MODULE
analytics application-security-anomalies

SYNTAX
Configure the scheduled-report component within the analytics application-security-anomalies module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]

show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the application security anomalies (ASM anomalies) module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the application security anomalies (ASM anomalies) scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with **predefined-report-name**. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics application-security-anomalies report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics application-security-anomalies report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with **multi-leveled-report**.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate application-security-anomalies analytics reports. You can generate an application-security-network analytics report for the following entities:

- o anomaly-type - Anomaly type (Brute Force/Web Scraping)
- o application - Application services.
- o policy - Security policy.
- o virtual - Virtual servers.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics application-security-network report view-by application
```

```
show analytics application-security-network report view-by application
drilldown { { entity virtual values { my_vip } } }
```

```
send-mail analytics application-security-anomalies report view-by
virtual measures { rejected-requests } limit 20 order-by { { measure
rejected-requests sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

rejected-requests
The total number of rejected requests for the selected filter (entity).

total-attacks
The total number of attacks for the selected filter (entity).

total-violations
The total number of violations for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

DESCRIPTION

Use this command to generate application-security-network analytics reports. You can generate an application-security-network analytics report for the following entities:

- o application - Application services.
- o virtual - Virtual servers.
- o request-type - Request types (Legal/Alarmed/Blocked).
- o policy - Security policy.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics application-security-network report view-by violation

show analytics application-security-network report view-by violation
drilldown { { entity severity values { Error } } }

send-mail analytics application-security-network report view-by virtual
measures {events} limit 20 order-by { {measure events sort-type desc
} } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

events
The total number of events (requests) for the selected filter (entity).

throughput
The average throughput (bits/s) for the selected filter (entity).

tps The average number of transactions per second for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics application-security-network scheduled-report

NAME
scheduled-report - Configure scheduled reports for application security network (ASM network).

MODULE
analytics application-security-network

SYNTAX
Configure the scheduled-report component within the analytics application-security-network module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the application security network (ASM network) module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the application security network (ASM network) scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics application-security-network report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics application-security-network report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

DESCRIPTION

Use this command to generate application-security analytics reports. You can generate an application-security analytics report for the following entities:

- o application - Application services.
- o virtual - Virtual servers.
- o request-type - Request types (Legal/Alarmed/Blocked).
- o severity - Violation severities.
- o rating - Violation ratings.
- o username - User names.
- o attack-type - Attack type of the illegal request.
- o ip-address-intelligence - IP Address reputation categories.
- o policy - Security policy.
- o response-code - Response codes.
- o ip - Source IP addresses.
- o violation - Violation types.
- o country - Countries of the source IP address.
- o method - HTTP methods.
- o protocol - Protocols (HTTP/HTTPS).
- o session-id - IDs of sessions.

- o url - Requested URLs.
- o virus - Viruses that were detected by the system.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics application-security report view-by violation

show analytics application-security report view-by violation drilldown
{ { entity severity values { Error } } }

send-mail analytics application-security report view-by ip measures
{requests} limit 20 order-by { { measure requests sort-type desc } }
format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file
Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

requests
The total number of requests for the selected filter (entity).

occurrences
Number of occurrences for the selected filter (relevant for attack-type, violation and ip-address-intelligence entities)

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics application-security scheduled-report

NAME
scheduled-report - Configure scheduled reports for application security (ASM).

MODULE
analytics application-security

SYNTAX
Configure the scheduled-report component within the analytics application-security module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the application security module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the application security scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in

results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with **predefined-report-name**. The **multi-leveled-report** definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics application-security report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics application-security report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with **multi-leveled-report**.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate asm-bypass analytics reports. You can generate an asm-bypass analytics report for the following entities:

- o slot - Blade Number
- o memory - BD memory

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics asm-bypass report view-by slot
```

```
show analytics asm-bypass report view-by slot drilldown { { entity slot
values { slot_index } } }
```

```
end-mail analytics asm-bypass report view-by slot measures { backlog-
messages } limit 20 order-by { { measure backlog-messages sort-type
desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

backlog-messages

The sum of backlog messages for the selected filter (entity).

http-requests

The sum of HTTP requests for the selected filter (entity).

transactions-bypass

The sum of transactions bypass for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics asm-bypass scheduled-report

NAME

scheduled-report - Configure scheduled reports for ASM bypass.

MODULE

analytics asm-bypass

SYNTAX

Configure the scheduled-report component within the analytics asm-bypass module using the syntax shown in the following sections.

CREATE/MODIFY

create scheduled-report [name]

modify scheduled-report [name]

options:

email-addresses [none | add | delete | modify |

replace-all-with] { email-address [string] }

first-time [date]

frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]

```
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the ASM bypass module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the ASM bypass scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics asm-bypass report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics asm-bypass report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually

exclusive with multi-leveled-report.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate asm-cpu analytics reports. You can generate an asm-cpu analytics report for the following entities:

- o virtual - Virtual servers.
- o slot - Blade Number

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics asm-cpu report view-by slot
```

```
show analytics asm-cpu report view-by slot drilldown { { entity slot
values { slot_index } } }
```

```
send-mail analytics asm-cpu report view-by slot measures { bd-cpu-
utilization } limit 20 order-by { { measure bd-cpu-utilization sort-
type desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

bd-cpu-utilization

The BD CPU utilization for the selected filter (entity).

tmm-cpu-utilization
The TMM CPU utilization for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics asm-cpu scheduled-report

NAME
scheduled-report - Configure scheduled reports for ASM CPU.

MODULE
analytics asm-cpu

SYNTAX
Configure the scheduled-report component within the analytics asm-cpu module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
email-addresses [none | add | delete | modify |
replace-all-with] { email-address [string] }
first-time [date]
frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the ASM CPU module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to

none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the ASM CPU scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics asm-cpu report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics asm-cpu report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate asm-memory analytics reports. You can generate a ASM memory analytics report for the following entities:

o slot - Slot ID

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics asm-memory report view-by slot
```

```
show analytics asm-memory report view-by slot drilldown { { entity slot  
values { slot_index } } }
```

```
send-mail analytics asm-memory report view-by slot measures { total-  
swap-size } limit 20 order-by { { measure total-swap-size sort-type  
desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

bd-memory-utilization

The BD memory utilization out of total assigned to BD (in percents) for the selected filter (entity).

tmm-memory-util

The TMM memory utilization out of total assigned to TMM (in percents) for the selected filter (entity).

bd-swap-size

The swap used by BD in MBs for the selected filter (entity).

total-swap-size

The total swap used in MBs for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the ASM memory module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the ASM memory scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with **predefined-report-name**. The **multi-leveled-report** definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics asm-memory report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics asm-memory report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with **multi-leveled-report**.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics asm-violation scheduled-report

NAME
scheduled-report - Configure scheduled reports for ASM violation.

MODULE
analytics asm-violation

SYNTAX
Configure the scheduled-report component within the analytics asm-violation module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
```

```
smtp-config [name]
device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the ASM violation module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the ASM violation scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics asm-violation report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics asm-violation report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the

report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

  [email address ...]
}
format [ csv-aggregated | csv-time-series | pdf ]
include-total
include-others
limit [number of rows]
measures {
  [measure name ...]
}
order-by {
  {
    measure [ measure name ]
    sort-type [ asc / desc ]
  } ...
}
range [date range]
smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate cpu analytics reports. You can generate a IP-layer analytics report for the following entities:

- o slot - Slot ID
- o cpu - CPU number ID

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics cpu report view-by cpu
```

```
show analytics cpu report view-by cpu drilldown { { entity cpu values {
1 } } }
```

```
send-mail analytics cpu report view-by slot measures { cpu-usage }
limit 20 order-by { { measure cpu-usage sort-type desc } } format pdf
email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

cpu-usage

The average time percentage of real CPU usage (user + system + nice) usage for the selected filter (entity).

io The average time percentage of (iowait + irq + softirq) for the selected filter (entity).

stolen

The average time percentage of virtual CPU waits for a real CPU while the hypervisor is servicing another virtual processor.

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics cpu scheduled-report

NAME
scheduled-report - Configure scheduled reports for CPU.

MODULE
analytics cpu

SYNTAX
Configure the scheduled-report component within the analytics cpu module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]

```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the CPU module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the CPU scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics cpu report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics cpu report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate disk-info analytics reports. You can generate a disk-info analytics report for the following entities:

- o slot - Slot ID

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics disk-info report view-by slot
```

```
show analytics disk-info report view-by slot drilldown { { entity slot
values { 7 } } }
```

```
send-mail analytics disk-info report view-by slot measures { total-ios
} limit 20 order-by { { measure total-ios sort-type desc } } format pdf
email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

total-ios
The total number of I/O for the selected filter (entity).

read-operations
The total number of read operations for the selected filter (entity).

read-merged
The total number of merged reads for the selected filter (entity).

write-operations
The total number of write operations for the selected filter (entity).

write-merged
The total number of merged writes for the selected filter (entity).

read-bytes
The total number of read bytes for the selected filter (entity).

write-bytes
The total number of write bytes for the selected filter (entity).

max-read-latency
The max value of read latency for the selected filter (entity).

average-read-latency
The average number of average read latency for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

list scheduled-report [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [name] | [glob] | [regex] ] ... ]

```

```

DELETE
delete scheduled-report [name]

```

DESCRIPTION
 Use the scheduled-report component to create, modify or delete scheduled reports for the disk information module.

EXAMPLES

```

create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf

```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```

modify scheduled-report myScheduledReport smtp-config none

```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```

create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }

```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```

list scheduled-report

```

Displays all of the disk information scheduled reports.

OPTIONS

email-addresses
 A list of the email addresses of the recipients that receive the scheduled report.

first-time
 First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
 The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
 Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
 Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
 A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics disk-info report.

limit
 The number of view-by entities displayed in the scheduled report.

time-diff
 The time range for the report.

view-by
 The main entity that the report is viewed by. For a list of

valid entities see the help manual for analytics disk-info report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics dns-protocol scheduled-report

NAME

scheduled-report - Configure scheduled reports for DNS protocol.

MODULE

analytics dns-protocol

SYNTAX

Configure the scheduled-report component within the analytics dns-protocol module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the DNS protocol module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the DNS protocol scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics dns-protocol report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics dns-protocol report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics dns report

NAME
report - Displays a DNS analytics report.

MODULE
analytics dns

SYNTAX
Show, save or send an analytics dns report using the syntax shown in the following sections.

DISPLAY
show report view-by [activity-type | application | attack-id | client-ip | country | country-code | dns-transaction-o
options:
 drilldown {
 {
entity [activity-type | application | attack-id | client-ip | country | country-code | dns-transaction-outcome | dom
values
 {
 [value ...]
 }
 } ...
}
 field-fmt
 include-total
 include-others
 limit [number of rows]
 measures {
 [measure name ...]
 }
 order-by {
 {
 measure [measure name]
 sort-type [asc | desc]
 } ...
 }
 range [date range]

SAVE
save report view-by [activity-type | application | attack-id | client-ip | country | country-code | dns-transaction-o
options:
 drilldown {
 {
entity [activity-type | application | attack-id | client-ip | country | country-code | dns-transaction-outcome | dom
values
 {
 [value ...]
 }
 } ...
}
 file [file name]
 format [csv-aggregated | csv-time-series | pdf]
 include-total
 include-others
 limit [number of rows]
 measures {
 [measure name ...]
 }
 order-by {
 {
 measure [measure name]
 sort-type [asc | desc]
 } ...
 }
 range [date range]

SEND
send-mail report view-by [activity-type | application | attack-id | client-ip | country | country-code | dns-transact
options:
 drilldown {
 {
entity [activity-type | application | attack-id | client-ip | country | country-code | dns-transaction-outcome | dom
values
 {
 [value ...]
 }
 } ...
}
 email-addresses {
 [email address ...]
 }
 format [csv-aggregated | csv-time-series | pdf]
 include-total
 include-others
 limit [number of rows]
 measures {
 [measure name ...]
 }
 order-by {
 {
 measure [measure name]
 sort-type [asc | desc]
 } ...
 }
 range [date range]
 smtp-config-override [smtp configuration object name]

DESCRIPTION

Use this command to generate DNS analytics reports. You can generate a DNS analytics report for the following entities:

- o activity-type - Activity type.
- o application - Application services (iApps(tm)).
- o attack-id - (Only available with AFM is provisioned) DoS Attack ID.
- o client-ip - DNS query source/client IP address.
- o country - Country.
- o country-code - Country code.
- o dns-transaction-outcome - Request outcome.
- o domain-name - Queried domain name.
- o dos-profile - DoS profile.
- o mitigation - Mitigation.
- o query-type - DNS query type.
- o suspected-ip - Suspected address IP.
- o trigger - Trigger.
- o vector - Attack vector.
- o virtual - Virtual server.

EXAMPLES

```
show analytics dns report view-by virtual
```

```
show analytics dns report view-by query-type drilldown { { entity  
virtual values { /Common/v1 } } }
```

```
send-mail analytics dns report view-by client-ip limit 20 format pdf  
email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

attacks-count

The total number of DNS attacks for the specified view-by entity.

packets

The total number of DNS packets for the specified view-by entity.

packets-per-second

The average number of DNS packets for the specified view-by entity.

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each

measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics dns scheduled-report

NAME
scheduled-report - Configure scheduled reports for DNS.

MODULE
analytics dns

SYNTAX
Configure the scheduled-report component within the analytics dns module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
email-addresses [none | add | delete | modify |
replace-all-with] { email-address [string] }
first-time [date]
frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the DNS module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config

```
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the DNS scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics dns report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics dns report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION Use this command to generate DoS (Layers 3-4) prevention analytics reports. You can generate a DoS prevention analytics report for the following entities:

- o action - Action taken (allowed/dropped).
- o activity-type - Activity type.
- o application - Application services (iApps(tm)).
- o attack-id - DoS attack ID.
- o category - Attack category.
- o client-ip - Source/client IP address.
- o country - Country.
- o country-code - Country code.
- o dest-country - Destination country.
- o dest-country-code - Destination country code.
- o dos-profile - DoS profile.
- o mitigation - Mitigation.
- o server-ip - Server address IP.
- o suspected-ip - Suspect address IP.
- o trigger - Trigger.
- o vector - Attack vector.
- o virtual - Virtual server.
- o vlan - VLAN.
- o vlan-group - VLAN Group.

EXAMPLES

```
show analytics dos-l3 report view-by virtual
```

```
show analytics dos-l3 report view-by attack-type drilldown { { entity
virtual values { /Common/v1 } } }
```

```
send-mail analytics dos-l3 report view-by source-ip limit 20 format pdf
email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

allowed-requests

The total number of packets that were received by the virtual server(/s)s

allowed-requests-per-second

The average number of packets that were received by the virtual server(/s)s

attacks-count

The total number of attacks for the selected view-by entity.

dropped-requests
The total number of packets that were dropped by the virtual server(/s)s

dropped-requests-per-second
The average number of packets that were dropped by the virtual server(/s)s

total-requests
The total number of packets that were received or dropped by the virtual server(/s)s

total-requests-per-second
The average number of packets that were received or dropped by the virtual server(/s)s

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2018-07-16 analytics dos-l3 report(1)

analytics dos-l3 scheduled-report

NAME
scheduled-report - Configure scheduled reports for DoS L3.

MODULE
analytics dos-l3

SYNTAX
Configure the scheduled-report component within the analytics dos-l3 module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the DoS L3 module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-  
report-name "Top blocked URLs" frequency every-6-hours email-addresses  
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the DoS L3 scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics dos-l3 report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics dos-l3 report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

DESCRIPTION

Use this command to generate HTTP analytics reports. You can generate an HTTP analytics report for the following entities:

- o activity-type - Activity type.
- o application - Application services.
- o attack-id - Application/L7 DoS Attack ID.
- o behavioral-signature - Behavioral signature.
- o bot-defense-reason - BOT defense reason.
- o browser - Browser.
- o client-ip - A single client identified by an IP address.
- o client-subnet - Client subnet.
- o country - A country from which HTTP/HTTPs traffic was sent to each of the virtual servers.
- o country-code - Country code from which HTTP/HTTPs traffic was sent to each of the virtual servers.
- o device-id - Device ID.
- o dos-mobile-app-client-type - DoS mobile application client type.
- o dos-mobile-app-display-name - DoS mobile application display name.
- o dos-mobile-app-emulation-mode - DoS mobile application emulation mode.
- o dos-mobile-app-human-behavior - DoS mobile application human behavior.
- o dos-mobile-app-jail-break - DoS mobile application jail break.
- o dos-mobile-app-version-name - DoS mobile application version name.
- o dos-profile - DoS Profile.
- o dosl7-bot-signature - DoS Layer 7 bot signature.
- o dosl7-bot-signature-category - DoS Layer 7 bot category.
- o http-method - Method.
- o http-transaction-outcome - HTTP Transaction outcomes (Blocked/Dropped/Passed/etc.)
- o mitigation - Mitigation.
- o os - OS name.
- o pool-member - Pool members.
- o response-code - An HTTP response code that was sent back to the client.
- o suspected-ip - Suspected address IP.
- o trigger - Trigger.
- o url - A URL accessed by HTTP or HTTPs.
- o user-agent - A browser identifier sent by the client's browser as part of the request for URL.

- o vector - Attack vector.
- o virtual - Virtual servers.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics dos-17 report view-by virtual measures {average-tps}
limit 20
```

Gets the average tps of 20 virtual servers (unordered).

```
show analytics dos-17 report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } }
```

Gets the average tps of the top 20 virtual servers.

```
show analytics dos-17 report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } } range
now-3d--now
```

Gets the average tps of the top 20 virtual servers from the last three days.

```
show analytics dos-17 report view-by virtual drilldown { { entity
application values { app } } { entity pool-member values { p1 p2 } } }
range now-4d--now-2d measures {average-tps} limit 10 order-by { {
measure average-tps sort-type DESC } }
```

Gets the average tps of the top 10 virtual servers (ordered by average tps) on app iApp (out of several monitored) on pool members p1 and p2 (out of five monitored p1-p5) in the interval ranging from two to four days ago.

```
show analytics dos-17 report view-by response-code drilldown { { entity
virtual values { v1 } } } measures { transactions }
```

Gets a distribution of requests per response code on virtual v1.

```
show analytics dos-17 report view-by country drilldown { { entity
application values { app } } } measures { average-concurrent-sessions
average-sessions } order-by { { measure average-sessions sort-type DESC
} } limit 5
```

Gets the new sessions and average concurrent sessions of the top five countries, ordered by the average concurrent sessions on the application app.

```
show analytics dos-17 report view-by client-ip drilldown { { entity
virtual values { v1 } } } measures { max-page-load-time } limit 1
```

Gets the client IP address with the worst page load time.

```
show analytics dos-17 report view-by application drilldown { { entity
pool-member values { p1 p2 } } } measures { transactions } order-by { {
measure transactions } } range now-7d--now
```

Gets the distribution of requests per application on pool members p1 and p2 ordered by the number of requests during the last week.

```
save analytics dos-17 report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } } format pdf
file report.pdf
```

Gets the average tps of the top 20 virtual servers and exports to a PDF file on the BIG-IP system.

```
save analytics dos-17 report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } } format
csv-aggregated file report.csv
```

Gets the average tps of the top 20 virtual servers and exports to a CSV file on the BIG-IP system.

```
save analytics dos-17 report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } } format
csv-time-series file report.csv
```

Gets the average tps over time of the top 10 virtual servers and exports to a CSV file on the BIG-IP system.

```
send-mail analytics dos-17 report view-by virtual measures
{average-tps} limit 20 order-by { { measure average-tps sort-type desc
} } format pdf email-addresses { some.one@someaddress.com }
```

Gets the average tps over time of the top 10 virtual servers and sends out an email containing the report as a PDF.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

`file` Specifies the exported file path to be saved when using the `save` command. The file name should be simple (not a full path).

`format`
Specifies the exported file format to be saved or sent. This option must be specified when using the `save` or `send-mail` commands.

`include-others`
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with `include-total`.

`include-total`
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

`limit`
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

`measures`
Specifies a list of measures that can be used with the chosen entity type. The default value is transactions. The options are:

`average-concurrent-sessions`
The average number of concurrent sessions for each entity.

`average-new-sessions`
The average number of new sessions for each entity.

`average-page-load-time`
The average client page load time for each entity.

`average-request-throughput`
The average request throughput for each entity.

`average-response-throughput`
The average response throughput for each entity.

`average-server-latency`
The average server latency for each entity.

`average-tps`
The average number of transactions per second for each entity.

`client-side-sampled-transactions`
The number of transactions sampled for client side page load time.

`max-page-load-time`
The maximum client page load time for each entity.

`max-request-throughput`
The maximum request throughput for each entity.

`max-response-throughput`
The maximum response throughput for each entity.

`max-server-latency`
The maximum server latency for each entity.

`max-tps`
The maximum number of transactions per second for each entity.

`transactions`
The absolute number of transactions for each entity.

`min-server-latency`
The minimum server latency for each entity.

`average-request-size`
The average request size for each entity.

`average-response-size`
The average response size for each entity.

`average-application-response-time`
The average application response time for each entity.

`min-application-response-time`
The minimum application response time for each entity.

`max-application-response-time`
The maximum application response time for each entity.

`average-client-ttfb`
The average client TTFB for each entity.

`min-client-ttfb`
The minimum client TTFB for each entity.

`max-client-ttfb`
The maximum client TTFB for each entity.

`average-clientside-network-latency`
The average client-side network latency for each entity.

`min-clientside-network-latency`

The minimum client-side network latency for each entity.

max-clientside-network-latency

The maximum client-side network latency for each entity.

average-serverside-network-latency

The average server-side network latency for each entity.

min-serverside-network-latency

The minimum server-side network latency for each entity.

max-serverside-network-latency

The maximum server-side network latency for each entity.

average-request-duration

The average request duration for each entity.

min-request-duration

The minimum request duration for each entity.

max-request-duration

The maximum request duration for each entity.

average-response-duration

The average response duration for each entity.

min-response-duration

The minimum response duration for each entity.

max-response-duration

The maximum response duration for each entity.

attacks-count

The total number of attack for each entity.

valid

The total number of valid transactions for each entity.

average-valid-tps

The average number of valid transactions for each entity.

mitigated

The total number of mitigated transaction for each entity.

average-mitigated-tps

The average number of mitigated transaction for each entity.

blocked

The total number of blocked transactions for each entity.

average-blocked-tps

The average number of blocked transactions for each entity.

incomplete

The total number of incomplete transactions for each entity.

average-incomplete-tps

The average number of incomplete transactions for each entity.

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The default value for measures is previously chosen measures. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

DESCRIPTION Use this command to generate DoS Attacks analytics reports. You can generate a DoS Attacks analytics report for the following entities:

- o attack-id - Unique attack ID.

- o event-idx - Index of an event in an attack.
- o protocol - Attacked protocol (HTTP, DNS, SIP, Network).
- o virtual - Name of the attacked Virtual Server.
- o dos-profile - DoS profile that detects and mitigates the attack.
- o trigger - Threshold that was hit to indicate the attack.
- o vector - Attack vector (used by AFM, ASM has only 1 vector).
- o mitigation - Mitigation to the attack.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics dos-vis-attacks report view-by virtual
```

```
show analytics dos-vis-attacks report view-by virtual drilldown { {
entity protocol values { DNS } } }
```

```
send-mail analytics dos-vis-attacks report view-by virtual measures {
attack-severity } limit 15 order-by { { measure attack-severity sort-
type desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

event-start

The start moment of the event.

event-end

The end moment of the event.

total-blocked

Total number of blocked transactions.

concurrent-ips

Maximum number of simultaneous attacking IPs per 10 second interval.

severity

Calculated severity of the attack.

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

DESCRIPTION

Use this command to generate firewall NAT analytics reports. You can generate a firewall NAT analytics report for the following entities:

- o name - Name.
- o lsn_pool - LSN pool name.

EXAMPLES

```

show analytics fw-nat report view-by name

show analytics fw-nat report view-by name drilldown { { entity name
values { my_name } } }

send-mail analytics fw-nat report view-by name limit 20 format pdf
email-addresses { some.one@someaddress.com }

```

For more syntactical examples see manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. This option must be used with the drilldown option. You can also use it along with include-others.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

avg-source-translation-requests
The average number of FW NAT source translation requests for the selected filter (entity).

avg-source-translation-request-failures
The average number of FW NAT source translation request failures for the selected filter (entity).

avg-destination-translation-requests
The average number of FW NAT destination translation requests for the selected filter (entity).

avg-destination-translation-request-failures
The average number of FW NAT destination translation request failures for the selected filter (entity).

avg-active-translations
The average number of FW NAT active translations for the

selected filter (entity).

avg-backup-pool-translations
The average number of FW NAT backup-pool translations for the selected filter (entity).

avg-log-attempts
The average number of FW NAT log attempts for the selected filter (entity). Only applies to FW NATs in logging mode.

avg-log-failures
The average number of FW NAT log failures for the selected filter (entity). Only applies to FW NATs in logging mode.

avg-active-port-blocks
The average number of FW NAT active port-blocks for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-port-block-allocations
The average number of FW NAT port-block allocations for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-port-block-deallocations
The average number of FW NAT port-block de-allocations for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-zombie-port-blocks-created
The average number of FW NAT zombie port-blocks which have been created for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-zombie-port-blocks-deleted
The average number of FW NAT zombie port-blocks which have been deleted for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-active-clients-reached-limit
The average number of FW NAT active-clients limit reached for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-clients-reached-limit
The average number of FW NAT total-clients limit reached for the selected filter (entity). Only applies to FW NATs in PBA mode.

avg-pcp-request
The average number of FW NAT PCP-requests for the selected filter (entity). Only applies to FW NATs in PCP mode.

avg-pcp-response
The average number of FW NAT PCP-responses for the selected filter (entity). Only applies to FW NATs in PCP mode.

avg-pcp-error
The average number of FW NAT PCP-errors for the selected filter (entity). Only applies to FW NATs in PCP mode.

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2018-07-16 analytics fw-nat report(1)

NAME
scheduled-report - Configure scheduled reports for firewall NAT.

MODULE
analytics fw-nat

SYNTAX
Configure the scheduled-report component within the analytics fw-nat module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
 email-addresses [none | add | delete | modify |
 replace-all-with] { email-address [string] }
 first-time [date]
 frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
 include-total [enabled | disabled]
 multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
 }
 predefined-report-name [name]
 smtp-config [name]
 device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the firewall NAT module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the firewall NAT scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help

manual for analytics fw-nat report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics fw-nat report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

BIG-IP 2018-07-analytics fw-nat scheduled-report(1)

analytics global-settings

NAME
global-settings - set up global analytics parameters.

MODULE
analytics global-settings

SYNTAX
List or set up parameters related to analytics data publishing using the syntax shown in the following sections.

LIST GLOBAL SETTINGS

list analytics global-settings [all-properties | non-default-properties | one-line | recursive]

GLOBAL PUBLISHING SETTINGS

modify avrd-interval [value]
modify avrd-debug-mode [disabled | enabled]
modify disable-all-internal-logging [disabled | enabled]

HSL PUBLISHER

modify external-logging-publisher [publisher name | none]

OFFBOX SETTINGS

modify offbox-protocol [ecm-tm | hsl | none | tcp]
modify offbox-tcp-addresses
[add | delete | none | replace-all-with] { list of IP addresses... }
modify offbox-tcp-port [value]
modify use-offbox [disabled | enabled]

DESCRIPTION

Use the analytics global-settings command to list or modify the following global analytics settings:

- o avrd-interval - analytics data collection interval in seconds. If this interval is different from the default value (300 seconds), internal statistics are not collected unless avrd-debug-mode is set to enabled. Minimal interval is 20 seconds, maximum interval is 300 seconds.
- o avrd-debug-mode - enable or disable debug mode. If debug mode is disabled (by default), internal statistics are collected only if avrd-interval is set to the default value (300 seconds).

- o `disable-all-internal-logging` - when it is enabled, internal statistics are never collected, regardless of `avrd-interval` and `avrd-debug-mode` settings.
- o `external-logging-publisher` - choose which logging publisher will be used for the external HSL protocol. Relevant when `offbox-protocol` is set to `'hsl'`.
- o `offbox-protocol` - protocol for communication with offbox analytics application. The protocol can be defined as one of the following four options: `'hsl'` - (High Speed Logging) a protocol based on UDP or TCP; `'tcp'` - the proprietary TCP-based protocol; `'ecm-tm'` - a protocol based on Google RPC (`grpc`); and `'none'`. Note: `'ecm-tm'` is the recommended option. Note: If `'none'` is chosen, the analytics module does not try to connect to the offbox analytics application.
- o `offbox-tcp-addresses` - server IP addresses used only if the `'tcp'` protocol is chosen. Multiple IP addresses are supported. If more than one IP address is configured, the analytics module first tries to connect to the first IP address in the list. If the connection can't be established, it tries the next IP address, and so on.
- o `offbox-tcp-port` - server TCP port for the server IP addresses used only if `'tcp'` protocol is chosen. If multiple tcp addresses are configured they all use the same port.
- o `use-offbox` - enables and disables all communication with the offbox application on global level.

EXAMPLES

Display all current analytics global settings:

```
list analytics global-settings all-properties
```

Enable the analytics module to communicate with an offbox application using the `'tcp'` protocol. In this example, the offbox application IP addresses are 192.168.1.1 and 192.168.1.2, TCP port is - 3344 :

```
modify analytics global-settings offbox-tcp-addresses
add { 192.168.1.1 192.168.1.2 }
modify analytics global-settings offbox-tcp-port 3344
modify analytics global-settings offbox-protocol tcp
modify analytics global-settings use-offbox enabled
```

Create an analytics report every 20 seconds. Note: Since it has a big performance impact, this should be configured for debugging purposes only.

```
modify analytics global-setting avrd-debug-mode enabled
modify analytics global-setting avrd-interval 20
```

DESCRIPTION

Use this command to generate HTTP analytics reports. You can generate an HTTP analytics report for the following entities:

- o activity-type - Activity type.
- o application - Application services.

- o attack-id - Application/L7 DoS Attack ID.
- o behavioral-signature - Behavioral signature.
- o bot-defense-reason - BOT defense reason.
- o browser - Browser.
- o client-ip - A single client identified by an IP address.
- o client-subnet - Client subnet.
- o country - A country from which HTTP/HTTPS traffic was sent to each of the virtual servers.
- o country-code - Country code from which HTTP/HTTPS traffic was sent to each of the virtual servers.
- o device-id - Device ID.
- o dos-mobile-app-client-type - DoS mobile application client type.
- o dos-mobile-app-display-name - DoS mobile application display name.
- o dos-mobile-app-emulation-mode - DoS mobile application emulation mode.
- o dos-mobile-app-human-behavior - DoS mobile application human behavior.
- o dos-mobile-app-jail-break - DoS mobile application jail break.
- o dos-mobile-app-version-name - DoS mobile application version name.
- o dos-profile - DoS Profile.
- o dosl7-bot-signature - DoS Layer 7 bot signature.
- o dosl7-bot-signature-category - DoS Layer 7 bot category.
- o http-method - Method.
- o http-transaction-outcome - HTTP Transaction outcomes (Blocked/Dropped/Passthrough/etc.)
- o mitigation - Mitigation.
- o os - OS name.
- o pool-member - Pool members.
- o response-code - An HTTP response code that was sent back to the client.
- o suspected-ip - Suspected address IP.
- o trigger - Trigger.
- o url - A URL accessed by HTTP or HTTPS.
- o user-agent - A browser identifier sent by the client's browser as part of the request for URL.
- o vector - Attack vector.
- o virtual - Virtual servers.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics http report view-by virtual measures {average-tps} limit 20
```

Gets the average tps of 20 virtual servers (unordered).

```
show analytics http report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } }
```

Gets the average tps of the top 20 virtual servers.

```
show analytics http report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } } range now-3d--now
```

Gets the average tps of the top 20 virtual servers from the last three days.

```
show analytics http report view-by virtual drilldown { { entity application values { app } } { entity pool-member values { p1 p2 } } } range now-4d--now-2d measures {average-tps} limit 10 order-by { { measure average-tps sort-type DESC } }
```

Gets the average tps of the top 10 virtual servers (ordered by average tps) on app iApp (out of several monitored) on pool members p1 and p2 (out of five monitored p1-p5) in the interval ranging from two to four days ago.

```
show analytics http report view-by response-code drilldown { { entity virtual values { v1 } } } measures { transactions }
```

Gets a distribution of requests per response code on virtual v1.

```
show analytics http report view-by country drilldown { { entity
```

```
application values { app } } } measures { average-concurrent-sessions
average-sessions } order-by { { measure average-sessions sort-type DESC
} } limit 5
```

Gets the new sessions and average concurrent sessions of the top five countries, ordered by the average concurrent sessions on the application app.

```
show analytics http report view-by client-ip drilldown { { entity
virtual values { v1 } } } measures { max-page-load-time } limit 1
```

Gets the client IP address with the worst page load time.

```
show analytics http report view-by application drilldown { { entity
pool-member values { p1 p2 } } } measures { transactions } order-by { {
measure transactions } } range now-7d--now
```

Gets the distribution of requests per application on pool members p1 and p2 ordered by the number of requests during the last week.

```
save analytics http report view-by virtual measures {average-tps} limit
20 order-by { { measure average-tps sort-type desc } } format pdf file
report.pdf
```

Gets the average tps of the top 20 virtual servers and exports to a PDF file on the BIG-IP system.

```
save analytics http report view-by virtual measures {average-tps} limit
20 order-by { { measure average-tps sort-type desc } } format csv-
aggregated file report.csv
```

Gets the average tps of the top 20 virtual servers and exports to a CSV file on the BIG-IP system.

```
save analytics http report view-by virtual measures {average-tps} limit
20 order-by { { measure average-tps sort-type desc } } format csv-time-
series file report.csv
```

Gets the average tps over time of the top 10 virtual servers and exports to a CSV file on the BIG-IP system.

```
send-mail analytics http report view-by virtual measures {average-tps}
limit 20 order-by { { measure average-tps sort-type desc } } format
pdf email-addresses { some.one@someaddress.com }
```

Gets the average tps over time of the top 10 virtual servers and sends out an email containing the report as a PDF.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The default value is transactions. The options are:

average-concurrent-sessions

The average number of concurrent sessions for each entity.

average-new-sessions

The average number of new sessions for each entity.

average-page-load-time

The average client page load time for each entity.

average-request-throughput

The average request throughput for each entity.

average-response-throughput

The average response throughput for each entity.

average-server-latency
The average server latency for each entity.

average-tps
The average number of transactions per second for each entity.

client-side-sampled-transactions
The number of transactions sampled for client side page load time.

max-page-load-time
The maximum client page load time for each entity.

max-request-throughput
The maximum request throughput for each entity.

max-response-throughput
The maximum response throughput for each entity.

max-server-latency
The maximum server latency for each entity.

max-tps
The maximum number of transactions per second for each entity.

transactions
The absolute number of transactions for each entity.

min-server-latency
The minimum server latency for each entity.

average-request-size
The average request size for each entity.

average-response-size
The average response size for each entity.

average-application-response-time
The average application response time for each entity.

min-application-response-time
The minimum application response time for each entity.

max-application-response-time
The maximum application response time for each entity.

average-client-ttfb
The average client TTFB for each entity.

min-client-ttfb
The minimum client TTFB for each entity.

max-client-ttfb
The maximum client TTFB for each entity.

average-clientside-network-latency
The average client-side network latency for each entity.

min-clientside-network-latency
The minimum client-side network latency for each entity.

max-clientside-network-latency
The maximum client-side network latency for each entity.

average-serverside-network-latency
The average server-side network latency for each entity.

min-serverside-network-latency
The minimum server-side network latency for each entity.

max-serverside-network-latency
The maximum server-side network latency for each entity.

average-request-duration
The average request duration for each entity.

min-request-duration
The minimum request duration for each entity.

max-request-duration
The maximum request duration for each entity.

average-response-duration
The average response duration for each entity.

min-response-duration
The minimum response duration for each entity.

max-response-duration
The maximum response duration for each entity.

attacks-count
The total number of attack for each entity.

valid
The total number of valid transactions for each entity.

average-valid-tps
The average number of valid transactions for each entity.

mitigated
The total number of mitigated transaction for each entity.

average-mitigated-tps
The average number of mitigated transaction for each entity.

blocked
The total number of blocked transactions for each entity.

average-blocked-tps
The average number of blocked transactions for each entity.

incomplete
The total number of incomplete transactions for each entity.

average-incomplete-tps
The average number of incomplete transactions for each entity.

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The default value for measures is previously chosen measures. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics http scheduled-report

NAME
scheduled-report - Configure scheduled reports for HTTP.

MODULE
analytics http

SYNTAX
Configure the scheduled-report component within the analytics http module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
email-addresses [none | add | delete | modify |
replace-all-with] { email-address [string] }
first-time [date]
frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the HTTP module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-  
report-name "Top blocked URLs" frequency every-6-hours email-addresses  
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the HTTP scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics http report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics http report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics ip-intelligence scheduled-report

NAME
scheduled-report - Configure scheduled reports for IP intelligence (DWBL).

MODULE
analytics ip-intelligence

SYNTAX
Configure the scheduled-report component within the analytics ip-intelligence module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
email-addresses [none | add | delete | modify |
replace-all-with] { email-address [string] }
first-time [date]
frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the IP intelligence (DWBL) module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the IP intelligence (DWBL) scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with **predefined-report-name**. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics ip-intelligence report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics ip-intelligence report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with **multi-leveled-report**.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

  {
    measure [ measure name ]
    sort-type [ asc / desc ]
  } ...
}
range [date range]
smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate ip-layer analytics reports. You can generate a IP-layer analytics report for the following entities:

- o ip - IP version (IPV4 / IPV6)

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics ip-layer report view-by ip
```

```
show analytics ip-layer report view-by ip drilldown { { entity ip
values { IP-V4 } } }
```

```
send-mail analytics ip-layer report view-by ip measures { dropped-pkts
} limit 20 order-by { { measure dropped-pkts sort-type desc } } format
pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

transmitted-pkts

The total number of transmitted packets for the selected filter (entity).

received-pkts

The total number of received packets for the selected filter (entity).

dropped-pkts

The total number of dropped packets for the selected filter (entity).

err-invalid-len

The total number of error invalid length for the selected filter (entity).

err-memory

The total number of error memory for the selected filter (entity).

err-retransmitted

The total number of error retransmitted for the selected filter (entity).

err-protocol

The total number of error protocol for the selected filter (entity).

err-options

The total number of error options for the selected filter (entity).

err-checksum

The total number of error checksum for the selected filter (entity).

received-frags

The total number of received fragments for the selected filter (entity).

received_dropped_frags

The total number of received dropped fragments for the selected filter (entity).

transmitted-frags

The total number of transmitted fragments for the selected filter (entity).

transmitted-dropped-frags

The total number of transmitted dropped fragment for the selected filter (entity).

reassembled-frags

The total number of reassembled fragment for the selected filter (entity).

reassembled-dropped-frags

The total number of 'too long' reassembled dropped fragment for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2015-07-22 analytics ip-layer report(1)

analytics ip-layer scheduled-report

NAME

scheduled-report - Configure scheduled reports for IP layer.

MODULE

analytics ip-layer

SYNTAX

Configure the scheduled-report component within the analytics ip-layer module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the IP layer module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the IP layer scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics ip-layer report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics ip-layer report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate lsn-pool analytics reports. You can generate a LSN analytics report for the following entities:

- o lsn-pool - LSN Pool translation statistics

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics lsn-pool report view-by lsn-pool
```

```
send-mail analytics lsn-pool report view-by lsn-pool measures { active-
translations } limit 20 order-by { { measure active-translations sort-
type desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics

report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

active-translations

The average number of active LSN translations for the selected filter (entity).

translation-request

The total number of LSN translation requests for the selected filter (entity).

translation-failure

The total number of failed LSN translations for the selected filter (entity).

translation-from-backup

The total number of LSN translations using the backup pool for selected filter (entity). Only applies to LSN Pool in Deterministic NAT mode.

active-pb

The average number of active port-blocks for the selected filter (entity). Only applies to LSN Pool in PBA mode.

pb-allocations

The total number of port-block allocations for the selected filter (entity). Only applies to LSN Pool in PBA mode.

pb-freed

The total number of port-block deallocations for the selected filter (entity). Only applies to LSN Pool in PBA mode.

zombie-block-created

The total number of zombie blocks created for the selected filter (entity). Only applies to LSN Pool in PBA mode.

zombie-block-deleted

The total number of zombie blocks deleted for the selected filter (entity). Only applies to LSN Pool in PBA mode.

active-pb-clients-reached-limit

The average number of port-block clients that have reached the port-block limit for the selected filter (entity). Only applies to LSN Pool in PBA mode.

pb-client-reached-limit

The total number of port-block clients that have reached the port-block limit for the selected filter (entity). Only applies to LSN Pool in PBA mode.

pcp-requests

The total number of PCP requests for the selected filter (entity). Only applies to LSN Pool with PCP profile.

pcp-responses

The total number of PCP responses for the selected filter (entity). Only applies to LSN Pool with PCP profile.

pcp-errors

The total number of PCP errors for the selected filter (entity). Only applies to LSN Pool with PCP profile.

log-attempts
The total number of logging attempts for the selected filter (entity). Only applies to LSN Pool with Log publisher attached.

log-failures
The total number of logging failures for the selected filter (entity). Only applies to LSN Pool with Log publisher attached.

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics lsn-pool scheduled-report

NAME
scheduled-report - Configure scheduled reports for LSN pool.

MODULE
analytics lsn-pool

SYNTAX
Configure the scheduled-report component within the analytics lsn-pool module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
 email-addresses [none | add | delete | modify |
 replace-all-with] { email-address [string] }
 first-time [date]
 frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
 include-total [enabled | disabled]
 multi-leveled-report {
 chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
 limit [number of rows]
 time-diff [last-hour | last-day | last-week | last-month | last-year]
 view-by { entity name [string] }
 measures [none | add | delete | modify | replace-all-with] { measure name [string] }
 }
 predefined-report-name [name]
 smtp-config [name]
 device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the LSN pool module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the LSN pool scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics lsn-pool report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics lsn-pool report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate memory analytics reports. You can generate a memory analytics report for the following entities:

- o slot - Slot ID

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics memory report view-by slot
```

```
show analytics memory report view-by slot drilldown { { entity slot  
values { IP-V4 } } }
```

```
send-mail analytics memory report view-by slot measures { dropped-pkts  
} limit 20 order-by { { measure host-usage sort-type desc } } format  
pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

tmm-total-ram The average of total TMM memory for the selected filter (entity).

tmm-used-ram The average of used TMM memory for the selected filter (entity).

tmm-free-ram The average of free TMM memory for the selected filter (entity).

other-total-ram The average of total other (daemons and kernel) memory for the selected filter (entity).

other-used-ram The average of used other (daemons and kernel) memory for the selected filter (entity).

other-free-ram The average of free other (daemons and kernel) memory for the selected filter (entity).

system-total-ram The average of total system memory for the selected filter (entity).

system-used-ram The average of used system memory for the selected filter (entity).

system-free-ram The average of free system memory for the selected filter (entity).

swap-total-ram The average of total swap memory for the selected filter (entity).

swap-used-ram The average of used swap memory for the selected filter (entity).

swap-free-ram The average of free swap memory for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2015-07-22 analytics memory report(1)

analytics memory scheduled-report

NAME

scheduled-report - Configure scheduled reports for memory.

MODULE

analytics memory

SYNTAX

Configure the scheduled-report component within the analytics memory module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the memory module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the memory scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics memory report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics memory report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

DESCRIPTION

Use this command to generate network firewall analytics reports. You can generate a network firewall analytics report for the following entities:

- o action - Action taken (allowed/dropped).
- o acl-enforced-application - Application services (ACL - Enforced).
- o acl-enforced-destination-ip - Destination IP Address (ACL - Enforced).
- o acl-enforced-destination-port - Destination IP Port (ACL - Enforced).
- o acl-enforced-policy - Policy (ACL - Enforced).
- o acl-enforced-rule-action - Rule Action (ACL - Enforced).
- o acl-enforced-rule-context - Rule Context (ACL - Enforced).
- o acl-enforced-rule-context-type - Rule Context Type (ACL - Enforced).
- o acl-enforced-rule - Rule (ACL - Enforced).
- o acl-enforced-self-ip - Self IP Address (ACL - Enforced).
- o acl-enforced-server-ip - Server IP Address (ACL - Enforced).
- o acl-enforced-source-ip - Source IP Address (ACL - Enforced).
- o acl-enforced-source-port - Source IP Port (ACL - Enforced).
- o acl-enforced-translation-pool - Translation Pool (ACL - Enforced).
- o acl-enforced-translation-type - Translation Type (ACL - Enforced).
- o acl-enforced-vlan - VLAN (ACL - Enforced).
- o acl-mgmt-application - Application services (ACL - Management).
- o acl-mgmt-destination-ip - Destination IP Address (ACL - Management).
- o acl-mgmt-destination-port - Destination IP Port (ACL - Management).
- o acl-mgmt-rule-action - Rule Action (ACL - Management).
- o acl-mgmt-rule-context - Rule Context (ACL - Management).
- o acl-mgmt-rule - Rule (ACL - Management).
- o acl-mgmt-source-ip - Source IP Address (ACL - Management).
- o acl-mgmt-source-port - Source IP Port (ACL - Management).
- o acl-staged-application - Application services (ACL - Staged).
- o acl-staged-destination-ip - Destination IP Address (ACL - Staged).
- o acl-staged-destination-port - Destination IP Port (ACL - Staged).
- o acl-staged-policy - Policy (ACL - Staged).
- o acl-staged-rule-action - Rule Action (ACL - Staged).
- o acl-staged-rule-context - Rule Context (ACL - Staged).
- o acl-staged-rule-context-type - Rule Context Type (ACL - Staged).
- o acl-staged-rule - Rule (ACL - Staged).

- o acl-staged-self-ip - Self IP Address (ACL - Staged).
- o acl-staged-server-ip - Server IP Address (ACL - Staged).
- o acl-staged-source-ip - Source IP Address (ACL - Staged).
- o acl-staged-source-port - Source IP Port (ACL - Staged).
- o acl-staged-translation-pool - Translation Reason (ACL - Staged).
- o acl-staged-translation-type - Translation Type (ACL - Staged).
- o acl-staged-vlan - VLAN (ACL - Staged).
- o 1314-errors-action - Network firewall errors action.
- o 1314-errors-destination-ip - Destination IP address (Network firewall errors).
- o 1314-errors-error-reason - Network firewall error reason.
- o 1314-errors-network-protocol - Destination port (Network protocol).
- o 1314-errors-source-ip - Source IP address (Network firewall errors).
- o 1314-errors-vlan - VLAN (Network firewall errors).

EXAMPLES

```
show analytics network report view-by acl-enforced-rule

show analytics network report view-by acl-staged-vlan drilldown { {
entity acl-staged-destination-port values { 80 } } }

send-mail analytics network report view-by acl-mgmt-source-ip limit 20
format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

acl-matches
The total number of ACL rule matches. Applicable only to view-by entities starting with "acl-".

errors
The total number of firewall errors. Applicable only to view-by entities starting with "1313-errors-".

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2013-04-10 analytics network report(1)

analytics network scheduled-report

NAME

scheduled-report - Configure scheduled reports for network.

MODULE

analytics network

SYNTAX

Configure the scheduled-report component within the analytics network module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the network module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the network scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics network report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics network report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics network stale-rules

NAME

stale-rules - Displays a network firewall stale rules report.

MODULE

analytics network

SYNTAX

Show an analytics network stale-rules report using the syntax shown in the following sections.

DISPLAY

show stale-rules type [enforced | staged]

options:

```
drilldown {
  {
entity [ context | policy | rule-name ]
values
{
  [value ...]
}
} ...
}

field-fmt
first-rule-number [ value ]
number-of-rules [ value ]
range [ date range ]
```

DESCRIPTION

Use this command to generate network firewall stale rules reports. A stale rule is one that has had not hits, or very few hits, over a specified time period. The report is displayed in order from the least-hit rules (including rules with no hits) to the most hit rules. You can generate a stale rules report for either enforced or staged rules.

EXAMPLES

```
show analytics network stale-rules type enforced
```

Shows a stale rules report for enforced rules (either inline or not).

```
show analytics network stale-rules type staged drilldown { { entity
context values { /Common/virtual_server_1 } } }
```

Shows a stale rules report for staged rules in the context of the virtual server /Common/virtual_server_1

```
show analytics network stale-rules type enforced number-of-rules 100
range now-1w
```

Shows a stale rules report for enforced rules. 100 rules are shown in the report. This report is shown for the last week (including the last day).

```
show analytics network stale-rules type enforced first-rule-number 10
number-of-rules 100 range now-1w
```

Shows a stale rules report for enforced rules. The first least hit 9 rules are skipped, and 100 rules are shown in the report. This report is shown for the last week (including the last day).

```
show analytics network stale-rules type enforced first-rule-number 10
number-of-rules 100 range now-1d--now-1w
```

Shows a stale rules report for enforced rules. The first least hit 9 rules are skipped, and 100 rules are shown in the report. This report is shown for the last week, excluding the last day.

OPTIONS

drilldown

Specifies specific entities that are used as a filter.

field-fmt

Shows statistics in field format for the specified items.

first-rule-number

Specifies the first rule number being displayed (rules are ordered by hit count in an ascending order).

number-of-rules

Specifies the maximum number of firewall rules being displayed in the output result set. The default value is 10.

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

SEE ALSO

 sort-type [asc / desc]
 } ...
}
range [date range]
smtp-config-override [smtp configuration object name]

DESCRIPTION
Use this command to generate pem analytics reports. You can generate a PEM analytics report for the following entities:

- o application - Classification application
- o category - Classification category
- o url-category - URL category
- o policy - Classification application policy
- o service - Forwarding service (endpoint)
- o action - PEM action (Gate, Forward, ICAP, Modify HTTP header, etc...)
- o tower - Tower the subscriber communicates from
- o subscribers - Subscriber summary statistics
- o subscriber-name - Subscriber name
- o ip-list - IP address list
- o device-name - Device name
- o device-os - Device operating system
- o called-station - Called station
- o calling-station - Calling station
- o subscriber-type - Subscriber type
- o user-name - User Name

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics pem report view-by category
```

```
show analytics pem report view-by category drilldown { { entity policy
values { Some_Policy_Name } } }
```

```
send-mail analytics pem report view-by tower measures { total_bytes_in
} limit 20 order-by { { measure total_bytes_in sort-type desc } }
format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

hitcount

The total number of classified flows for the selected filter (entity).

total-bytes-in

The total number of bytes received for the selected filter (entity).

total-bytes-out

The total number of bytes sent for the selected filter (entity).

total-flows-opened
The total number of flows (classified and non-classified) for the selected filter (entity).

total-flows-closed
The total number of closed flows for the selected filter (entity).

total-subscribers-login
The total number of login events for the selected filter (entity).

total-subscribers-logout
The total number of logout events for the selected filter (entity).

avg-distinct-apps
The average number of distinct applications for the selected filter (entity).

avg-distinct-categories
The average number of distinct categories for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2015-07-22 analytics pem report(1)

analytics pem scheduled-report

NAME
scheduled-report - Configure scheduled reports for PEM.

MODULE
analytics pem

SYNTAX
Configure the scheduled-report component within the analytics pem module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
```

```
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE  
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the PEM module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-  
report-name "Top blocked URLs" frequency every-6-hours email-addresses  
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the PEM scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics pem report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics pem report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the pool traffic module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the pool traffic scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
 First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
 The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
 Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
 Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
 A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics pool-traffic report.

limit
 The number of view-by entities displayed in the scheduled report.

time-diff
 The time range for the report.

view-by
 The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics pool-traffic report.

measures
 The measures which are available for the selected entities.

predefined-report-name
 Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config
 Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
 Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the process CPU module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the process CPU scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics proc-cpu report.

```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the protocol security HTTP (PSM HTTP) module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
```

```
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the protocol security HTTP (PSM HTTP) scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics protocol-security-http report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics protocol-security-http report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

BIG-IP analytics0protocol-security-http scheduled-report(1)

NAME report - Displays a Protocol Security analytics report.

MODULE analytics protocol-security

SYNTAX Show, save, or send an analytics protocol-security report using the syntax shown in the following sections.

```
DISPLAY
show report view-by [ application | virtual-server | ip | violation| request-type | protocol-type ]
options:
  drilldown {
  {
entity [ application | virtual-server | ip | violation| request-type | protocol-type ]
values
{
  [value ...]
}
} ...
}
field-fmt
include-total
include-others
limit [number of rows]
measures {
  [measure name ...]
}
order-by {
  {
    measure [ measure name ]
    sort-type [ asc / desc ]
  } ...
}
range [date range]

SAVE
save report view-by [ application | virtual-server | ip | violation| request-type | protocol-type ]
options:
  drilldown {
  {
entity [ application | virtual-server | ip | violation| request-type | protocol-type ]
values
{
  [value ...]
}
} ...
}
file [ file name ]
format [ csv-aggregated | csv-time-series | pdf ]

  {
    measure [ measure name ]
    sort-type [ asc / desc ]
  } ...
}
range [date range]
smtp-config-override [ smtp configuration object name ]
```

DESCRIPTION

Use this command to generate protocol-security analytics reports. You can generate a protocol-security analytics report for the following entities:

- o application - Application services.

- o virtual-server - Virtual servers.
- o ip - Source IP addresses.
- o violation - Violation types.
- o protocol-type - Protocol type (HTTP/FTP/SMTP)
- o request-type - PRequest type (Legal or Alarmed/Blocked/Dropped)

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics protocol-security report view-by protocol-type

show analytics protocol-security report view-by request-type drilldown
{ { entity protocol-type values { HTTP } } }

send-mail analytics protocol-security report view-by protocol-type
measures {transactions} limit 20 order-by { { measure transactions
sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the manpage for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

requests
Request count.

occurrences
Number of occurrences for the selected filter (relevant for violation entity only)

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics protocol-security scheduled-report

NAME

scheduled-report - Configure scheduled reports for protocol security (PSM).

MODULE

analytics protocol-security

SYNTAX

Configure the scheduled-report component within the analytics protocol-security module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the protocol security (PSM) module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the protocol security (PSM) scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that

the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics protocol-security report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics protocol-security report.

measures
The measures which are available for the selected entities.

predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

DESCRIPTION

Use this command to generate HTTP analytics reports. You can generate an HTTP analytics report for the following entities:

- o activity-type - Activity type.
- o application - Application services.

- o attack-id - Application/L7 DoS Attack ID.
- o behavioral-signature - Behavioral signature.
- o bot-defense-reason - BOT defense reason.
- o browser - Browser.
- o client-ip - A single client identified by an IP address.
- o client-subnet - Client subnet.
- o country - A country from which HTTP/HTTPS traffic was sent to each of the virtual servers.
- o country-code - Country code from which HTTP/HTTPS traffic was sent to each of the virtual servers.
- o device-id - Device ID.
- o dos-mobile-app-client-type - DoS mobile application client type.
- o dos-mobile-app-display-name - DoS mobile application display name.
- o dos-mobile-app-emulation-mode - DoS mobile application emulation mode.
- o dos-mobile-app-human-behavior - DoS mobile application human behavior.
- o dos-mobile-app-jail-break - DoS mobile application jail break.
- o dos-mobile-app-version-name - DoS mobile application version name.
- o dos-profile - DoS Profile.
- o dosl7-bot-signature - DoS Layer 7 bot signature.
- o dosl7-bot-signature-category - DoS Layer 7 bot category.
- o http-method - Method.
- o http-transaction-outcome - HTTP Transaction outcomes (Blocked/Dropped/Passthrough/etc.)
- o mitigation - Mitigation.
- o os - OS name.
- o pool-member - Pool members.
- o response-code - An HTTP response code that was sent back to the client.
- o suspected-ip - Suspected address IP.
- o trigger - Trigger.
- o url - A URL accessed by HTTP or HTTPS.
- o user-agent - A browser identifier sent by the client's browser as part of the request for URL.
- o vector - Attack vector.
- o virtual - Virtual servers.

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics report view-by virtual measures {average-tps} limit 20
```

Gets the average tps of 20 virtual servers (unordered).

```
show analytics report view-by virtual measures {average-tps} limit 20
order-by { { measure average-tps sort-type desc } }
```

Gets the average tps of the top 20 virtual servers.

```
show analytics report view-by virtual measures {average-tps} limit 20
order-by { { measure average-tps sort-type desc } } range now-3d--now
```

Gets the average tps of the top 20 virtual servers from the last three days.

```
show analytics report view-by virtual drilldown { { entity application
values { app } } { entity pool-member values { p1 p2 } } } range
now-4d--now-2d measures {average-tps} limit 10 order-by { { measure
average-tps sort-type DESC } }
```

Gets the average tps of the top 10 virtual servers (ordered by average tps) on app iApp (out of several monitored) on pool members p1 and p2 (out of five monitored p1-p5) in the interval ranging from two to four days ago.

```
show analytics report view-by response-code drilldown { { entity
virtual values { v1 } } } measures { transactions }
```

Gets a distribution of requests per response code on virtual v1.

```
show analytics report view-by country drilldown { { entity application
values { app } } } measures { average-concurrent-sessions average-
sessions } order-by { { measure average-sessions sort-type DESC } }
```

limit 5

Gets the new sessions and average concurrent sessions of the top five countries, ordered by the average concurrent sessions on the application app.

```
show analytics report view-by client-ip drilldown { { entity virtual values { v1 } } } measures { max-page-load-time } limit 1
```

Gets the client IP address with the worst page load time.

```
show analytics report view-by application drilldown { { entity pool-member values { p1 p2 } } } measures { transactions } order-by { { measure transactions } } range now-7d--now
```

Gets the distribution of requests per application on pool members p1 and p2 ordered by the number of requests during the last week.

```
save analytics report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } } format pdf file report.pdf
```

Gets the average tps of the top 20 virtual servers and exports to a PDF file on the BIG-IP system.

```
save analytics report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } } format csv-aggregated file report.csv
```

Gets the average tps of the top 20 virtual servers and exports to a CSV file on the BIG-IP system.

```
save analytics report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } } format csv-time-series file report.csv
```

Gets the average tps over time of the top 10 virtual servers and exports to a CSV file on the BIG-IP system.

```
send-mail analytics report view-by virtual measures {average-tps} limit 20 order-by { { measure average-tps sort-type desc } } format pdf email-addresses { some.one@someaddress.com }
```

Gets the average tps over time of the top 10 virtual servers and sends out an email containing the report as a PDF.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The default value is transactions. The options are:

average-concurrent-sessions

The average number of concurrent sessions for each entity.

average-new-sessions

The average number of new sessions for each entity.

average-page-load-time

The average client page load time for each entity.

average-request-throughput

The average request throughput for each entity.

average-response-throughput

The average response throughput for each entity.

average-server-latency
The average server latency for each entity.

average-tps
The average number of transactions per second for each entity.

client-side-sampled-transactions
The number of transactions sampled for client side page load time.

max-page-load-time
The maximum client page load time for each entity.

max-request-throughput
The maximum request throughput for each entity.

max-response-throughput
The maximum response throughput for each entity.

max-server-latency
The maximum server latency for each entity.

max-tps
The maximum number of transactions per second for each entity.

transactions
The absolute number of transactions for each entity.

min-server-latency
The minimum server latency for each entity.

average-request-size
The average request size for each entity.

average-response-size
The average response size for each entity.

average-application-response-time
The average application response time for each entity.

min-application-response-time
The minimum application response time for each entity.

max-application-response-time
The maximum application response time for each entity.

average-client-ttfb
The average client TTFB for each entity.

min-client-ttfb
The minimum client TTFB for each entity.

max-client-ttfb
The maximum client TTFB for each entity.

average-clientside-network-latency
The average client-side network latency for each entity.

min-clientside-network-latency
The minimum client-side network latency for each entity.

max-clientside-network-latency
The maximum client-side network latency for each entity.

average-serverside-network-latency
The average server-side network latency for each entity.

min-serverside-network-latency
The minimum server-side network latency for each entity.

max-serverside-network-latency
The maximum server-side network latency for each entity.

average-request-duration
The average request duration for each entity.

min-request-duration
The minimum request duration for each entity.

max-request-duration
The maximum request duration for each entity.

average-response-duration
The average response duration for each entity.

min-response-duration
The minimum response duration for each entity.

max-response-duration
The maximum response duration for each entity.

attacks-count
The total number of attack for each entity.

valid
The total number of valid transactions for each entity.

average-valid-tps
The average number of valid transactions for each entity.

mitigated
The total number of mitigated transaction for each entity.

average-mitigated-tps
The average number of mitigated transaction for each entity.

blocked
The total number of blocked transactions for each entity.

average-blocked-tps
The average number of blocked transactions for each entity.

incomplete
The total number of incomplete transactions for each entity.

average-incomplete-tps
The average number of incomplete transactions for each entity.

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The default value for measures is previously chosen measures. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2018-07-16 analytics report(1)

analytics sip-dos scheduled-report

NAME
scheduled-report - Configure scheduled reports for SIP DoS.

MODULE
analytics sip-dos

SYNTAX
Configure the scheduled-report component within the analytics sip-dos module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the SIP DoS module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-  
report-name "Top blocked URLs" frequency every-6-hours email-addresses  
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the SIP DoS scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics sip-dos report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics sip-dos report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics sip report

NAME
report - Displays a SIP analytics report.

MODULE
analytics sip

SYNTAX
Show, save or send an analytics sip report using the syntax shown in the following sections.

DISPLAY
show report view-by [activity-type | application | attack-id | callee | caller | client-ip | country | country-code | options:
drilldown {
 {
entity [activity-type | application | attack-id | callee | caller | client-ip | country | country-code | dos-profile values
 {
 [value ...]
 }
 } ...
 }
field-fmt
include-total
include-others
limit [number of rows]
measures {
 [measure name ...]
}
order-by {
 {
 measure [measure name]
 sort-type [asc | desc]
 } ...
}
range [date range]

SAVE
save report view-by [activity-type | application | attack-id | callee | caller | client-ip | country | country-code | options:
drilldown {
 {
entity [activity-type | application | attack-id | callee | caller | client-ip | country | country-code | dos-profile values
 {
 [value ...]
 }
 } ...
 }
file [file name]
format [csv-aggregated | csv-time-series | pdf]
include-total
include-others
limit [number of rows]
measures {
 [measure name ...]
}
order-by {
 {
 measure [measure name]
 sort-type [asc | desc]
 } ...
}
range [date range]

SEND
send-mail report view-by [activity-type | application | attack-id | callee | caller | client-ip | country | country-c options:
drilldown {
 {
entity [activity-type | application | attack-id | callee | caller | client-ip | country | country-code | dos-profile values
 {
 [value ...]
 }
 } ...
 }
email-addresses {
 [email address ...]
}
format [csv-aggregated | csv-time-series | pdf]
include-total
include-others
limit [number of rows]
measures {
 [measure name ...]

```
}
order-by {
  {
    measure [ measure name ]
    sort-type [ asc | desc ]
  } ...
}
range [date range]
smtp-config-override [ smtp configuration object name ]
```

DESCRIPTION

Use this command to generate SIP DoS analytics reports. You can generate a SIP DoS prevention analytics report for the following entities:

- o activity-type - Activity type.
- o application - Application services (iApp).
- o attack-id - DoS attack ID.
- o callee - Callee.
- o caller - Caller.
- o client-ip - Source IP Address.
- o country - Country.
- o country-code - Country code.
- o dos-profile - DoS profile.
- o mitigation - Mitigation.
- o sip-method - Method.
- o sip-transaction-outcome - Transaction outcome.
- o suspected-ip - Suspected IP Address.
- o trigger - Trigger.
- o vector - Attack vector.
- o virtual - Virtual server.
- o vlan - VLAN.

EXAMPLES

```
show analytics sip report view-by attack-id

show analytics sip report view-by vector drilldown { { entity method
values { ACK } } }

send-mail analytics sip report view-by callee limit 20 format pdf
email-addresses { some.one@someaddress.com }
```

For more syntactical examples see manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file
Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. This option must be used with the drilldown option. You can also use it along with include-others.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

attacks-count
The total number of attacks for the selected view-by entity.

requests-count
The total number of requests that were received by the virtual server(/s)s

requests-per-sec
The average number of requests that were received by the virtual server(/s)s

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2018-07-16 analytics sip report(1)

analytics sip scheduled-report

NAME

scheduled-report - Configure scheduled reports for SIP.

MODULE

analytics sip

SYNTAX

Configure the scheduled-report component within the analytics sip module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the SIP module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the SIP scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics sip report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics sip report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

SEE ALSO

analytics ssl-orchestrator scheduled-report

NAME
scheduled-report - Configure scheduled reports for SSL orchestrator.

MODULE
analytics ssl-orchestrator

SYNTAX
Configure the scheduled-report component within the analytics ssl-orchestrator module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
 email-addresses [none | add | delete | modify |
 replace-all-with] { email-address [string] }
 first-time [date]
 frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
 include-total [enabled | disabled]
 multi-leveled-report {
 chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
 limit [number of rows]
 time-diff [last-hour | last-day | last-week | last-month | last-year]
 view-by { entity name [string] }
 measures [none | add | delete | modify | replace-all-with] { measure name [string] }
 }
 predefined-report-name [name]
 smtp-config [name]
 device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the SSL orchestrator module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the SSL orchestrator scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition

contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics ssl-orchestrator report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics ssl-orchestrator report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

      sort-type [ asc / desc ]
    } ...
  }
  range [date range]

  SEND
  send-mail report view-by [ ssl_bypass | username | client_ip | url | category | url_filter | filter_policy | security-
options:
  drilldown {
    {
  entity [ ssl_bypass | username | client_ip | url | category | url_filter | filter_policy | security-category | host-n
values
  {
    [value ...]
  }
  } ...
  }
  email-addresses {
    [email address ...]
  }
  format [ csv-aggregated | csv-time-series | pdf ]
  include-total
  include-others
  limit [number of rows]
  measures {
    [measure name ...]
  }
  order-by {
    {
      measure [ measure name ]
      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate swg-blocked analytics reports. You can generate an application-security-network analytics report for the following entities:

- o ssl_bypass - Is HTTP/HTTPS inspection bypassed
- o username - User name
- o client-ip - Client IP
- o host-name - Host name
- o url - URL
- o category - URL category
- o security-category - Categories which their parent is 'Security' category
- o url-filter - URL filter
- o scheme - Scheme

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics swg-blocked report view-by client-ip
```

```
show analytics swg-blocked report view-by client-ip drilldown { {
entity scheme values { my_scheme } } }
```

```
send-mail analytics swg-blocked report view-by category measures {
blocked-count } limit 20 order-by { { measure blocked-count sort-type
desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

blocked-count
The total number of blocked requests for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics swg-blocked scheduled-report

NAME
scheduled-report - Configure scheduled reports for SWG (blocked).

MODULE
analytics swg-blocked

SYNTAX
Configure the scheduled-report component within the analytics swg-blocked module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]

```

options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]

```

DISPLAY

```

list scheduled-report
list scheduled-report [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [name] | [glob] | [regex] ] ... ]

```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the SWG (blocked) module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the SWG (blocked) scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics swg-blocked report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics swg-blocked report.

measures

The measures which are available for the selected entities.

`predefined-report-name`
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with `multi-leveled-report`.

`smtp-config`
Defines which SMTP configuration will be used to send the scheduled report. If set to `none`, the scheduled report will be disabled.

`device-group`
Defines the device-group which the report should generate the report for. If `'none'` is set to this field, then the report will be generate for the `'self'` device.

      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate swg analytics reports. You can generate an application-security-network analytics report for the following entities:

- o action - Transaction's action (Blocked / Allowed / Allowed with log)
- o ssl_bypass - Is HTTP/HTTPS inspection bypassed
- o username - User name
- o client-ip - Client IP
- o host-name - Host name
- o url - URL
- o category - URL category
- o url-filter - URL filter
- o scheme - Scheme

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```

show analytics swg report view-by client-ip

show analytics swg report view-by client-ip drilldown { { entity scheme
values { my_scheme } } }

send-mail analytics swg report view-by category measures { blocked-
count } limit 20 order-by { { measure blocked-count sort-type desc } }
format pdf email-addresses { some.one@someaddress.com }

For more syntactical examples, see the tmsh help manual for analytics
report.

```

OPTIONS

- device**
Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)
- device-list**
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)
- drilldown**
Specifies specific entities that are used as a filter.
- email-addresses**
Specifies the list of email addresses to which the report file is sent when using the send-mail command.
- file**
Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).
- format**
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.
- include-others**

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

request-count

The total number of requests for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2016-01-07 analytics swg report(1)

analytics swg scheduled-report

NAME

scheduled-report - Configure scheduled reports for SWG.

MODULE

analytics swg

SYNTAX

Configure the scheduled-report component within the analytics swg module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

delete scheduled-report [name]

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the SWG module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-  
report-name "Top blocked URLs" frequency every-6-hours email-addresses  
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-  
addresses add { person@domain.com } frequency every-6-hours smtp-config  
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour  
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the SWG scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics swg report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics swg report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate tcp analytics reports. You can generate a TCP analytics report for the following entities:

- o application - Application services
- o city-postcode - City and postcode of remote host
- o continent-code - Continent of remote host
- o country-region - Country and region of remote host
- o nexthop - MAC address of next routing hop
- o remote-address - IP address of remote host
- o request-side - Client-side or server-side connection
- o subnet - /24 subnet of remote host
- o user-key - Key user-defined by TCP::analytics iRule.
- o virtual - Virtual Server

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics tcp-analytics report view-by virtual
```

```
show analytics tcp-analytics report view-by virtual drilldown { {
entity remote-address values { 10.10.2.2 } } }
```

```
send-mail analytics tcp-analytics report view-by remote-address
measures { goodput-rcv } limit 20 order-by { { measure goodput-rcv
sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

avg-connection-goodput-received

The mean incoming goodput (in bits per second) of all TCP connections for the selected filter (entity).

avg-connection-goodput-sent
The mean outgoing goodput (in bits per second) of all TCP connections for the selected filter (entity).

connections-closed
The total number of connections ended for the selected filter (entity).

connections-length-mean
The mean connection length (in ms) for the selected filter (entity).

connections-opened
The total number connections started for the selected filter (entity).

delaystate-3whs
Time (in ms) spent by the connection in delay state three-way handshake (3WHS) for the selected filter (entity).

delaystate-app
Time (in ms) spent by the connection in delay state limited by lack of application data for the selected filter (entity).

delaystate-closing
Time (in ms) spent by the connection in delay state waiting for ack of FIN for the selected filter (entity).

delaystate-cwnd
Time (in ms) spent by the connection in delay state limited by the congestion window for the selected filter (entity).

delaystate-nagle
Time (in ms) spent by the connection in delay state where the app is limited, last packet held due to Nagle algorithm for the selected filter (entity).

delaystate-ratepace
Time (in ms) spent by the connection in delay state where the app is limited, transmission delayed by rate pacing for the selected filter (entity).

delaystate-retx
Time (in ms) spent by the connection in delay state retransmitting lost packets for the selected filter (entity).

delaystate-rwnd
Time (in ms) spent by the connection in delay state where the client receive window is limited for the selected filter (entity).

delaystate-sndbuf
Time (in ms) spent by the connection in delay state limited by send buffer configuration for the selected filter (entity).

delaystate-waitforack
Time (in ms) spent by the connection in delay state waiting for acknowledgement for the selected filter (entity).

goodput-received
The aggregate data rate (in bits per second) received over all connections for the selected filter (entity).

goodput-sent
The aggregate data rate (in bits per second) sent over all connections for the selected filter (entity).

max-connection-goodput-received
The maximum incoming goodput (in bits per second) on any TCP connection for the selected filter (entity).

max-connection-goodput-sent
The maximum outgoing goodput (in bits per second) on any TCP connection for the selected filter (entity).

min-connection-goodput-received
The minimum incoming goodput (in bits per second) on any TCP connection for the selected filter (entity).

min-connection-goodput-sent
The minimum outgoing goodput (in bits per second) on any TCP connection for the selected filter (entity).

packet-loss-rate
The fraction of sent packets that are lost for the selected filter (entity).

packets-lost
The total number of sent packets lost for the selected filter (entity).

packets-received
The total number of packets received for the selected filter (entity).

packets-sent
The total number of packets sent for the selected filter (entity).

rtt-avg
The mean round trip time (in ms) for the selected filter (entity).

rtt-max
The maximum round trip time in ms for the selected filter (entity).

rtt-min
The minimum round trip time (in ms) for the selected filter (entity).

rttvar-mean
The mean variance of the round trip time (in ms) for the selected filter (entity).

BIG-IP 2017-06-14 analytics tcp-analytics report(1)

analytics tcp-analytics scheduled-report

NAME

scheduled-report - Configure scheduled reports for TCP analytics.

MODULE

analytics tcp-analytics

SYNTAX

Configure the scheduled-report component within the analytics tcp-analytics module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the TCP analytics module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config
```

```
asm smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the TCP analytics scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics tcp-analytics report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics tcp-analytics report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate tcp analytics reports. You can generate a TCP analytics report for the following entities:

- o virtual - Virtual Server
- o tcp - TCP Profile

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics tcp report view-by virtual
```

```
show analytics tcp report view-by virtual drilldown { { entity virtual values { 172.12.34.56 } } }
```

```
send-mail analytics tcp report view-by tcp measures { max-active-conns } limit 20 order-by { { measure max-active-conns sort-type desc } } format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report. (Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

avg-active-conns

The average number of active connections for the selected filter (entity).

max-active-conns

The max number of active connections for the selected filter (entity).

total-accepts

The total number of accepted connections for the selected filter (entity).

total-accept_fails

The total number of denied accept connections for the selected filter (entity).

total-new-conns

The total number of new connections for the selected filter (entity).

total-failed-conns

The total number of failed connections for the selected filter (entity).

total-expired-conns

The total number of expired connections for the selected filter (entity).

total-abandoned-connections

The total number of abandoned connections for the selected filter (entity).

total-rst-packets

The total number of RST connections for the selected filter (entity).

total-malformed-segments

The total number of malformed connections for the selected filter (entity).

total-oo-segs

The total number of out of ordered segments for the selected filter (entity).

total-rx-cookie

The total number of received SYN cookies for the selected filter (entity).

total-rxbadcookies
The total number of received bad SYN cookies for the selected filter (entity).

total-hw-cookies
The total number of received HW SYN cookies for the selected filter (entity).

total-syncacheover
The total number of SYN cache overflow for the selected filter (entity).

total-txrextmits
The total number of retransmitted segments for the selected filter (entity).

total-sndpack
The total number of sent packets for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [name] | [glob] | [regex] ] ... ]
```

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the TCP module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.
modify scheduled-report myScheduledReport smtp-config none
Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.
create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }
Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.
list scheduled-report
Displays all of the TCP scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.
first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.
frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.
include-total
Enables or disables including a summary (Overall result) entity in results.
multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:
chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics tcp report.
limit
The number of view-by entities displayed in the scheduled report.
time-diff
The time range for the report.
view-by
The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics tcp report.
measures
The measures which are available for the selected entities.
predefined-report-name
Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.
smtp-config
Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.
device-group
Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

analytics traffic-classification scheduled-report

NAME

scheduled-report - Configure scheduled reports for traffic classification.

MODULE

analytics traffic-classification

SYNTAX

Configure the scheduled-report component within the analytics traffic-classification module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the traffic classification module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the traffic classification scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics traffic-classification report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics traffic-classification report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

include-total
include-others
limit [number of rows]
measures {
  [measure name ...]
}
order-by {
  {
    measure [ measure name ]
    sort-type [ asc / desc ]
  } ...
}
range [date range]

SAVE
save report view-by [ virtual | udp ]
options:
  drilldown {
    {
      entity [ virtual | udp ]
      values
      {
        [value ...]
      }
    } ...
  }
  file [ file name ]
  format [ csv-aggregated | csv-time-series | pdf ]
  include-total
  include-others
  limit [number of rows]
  measures {
    [measure name ...]
  }
  order-by {
    {
      measure [ measure name ]
      sort-type [ asc / desc ]
    } ...
  }
  range [date range]

SEND
send-mail report view-by [ virtual | udp ]
options:
  drilldown {
    {
      entity [ virtual | udp ]
      values
      {
        [value ...]
      }
    } ...
  }
  email-addresses {
    [email address ...]
  }
  format [ csv-aggregated | csv-time-series | pdf ]
  include-total
  include-others
  limit [number of rows]
  measures {
    [measure name ...]
  }
  order-by {
    {
      measure [ measure name ]
      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate udp analytics reports. You can generate a UDP analytics report for the following entities:

- o virtual - Virtual Server
- o udp - UDP Profile

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics udp report view-by virtual
```

```
show analytics udp report view-by virtual drilldown { { entity virtual
values { 172.12.34.56 } } }
```

```
send-mail analytics udp report view-by udp measures { max-active-conns
} limit 20 order-by { { measure max-active-conns sort-type desc } }
format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device
Specifies a BIG-IP device on which to generate a report.

(Enterprise Manager only)

device-list
Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown
Specifies specific entities that are used as a filter.

email-addresses
Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format
Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others
Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total
Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit
Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures
Specifies a list of measures that can be used with the chosen entity type. The options are:

avg-active-conns
The average number of active connections for the selected filter (entity).

max-active-conns
The max number of active connections for the selected filter (entity).

total-accepts
The total number of accepted connections for the selected filter (entity).

total-accept_fails
The total number of denied accept connections for the selected filter (entity).

total-new-conns
The total number of new connections for the selected filter (entity).

total-failed-conns
The total number of failed connections for the selected filter (entity).

total-expired-conns
The total number of expired connections for the selected filter (entity).

total-received-datagrams
The total number of received datagrams for the selected filter (entity).

total-malformed-datagrams
The total number of malformed datagrams for the selected filter (entity).

total-icmp-unreachable
The total number of ICMP unreachable for the selected filter (entity).

total-bad-sum-datagrams
The total number of bad checksum datagrams for the selected filter (entity).

total-no-sum-datagrams
The total number of 'no checksum' datagrams for the selected filter (entity).

total-transmitted-datagrams
The total number of transmitted datagrams for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics udp scheduled-report

NAME

scheduled-report - Configure scheduled reports for UDP.

MODULE

analytics udp

SYNTAX

Configure the scheduled-report component within the analytics udp module using the syntax shown in the following sections.

CREATE/MODIFY

```
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
    replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

DISPLAY

```
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete scheduled-report [name]
```

DESCRIPTION

Use the scheduled-report component to create, modify or delete scheduled reports for the UDP module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the UDP scheduled reports.

OPTIONS

email-addresses

A list of the email addresses of the recipients that receive the scheduled report.

first-time

First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics udp report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics udp report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

```

DESCRIPTION

Use this command to generate vcmp analytics reports. You can generate a vCMP analytics report for the following entities:

- o slot - Slot ID
- o guest - vCMP Guest name
- o interface - vCMP Interface
- o process-name - Process name

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics vcmp report view-by slot
```

```
show analytics vcmp report view-by slot drilldown { { entity slot
values { 5 } } }
```

```
send-mail analytics vcmp report view-by guest measures { network-bytes-
in } limit 20 order-by { { measure network-bytes-in sort-type desc } }
format pdf email-addresses { some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

network-bytes-in

The total number of external and internal bytes received for the selected filter (entity).

network-bytes-out

The total number of external and internal bytes sent for the selected filter (entity).

network-average-in-throughput

The average internal and external received throughput for the selected filter (entity).

network-average-out-throughput

The average internal and external throughput sent for the selected filter (entity).

average-guest-cpu-usage

The average number of CPU usage for the selected filter (entity) relative to host CPU.

diskio-bytes-read

The average number of bytes read from disk for the selected filter (entity).

diskio-bytes-written

The average number of bytes written to disk for the selected filter (entity).

diskio-requests-read

The average number of read requests from disk for the selected filter (entity).

diskio-requests-written

The average number of write requests from disk for the selected filter (entity).

average-process-cpu-usage

The average number of CPU usage for the selected filter (entity) normalized relatively to guest CPU.

traffic-client-new-connections

The total number of client-side new connections for the selected filter (entity).

traffic-client-avg-connections

The average number of client-side connections opened for a selected filter (entity).

traffic-client-packets-in

The total number of client-side received packets for a selected filter (entity).

traffic-client-packets-out

The total number of client-side sent packets for a selected filter (entity).

traffic-client-bytes-in
The total number of client-side received bytes for a selected filter (entity).

traffic-client-bytes-out
The total number of client-side sent bytes for a selected filter (entity).

traffic-server-new-connections
The total number of server-side new connections for the selected filter (entity).

traffic-server-avg-connections
The average number of server-side connections opened for a selected filter (entity).

traffic-server-packets-in
The total number of server-side received packets for a selected filter (entity).

traffic-server-packets-out
The total number of server-side sent packets for a selected filter (entity).

traffic-server-bytes-in
The total number of server-side received bytes for a selected filter (entity).

traffic-server-bytes-out
The total number of server-side sent bytes for a selected filter (entity).

total-assisted-connections
The total number of all hardware accelerated assisted connections for a selected filter (entity).

current-assisted-connections
The average number of all hardware accelerated assisted connections for a selected filter (entity).

hardware-syncookies-generated
The total number of SYN cookies generated for a selected filter (entity).

hardware-syncookies-detected
The total number of SYN cookies detected for a selected filter (entity).

hw-accel-client-packets-in
The total number of hardware accelerated client-side received packets for a selected filter (entity).

hw-accel-client-packets-out
The total number of hardware accelerated client-side received sent for a selected filter (entity).

hw-accel-client-bytes-in
The total number of hardware accelerated client-side received bytes for a selected filter (entity).

hw-accel-client-bytes-out
The total number of hardware accelerated client-side sent bytes for a selected filter (entity).

hw-accel-client-max-connections
The max number of hardware accelerated client-side connections for a selected filter (entity).

hw-accel-client-new-connections
The total number of hardware accelerated client-side new connections for a selected filter (entity).

hw-accel-client-current-connections
The average number of hardware accelerated client-side opened connections for a selected filter (entity).

hw-accel-server-packets-in
The total number of hardware accelerated server-side received packets for a selected filter (entity).

hw-accel-server-packets-out
The total number of hardware accelerated server-side received sent for a selected filter (entity).

hw-accel-server-bytes-in
The total number of hardware accelerated server-side received bytes for a selected filter (entity).

hw-accel-server-bytes-out
The total number of hardware accelerated server-side sent bytes for a selected filter (entity).

hw-accel-server-max-connections
The max number of hardware accelerated server-side connections for a selected filter (entity).

hw-accel-server-new-connections
The total number of hardware accelerated server-side new connections for a selected filter (entity).

hw-accel-server-current-connections

The average number of hardware accelerated server-side opened connections for a selected filter (entity).

tmm-total-ram
The average of total TMM memory for the selected filter (entity).

tmm-used-ram
The average of used TMM memory for the selected filter (entity).

tmm-free-ram
The average of free TMM memory for the selected filter (entity).

other-total-ram
The average of total other (daemons and kernel) memory for the selected filter (entity).

other-used-ram
The average of used other (daemons and kernel) memory for the selected filter (entity).

other-free-ram
The average of free other (daemons and kernel) memory for the selected filter (entity).

system-total-ram
The average of total system memory for the selected filter (entity).

system-used-ram
The average of used system memory for the selected filter (entity).

system-free-ram
The average of free system memory for the selected filter (entity).

swap-total-ram
The average of total swap memory for the selected filter (entity).

swap-used-ram
The average of used swap memory for the selected filter (entity).

swap-free-ram
The average of free swap memory for the selected filter (entity).

order-by
Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range
Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-lh).

smtp-config-override
Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

BIG-IP 2015-07-22 analytics vcmp report(1)

analytics vcmp scheduled-report

NAME
scheduled-report - Configure scheduled reports for vCMP.

MODULE
analytics vcmp

SYNTAX
Configure the scheduled-report component within the analytics vcmp

module using the syntax shown in the following sections.

```
CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
  email-addresses [none | add | delete | modify |
  replace-all-with] { email-address [string] }
  first-time [date]
  frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
  include-total [enabled | disabled]
  multi-leveled-report {
  chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
  limit [number of rows]
  time-diff [last-hour | last-day | last-week | last-month | last-year]
  view-by { entity name [string] }
  measures [none | add | delete | modify | replace-all-with] { measure name [string] }
  }
  predefined-report-name [name]
  smtp-config [name]
  device-group [name]
```

```
DISPLAY
list scheduled-report
list scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
show running-config scheduled-report
show running-config scheduled-report [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete scheduled-report [name]
```

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the vCMP module.

EXAMPLES

```
create scheduled-report myScheduledReport first-time now predefined-
report-name "Top blocked URLs" frequency every-6-hours email-addresses
add { person@domain.com } smtp-config asm_smtp_conf
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

```
modify scheduled-report myScheduledReport smtp-config none
```

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

```
create scheduled-report myCustomScheduledReport first-time now email-
addresses add { person@domain.com } frequency every-6-hours smtp-config
asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour
limit 5 chart-path add { policy violation } }
```

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

```
list scheduled-report
```

Displays all of the vCMP scheduled reports.

OPTIONS

email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency
The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total
Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report
Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path
A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics vcmp report.

limit
The number of view-by entities displayed in the scheduled report.

time-diff
The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics vcmp report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

      sort-type [ asc / desc ]
    } ...
  }
  range [date range]
  smtp-config-override [ smtp configuration object name ]

```

DESCRIPTION

Use this command to generate virtual analytics reports. You can generate a VIP analytics report for the following entities:

- o virtual - Virtual Server

Different measures are collected for each of these entities and can be a part of the report request.

EXAMPLES

```
show analytics virtual report view-by virtual
```

```
show analytics virtual report view-by virtual drilldown { { entity
virtual values { 172.12.34.67 } } }
```

```
send-mail analytics virtual report view-by virtual measures { total-
server-packets-in } limit 20 order-by { { measure total-server-packets-
in sort-type desc } } format pdf email-addresses {
some.one@someaddress.com }
```

For more syntactical examples, see the tmsh help manual for analytics report.

OPTIONS

device

Specifies a BIG-IP device on which to generate a report.
(Enterprise Manager only)

device-list

Specifies a custom list of BIG-IP devices on which to generate a report. (Enterprise Manager only)

drilldown

Specifies specific entities that are used as a filter.

email-addresses

Specifies the list of email addresses to which the report file is sent when using the send-mail command.

file Specifies the exported file path to be saved when using the save command. The file name should be simple (not a full path).

format

Specifies the exported file format to be saved or sent. This option must be specified when using the save or send-mail commands.

include-others

Specifies that the grand total for the measure is displayed for all entities, except for those shown in the result. It can be used along with include-total.

include-total

Specifies that a total summary row should be added to the analytics report. For average measures, the total value is also an average.

limit

Specifies the maximum number of rows/entities in the output result set/file. The default value is 10, not including the total row/entity. The maximum value is 1000.

measures

Specifies a list of measures that can be used with the chosen entity type. The options are:

total-client-packets-in

The total number of client-side received packets for the selected filter (entity).

total-client-packets-out

The total number of client-side sent packets for the selected filter (entity).

total-server-packets-in

The total number of server-side received packets for the selected filter (entity).

total-server-packets-out

The total number of server-side sent packets for the selected filter (entity).

total-client-bits-in

The total number of client-side received bits for the selected filter (entity).

total-client-bits-out

The total number of client-side sent bits for the selected filter (entity).

total-server-bits-in

The total number of server-side received bits for the selected filter (entity).

total-server-bits-out

The total number of server-side sent bits for the selected filter (entity).

total-client-conns

The total number of client-side connections for the selected filter (entity).

avg-client-concurrent-conns

The average number of client-side concurrent connections for the selected filter (entity).

max-client-concurrent-conns

The max value of client-side concurrent connections for the selected filter (entity).

total-server-conns

The total number of server-side connections for the selected filter (entity).

avg-server-concurrent-conns

The average number of server-side concurrent connections for the selected filter (entity).

max-server-concurrent-conns

The max value of server side concurrent connections for the selected filter (entity).

total-syncookies

The total number of syncookies for the selected filter (entity).

total-syncookies-accepts

The total number of accepted syncookies for the selected filter (entity).

total-syncookies-rejects

The total number of rejected syncookies for the selected filter (entity).

total-hw-syncookies

The total number of HW syncookies for the selected filter (entity).

total-hw-syncookies-accepts

The total number of accepted HW syncookies for the selected filter (entity).

order-by

Specifies the measures and sort type (ascending or descending) that will be used to sort the final report. The value for each measure is a previously chosen measure. The default value for sort type is desc (descending).

range

Specifies the time/date range of the analytics information that you want to display. The given results will reflect the time range chosen here. The default value is the last hour (now--now-1h).

smtp-config-override

Specifies the SMTP configuration to use when sending reports by email. This overrides the default SMTP settings.

analytics virtual scheduled-report

NAME
scheduled-report - Configure scheduled reports for virtual.

MODULE
analytics virtual

SYNTAX
Configure the scheduled-report component within the analytics virtual module using the syntax shown in the following sections.

CREATE/MODIFY
create scheduled-report [name]
modify scheduled-report [name]
options:
email-addresses [none | add | delete | modify |
replace-all-with] { email-address [string] }
first-time [date]
frequency [every-6-hours | every-12-hours | every-24-hours | every-week | every-month]
include-total [enabled | disabled]
multi-leveled-report {
chart-path [none | add | delete | modify | replace-all-with] { entity name [string] }
limit [number of rows]
time-diff [last-hour | last-day | last-week | last-month | last-year]
view-by { entity name [string] }
measures [none | add | delete | modify | replace-all-with] { measure name [string] }
}
predefined-report-name [name]
smtp-config [name]
device-group [name]

DISPLAY
list scheduled-report
list scheduled-report [[[name] | [glob] | [regex]] ...]
show running-config scheduled-report
show running-config scheduled-report [[[name] | [glob] | [regex]] ...]

DELETE
delete scheduled-report [name]

DESCRIPTION
Use the scheduled-report component to create, modify or delete scheduled reports for the virtual module.

EXAMPLES
create scheduled-report myScheduledReport first-time now predefined-report-name "Top blocked URLs" frequency every-6-hours email-addresses add { person@domain.com } smtp-config asm_smtp_conf

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top blocked URLs and is sent to person@domain.com using the smtp configuration defined in asm_smtp_conf.

modify scheduled-report myScheduledReport smtp-config none

Set smtp configuration of the scheduled report "myScheduledReport" to none, thus effectively disabling the scheduled report from begin generated and sent over eMail.

create scheduled-report myCustomScheduledReport first-time now email-addresses add { person@domain.com } frequency every-6-hours smtp-config asm_smtp_conf multi-leveled-report { view-by url time-diff last-hour limit 5 chart-path add { policy violation } }

Creates a scheduled report, starting from the next hour and executing every 6 hours. The report contains a PDF showing statistics for the top 5 violated URLs after drilling-down to the top policy followed by the top violation. The report is sent to person@domain.co using the smtp configuration defined in asm_smtp_conf.

list scheduled-report

Displays all of the virtual scheduled reports.

OPTIONS
email-addresses
A list of the email addresses of the recipients that receive the scheduled report.

first-time
First scheduled report time. Must be after current time and rounded up to the next round hour.

frequency

The scheduled report frequency. Example: every-6-hours means that the report will be generated and sent every 6 hours.

include-total

Enables or disables including a summary (Overall result) entity in results.

multi-leveled-report

Defines a custom multi-leveled report. Mutually exclusive with predefined-report-name. The multi-leveled-report definition contains the following parameters:

chart-path

A list of entities that define the scope in which the report will be displayed. For example: a chart path { violation url } means: Use the top violation list and generate a top URL list from it. These top URLs will be then used to display the view-by entity. For a list of valid entities see the help manual for analytics virtual report.

limit

The number of view-by entities displayed in the scheduled report.

time-diff

The time range for the report.

view-by

The main entity that the report is viewed by. For a list of valid entities see the help manual for analytics virtual report.

measures

The measures which are available for the selected entities.

predefined-report-name

Defines which predefined report (AKA predefined filter) will be used to generate the report. This keyword is mutually exclusive with multi-leveled-report.

smtp-config

Defines which SMTP configuration will be used to send the scheduled report. If set to none, the scheduled report will be disabled.

device-group

Defines the device-group which the report should generate the report for. If 'none' is set to this field, then the report will be generate for the 'self' device.

apm

apm aaa active-directory-trusted-domains

NAME

active-directory-trusted-domains - Manages authentication access policy (AAA) Active Directory(r) Trusted Domains.

MODULE

apm aaa

SYNTAX

Configure the active-directory-trusted-domains component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

```
create active-directory-trusted-domains [name]
modify active-directory-trusted-domains [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  root-domain [string]
  trusted-domains [add | delete | modify | replace-all-with] {
```

```

    {
    active-directory [name]
    }
}

edit active-directory-trusted-domains [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list active-directory-trusted-domains
list active-directory-trusted-domains [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete active-directory-trusted-domains [name]

```

DESCRIPTION

You can use the active-directory-trusted-domains component to manage AAA Active Directory Trusted Domains. You can use this object to configure cross-domain authentication across a forest. It also allows to configure Active Directory(r) agents to work in a Route Domains environment.

EXAMPLES

```

create active-directory-trusted-domains MyTRD { trusted-domains {
myDomain1 myDomain2 myDomain3 } root-domain /Common/myDomain2 }
Creates an object named MyTRD, sets domains myDomain1, myDomain2,
myDomain3 as trusted and the root-domain is set to myDomain2. To
use this example you need to have Active Directory servers
myDomain1, myDomain2 and myDomain3 pre-configured.

```

```

delete active-directory MyTRD
Deletes the AAA Active Directory Trusted Domains named MyTRD from
the system.

```

OPTIONS

```

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

```

```

description
Specifies a user-defined description for the Active Directory
Trusted Domains.

```

```

root-domain
Specifies an entry point to an Active Directory forest. An
initial authentication request will always to be sent to root
domain first. This setting is required.

```

```

trusted-domains
Specifies a list of AAA Active Directory server components. Trust
relationships should be defined for domains you add into this
list. This setting is required.

```

SEE ALSO

active-directory

options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

```

```

DELETE
delete active-directory [name]

```

DESCRIPTION

You can use the active-directory component to manage an AAA Active Directory server. The Active Directory is a network structure supported by Windows(r) 2000, or later, that provides support for tracking and locating any object on a network.

EXAMPLES

```

create active-directory MyADserver { domain-controller
  "server01.company.com domain "company.com " admin-name "administrator"
  admin-encrypted-password "!Myl23Password" }

```

Creates the AAA Active Directory server named MyADserver in the company.dom domain, sets the administrator logon name to administrator and the administrator password to !Myl23Password, and sets the Key Distribution Center to company.com.

```

delete active-directory MyActiveDirectoryServer

```

Deletes the AAA Active Directory server named MyActiveDirectoryServer from the system.

OPTIONS

admin-encrypted-password
Specifies the password associated with admin name. This option is required only when you are using an Active Directory Query agent with this Active Directory server object.

admin-name
Specifies the user name that has administrative permissions on an AAA Active Directory server. This option is required only when you are using an Active Directory Query agent with this Active Directory server object.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

cleanup-cache
Specifies whether this is a cache cleanup request. You can clean up the group, PSO or Kerberos cache. The default value is none.

description
Specifies a description for the component. The default is none.

domain
Specifies the Active Directory domain name. This setting is required.

[name]
Specifies the name of an AAA Active Directory server. This setting is required.

domain-controller
Specifies the fully qualified domain name (FQDN) of the domain controller for the domain specified in the domain option. The default is none.

domain-controllers
Adds, deletes, or replaces a set of domain controllers, by specifying an FQDN for each entry. You can configure the following

options for each domain controller:

ip An IP address for specified domain controller entry.

group-cache-ttl

Specifies group cache lifetime in days [0..1825]. The default value is 30. If you specify group cache lifetime 0, that means cache will be updated on every request.

pso-cache-ttl

Specifies password security objects (PSO) Cache lifetime in days [0..1825]. The default value is 30. If you specify PSO cache lifetime 0, that means cache will be updated on every request.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

pool Specifies the name of the pool with which the server is associated. The default is none.

partition

Displays the partition within which the component resides. The default is Common.

padata

Specifies a Kerberos preauthentication encryption type. If it is specified, the BIG-IP system includes Kerberos preauthentication data within the first AS-REQ. If you do not need to include preauthentication data, set this option to "none". Supported encryption types: none, des-cbc-crc, des-cbc-md5, aes128-cts-hmac-shal-96, aes256-cts-hmac-shal-96, rc4-hmac. The default is rc4-hmac.

timeout

Specifies a timeout interval (in seconds) after which an AAA Active Directory server closes a connection. The default is 15.

SEE ALSO

apm aaa crldp

NAME

crldp - Configure a Certificate Revocation List Distribution Point (CRDLP) server object for implementing a CRLDP authentication module.

MODULE

apm aaa

SYNTAX

Configure the crldp component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

create crldp [name]

modify crldp [name]

options:

address [ip addr]

allow-nullcrl [true | false]

app-service [[string] | none]

base-dn [[string>] | none]

cache-expire [[integer] | none]

connection-timeout [[integer] | none]

description [[string>] | none]

location-specific [true | false]

pool [name]

port [[integer] | none]

reverse-dn [true | false]

use-issuer [true | false]

use-pool [enabled | disabled]

verify-sig [true | false]

edit crldp | [glob] | [regex]] ...]

options:

all-properties

non-default-properties

DISPLAY

```
list crldp
list crldp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete crldp [name]
```

DESCRIPTION

Configure a CRLDP authentication server, and then assign the server to the CRLDP auth agent in your access policy.

EXAMPLES

```
create crldp aaa-ldap-2027 { address 172.27.32.60 allow-nullcrl false
base-dn DC=net,DC=aina,DC=test cache-expire 1000 connection-timeout 15
description none partition Common pool aaa-ldap-2027-pool port ldap
reverse-dn true use-issuer false use-pool disabled verify-sig true }
Creates a CRLDP server named aaa-ldap-2027.
```

```
delete crldp server my_crldp_server
Deletes the CRLDP server named my_crldp_server.
```

OPTIONS

address

Specifies the IP address of the server. This option is required.

allow-nullcrl

Specifies whether to consider a null CRL from the CRLDP server a successful authentication. The default is false.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

base-dn

Specifies the LDAP base directory name for certificates that specify the CRL distribution point in directory name (dirName) format. Used when the value of the X509v3 attribute crlDistributionPoints is of type dirName. In this case, the BIG-IP system attempts to match the value of the crlDistributionPoints attribute to the Base DN value. An example of a Base DN value is cn=xxxx,dc=f5,dc=com.

cache-expire

Specifies (in seconds) an update interval for CRL distribution points. The update interval for distribution points ensures that CRL status is checked at regular intervals, regardless of the CRL timeout value. This helps prevent CRL information from becoming outdated before the Access Policy Manager checks the status of a certificate.

connection-timeout

Specifies the number of seconds of inactivity the system allows before the connection times out. The default is 15.

description

Specifies a unique description for the server. The default is none.

partition

Displays the partition within which the component resides.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

pool Specifies the name of the pool with which the server is associated.

port Specifies the CRLDP service port. The default is 389.

reverse-dn

Specifies in which order the system is to attempt to match the Base DN value to the value of the X509v3 attribute crlDistributionPoints. Possible values are enabled and disabled. When set to enabled, the system matches the base DN from left to right, or from the beginning of the DN string, to accommodate dirName strings in certificates such as C=US,ST=WA,L=SEA,OU=F5,CN=xxx. The default value is false.

use-issuer

Specifies whether the CRL distribution point is extracted from the certificate of the client certificate issuer. The default is false.

use-pool

Enables or disables high availability between CRLDP servers. When enabled, Access Policy Manager sends CRLDP authentication requests for the associated CRLDP auth agent to the virtual server, and

standard pool behavior is used to implement high availability for CRDLP.

verify-sig

Specifies whether the signature on the received CRL is verified. The default is true.

apm aaa endpoint-management-system

NAME

endpoint-management-system - Manages an integration with a remote Mobile Device Management (MDM) server.

MODULE

apm aaa

SYNTAX

Configure the endpoint-management-system component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

create endpoint-management-system [name]

options:

type [airwatch | maas360 | ms-intune]
fqdn [string]
port [port]
serverssl-profile [name]
description [[string] | none]
username [string]
password [string]
mdm-token [[string] | none]
billing-id [[string] | none]
application-id [[string] | none]
access-key [[string] | none]
platform [[string] | none]
tenant-id [[string] | none]
client-id [[string] | none]
client-secret [[string] | none]
dns-resolver [[name] | none]
app-version [[string] | none]
sync-interval [[integer] | none]
location-specific [true | false]

modify endpoint-management-system [name]

options:

fqdn [string]
port [port]
serverssl-profile [name]
description [[string] | none]
username [string]
password [string]
mdm-token [[string] | none]
billing-id [[string] | none]
application-id [[string] | none]
access-key [[string] | none]
platform [[string] | none]
tenant-id [[string] | none]
client-id [[string] | none]
client-secret [[string] | none]
dns-resolver [[name] | none]
app-version [[string] | none]
sync-interval [[integer] | none]
location-specific [true | false]

edit endpoint-management-system [[name] | [glob] | [regex]] ...]

options:

all-properties
non-default-properties

DISPLAY

list endpoint-management-system

list endpoint-management-system [[name] | [glob] | [regex]] ...]

options:

all-properties
app-service
non-default-properties
one-line
partition

DELETE

delete endpoint-management-system [name]

DESCRIPTION

You can use the endpoint-management-system component to manage an integration with remote Mobile Device Management (MDM) server.

EXAMPLES

```
create endpoint-management-system MyEndpointManagementSystem { type
airwatch fqdn "server01.company.com" port 443 serverssl-profile
serverssl username "administrator" password "!My123Password" mdm-token
"token" }
```

Creates the endpoint management system named MyEndpointManagementSystem with MDM API URL server01.company.com:port, sets serverssl-profile to serverssl, sets the MDM administrator user name to administrator and the password to !My123Password, and sets the API token to token.

```
delete endpoint-management-system MyEndpointManagementSystem
Deletes the endpoint management system named
MyEndpointManagementSystem from the system.
```

OPTIONS

name Specifies the name for the endpoint management system. This setting is required.

type Specifies the type of endpoint management system: airwatch, maas360 or ms-intune. This setting is required.

fqdn Specifies the fully qualified domain name. This setting is required.

port Specifies the port number. Default is 443

serverssl-profile
Specifies the server SSL profile. This setting is required.

description
Specifies a description for the component. The default is none.

username
Specifies the user name of the MDM administrator. This setting is required.

password
Specifies the password the MDM administrator uses to log in. This setting is required.

mdm-token
Specifies the API token.

billing-id
Specifies the billing ID for the user's IBM Maas360 account. Valid only for maas360 type.

application-id
Specifies the application ID provided by IBM Maas360. Valid only for maas360 type.

access-key
Specifies the access key provided by IBM Maas360. Valid only for maas360 type.

platform
Specifies the platform version of the IBM Maas360 console. Valid only for maas360 type.

tenant-id
Specifies the Microsoft Intune Tenant Id. Valid only for ms-intune type.

client-id
Specifies the Client Id of the Web App created on Microsoft Azure for the Microsoft Intune Integration. Valid only for ms-intune type.

client-secret
Specifies the Client Secret of Web App created on Microsoft Azure for the Microsoft Intune Integration. Valid only for ms-intune type.

dns-resolver
Specifies the Dns Resolver. Valid only for ms-intune type.

app-version
Specifies the current version number of the application that corresponds to the account.

sync-interval
Specifies the length of time it takes for the synchronization to complete. The default is 240 minutes.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

apm aaa f5-mfa-configuration

NAME

f5-mfa-configuration - defines F5 multi-factor authentication configuration.

MODULE

apm aaa

SYNTAX

Configure the f5-mfa-configuration component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

```
create f5-mfa-configuration [name]
modify f5-mfa-configuration [name]
options:
  app-service [[string] | none]
  f5-service-connector [name]
  permitted-devices-types [add | delete | modify | replace-all-with] {
    [mobile | totp]
  }
  max-mobile-devices-per-user [[integer] | none]
  registration-sms-template [[string] | none]
  require-biometric [[true | false] | none]
```

```
edit f5-mfa-configuration [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list f5-mfa-configuration
list f5-mfa-configuration [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete f5-mfa-configuration [name]
```

DESCRIPTION

You can use the f5-mfa-configuration component to define F5 multi-factor authentication configuration.

EXAMPLES

```
create f5-mfa-configuration MyF5MFAConfiguration { f5-service-connector
MyF5ServiceConnector permitted-devices-types { mobile } max-mobile-
devices-per-user 2 registration-sms-template "Hello, Please follow the
link below to register your device for second factor authentication:
%{session.f5_mfa.device_registration.registration_url}" require-
biometric true }
```

Creates the f5 mfa configuration named MyF5MFAConfiguration with f5-service-connector MyF5ServiceConnector, adds mobile to permitted-devices-types, sets max-mobile-devices-per-user to 2, sets registration-sms-template to Hello, Please follow the link below to register your device for second factor authentication: %{session.f5_mfa.device_registration.registration_url} and sets require-biometric to true

```
delete f5-mfa-configuration MyF5MFAConfiguration
```

Deletes the f5 mfa configuration named MyF5MFAConfiguration from the system.

OPTIONS

[name]
Specifies the name for the f5 mfa configuration. This setting is required.

f5-service-connector
Specifies the f5-service-connector. This setting is required.

permitted-devices-types
Specifies permission of the use of mobile devices or hardware tokens (TOTP) or both for multi-factor authentication. This setting is required.

max-mobile-devices-per-user
Specifies the number of devices that one user can register for

multi-factor authentication.

registration-sms-template
Specifies the message to send to a user to register their mobile devices.

require-biometric
Set this item to true to require that the user present a physical characteristic, such as a fingerprint, on the mobile device for an additional authentication factor.

apm aaa f5-service-connector

NAME

f5-service-connector - Specifies properties for establishing a connection to an F5 multi-factor authentication service that is external to and separate from BIG-IP Access Policy Manager and the BIG-IP system.

MODULE

apm aaa

SYNTAX

Configure the f5-service-connector component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

```
create f5-service-connector [name]
modify f5-service-connector [name]
options:
  app-service [[string] | none]
  service-url [string]
  customer-id [string]
  customer-key [string]
  dns-resolver [name]
  serverssl-profile [name]
```

```
edit f5-service-connector [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list f5-service-connector
list f5-service-connector [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete f5-service-connector [name]
```

DESCRIPTION

You can use the f5-service-connector component to create F5 MFA Configuration component.

EXAMPLES

```
create f5-service-connector MyF5ServiceConnector { service-url
  "https://service01.company.com" customer-id "id01" customer-key "key01"
  dns-resolver new-dns-resolver serverssl-profile serverssl }
Creates the F5 service connector named MyF5ServiceConnector with
service URL https://service01.company.com, sets the customer id to
id01, sets the customer-key to key01, sets dns-resolver to new-
dns-resolver and sets serverssl-profile to serverssl
```

```
delete f5-service-connector MyF5ServiceConnector
Deletes the F5 service connector named MyF5ServiceConnector from
the system.
```

OPTIONS

[name]
Specifies the name for the F5 service connector. This setting is required.

app-service
Specifies the name of the application service to which the object

belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

service-url
Specifies the URL for connecting to the service. This setting is required.

customer-id
Specifies the customer id for the service. This setting is required.

customer-key
Specifies the customer key for the service. This setting is required.

dns-resolver
Specifies the DNS resolver for the connector to use. This setting is required.

serverssl-profile
Specifies the server SSL profile. This setting is required.

SEE ALSO

list http
list http [[[name] | [glob] | [regex]] ...]
options:
all-properties
app-service
non-default-properties
one-line
partition

DELETE
delete http [name]

DESCRIPTION

You can use the http component to create and manage AAA HTTP servers.

EXAMPLES

```
create http myHttpServer { start-uri "http://mycompany.com/" auth-type
basic-ntlm }
```

Creates an HTTP authentication server named "myHttpServer" with a starting URI of http://mycompany.com.

```
delete http myHttpServer
```

Deletes the myHttpServer AAA HTTP server.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auth-type
Specifies the type of authentication you want to use.

form-based
Specifies the authentication type to be form-based.

basic-ntlm
Specifies the authentication type to be basic-ntlm.

custom-post
Specifies the authentication type to be custom-post.

content-type
Specifies the encoding (xml-utf8, url-encoded-utf8, or none) for an HTTP custom post. If you specify 'none', you must use the headers option to add a custom header. In addition to specifying a custom header, you must apply your own encoding through an iRule.

custom-body
Specifies the body for a HTTP Custom Post.

description
Specifies a unique description for the server. The default is none.

follow-redirect
Specifies the number of pages away from the landing page the request should travel before failing.

form-action
Specifies the complete destination URL to process the form using HTTP form-based authentication. This is optional. If you do not specify a form action, then Access Policy Manager will use the URI from the request to perform HTTP form-based authentication.

form-fields
Specifies the hidden form parameters that are required by the authentication server logon form at your location. The default is none. Specify a parameter name, a space, and the parameter value, if any. Multiple parameters can be configured with each "name value" pair in one line. Use edit to add multiple parameters. Please note that create and modify do not allow using new line on the terminal.

form-method
Specifies the form method you want to use for the form-based HTTP authentication. The value is either Get or POST. The default is POST. However, if you specify GET, the Access Policy Manager will force the authentication using HTTP GET rather than perform authentication using form-based POST.

form-password
Specifies the parameter names used by the form you are sending the POST request to.

form-username
Specifies the parameter names used by the form you are sending the POST request to.

headers
Specifies the name and value of the header content to be inserted in an HTTP Post. The options are:

app-service
Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

hname
The name of the HTTP header.

hvalue
The value of the HTTP header.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either

true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies the name of the aaa http server. This option is required.

partition
Displays the partition within which the component resides. The default is Common.

start-uri
Specifies a URL resource, for example, `http://plum.tree.lab2.sp.companynet.com/`. This resource must respond with a challenge to a non-authenticated request.

success-match-type
Specifies the method your authentication server uses and determines the option definition used for this field. The field toggles according to your selection.

cookie
Specifies any string in cookie is required.

exact-cookie
Specifies key fields in cookie is required.

string
Specifies a specific string is required.

url Specifies a URL is required.

success-match-value
Specifies the URL, any string in cookie, exact cookie or specific string used for the specific success match type you see.

 non-default-properties
 one-line
 partition

DELETE
delete kerberos-keytab-file [name]

DESCRIPTION
You can use the kerberos-keytab-file component to create and manage a Kerberos Keytab file.

EXAMPLES

```
create kerberos-keytab-file my_keytab { source-path
file:/root/apmkeytab }
Creates a Kerberos Keytab file name my_keytab located at
root/apmkeytab.
```

```
delete kerberos-keytab-file my_keytab
Deletes the Kerberos Keytab file name my_keytab.
```

OPTIONS

```
app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.
```

```
source-path
Specifies the location of the Kerberos Keytab file.
```

```
partition
Displays the partition within which the component resides.
```

BIG-IP 2014-10-27 apm aaa kerberos-keytab-file(1)

apm aaa kerberos

NAME

kerberos - Configures a Kerberos server.

MODULE

apm aaa

SYNTAX

Configure the kerberos component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

```
create kerberos [name]
modify kerberos [name]
options
  auth-realm [[string] | none]
  app-service [[string] | none]
  keytab-file-obj [[string] | none]
  location-specific [true | false]
  service-name [[string] | none]
```

```
edit kerberos | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list kerberos
list kerberos [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete kerberos [name]
```

DESCRIPTION

You can use the kerberos component to create and manage AAA Kerberos servers. Use the Kerberos authentication server to configure authentication for the Access Policy Manager. A client retrieves credentials from the domain controller and passes those credentials to the Access Policy Manager. Then Access Policy Manager uses the value in the keytab-file-obj option of the Kerberos AAA server object to verify the credentials. Access Policy Manager system does not have to reside in the domain.

EXAMPLES

```
delete kerberos my_kerberos
Deletes the server named my_kerberos.
```

OPTIONS

auth-realm

Specifies a Kerberos auth realm name (administrative name), such as user@realm.com to establish the boundaries within which an authentication server has the authority to authenticate a user, host, or service. Kerberos clients manually map DNS domain names to Kerberos realm names. This option is required.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

keytab-file-obj

Specifies a keytab file that contains the keys (derived from the Kerberos password) that the server uses to authenticate the client. This option is required.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies the name of an AAA Kerberos server. This option is required.

partition

Displays the partition within which the component resides.

service-name

Specifies the Kerberos service name defined inside KDC in the format service name/hostname@kerberosrealm. This option is required, for example, HTTP.

one-line  
partition
```

```
DELETE
```

```
delete ldap [name]
```

```
DESCRIPTION
```

You can use the ldap component to create and manage an AAA LDAP server.

```
EXAMPLES
```

```
create ldap MyLDAPserver { address 172.30.6.144 admin-dn  
"cn=administrator,cn=users,dc=company,dc=companynet,dc=com" admin-  
encrypted-password "!MyPassword" }
```

Creates the AAA LDAP server named MyLDAPserver that is assigned the IP address 172.30.6.144 and the cn=administrator,cn=users,dc=company,dc=companynet,dc=com admin dn with a password of !MyPassword.

```
delete ldap MyLDAPServer
```

Deletes the AAA LDAP server named MyLDAPServer from the system.

```
OPTIONS
```

```
address
```

Specifies the IP address of an AAA LDAP server. This option is required.

```
admin-dn
```

Specifies the Container Distinguished Name (DN) to use for authentication. This option is required.

```
admin-encrypted-password
```

Specifies the password for admin name. This option is required.

```
app-service
```

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

```
base-dn
```

Specifies the base DN from which to search. This search DN is used to search groups across a whole directory.

```
group-cache-ttl
```

Specifies a lifetime for the group cache (days).

```
cleanup-cache
```

Specifies whether cache invalidation is required. The default is none. The options are:

```
none
```

```
group
```

```
description
```

Specifies a unique description for the server. The default is none.

```
is-ldaps
```

Specifies whether to use the LDAPS protocol during authentication. If true, you must also specify the option serverssl-profile.

```
location-specific
```

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

```
[name]
```

Specifies the name of the AAA server. This option is required.

```
partition
```

Displays the partition within which the component resides.

```
pool Specifies the name of the pool with which the server is
```

associated. The default is none.

```
port Specifies the port number of the AAA LDAP server. The default is
```

ldap. This option is required.

```
schema-attr
```

Specifies LDAP schema-specific attribute names.

user-object-class The value of the objectClass attribute for a user object. The default is "user".

user-memberof If the user object maintains a group membership, you should specify the membership attribute name here. The default is "memberOf".

group-object-class The value of the objectClass attribute for a

group object. The default is "group".
group-memberof If the group object maintains a group membership in other groups, you should specify a membership attribute name here. The default is "memberOf".
group-member If the group object maintains a list of users that belong to the group, you should specify the attribute here. The default is "member".
group-member-value If the "group-member" attribute is specified, you should specify the attribute that is used to add users into a group. The default is "dn".
serverssl-profile
Specifies the server side SSL profile. LDAPS is achieved by directing LDAP traffic over a virtual server that uses a server side SSL to communicate with the LDAP server.

The options are:

serverssl
serverssl-insecure-compatible
wom-default-serverssl
timeout
Specifies a timeout interval (in seconds) for the AAA server after which the server closes a connection. The default is 15.
use-pool
Enables or disables high availability between pool members. When enabled, the Access Policy Manager sends AAA requests for the associated policy item to the virtual server, and standard pool behavior is used to implement high availability for CRDLP.

partition

DELETE
delete oam [name]

DESCRIPTION

You can use the oam component to create and manage an AAA Oracle Access Manager server.

EXAMPLES

```
create oam oam10g { access-server-hostname www.localcorp.biz access-
server-name accessSrv1 access-server-port 6021 access-server-retries 0
accessgates { oam10gwebgate1 { encrypted-password [string] } } admin-id
firstname.lastname admin-password "[string]" global-access-protocol-
passphrase "[string]" transport-security-mode simple }
Creates the AAA OAM server named oam10g accessing the web gate
oam10gwebgate1 on the Access Server accessSrv1 at host name
www.localcorp.biz on port 6021. The server retries connections
zero times.
```

```
delete aaa oam MyOAMServer
Deletes the AAA Oracle Access Manager server named MyOAMServer
from the system.
```

OPTIONS

access-server-hostname
Specifies the IP address or FQDN of the Oracle Access Manager server. This option is required.

access-server-name
Specifies the name of the Oracle Access Manager server. This option is required.

access-server-port
Specifies the port of the Oracle Access Manager server. The default is 6021.

access-server-retries
Specify the number of times you want the access gate to attempt to connect to the Oracle Access Manager server when the action option is set to config-accessgate. The default is 0 (zero).

accessgates
Specifies the ID of the access gate or web gate on the OAM Server. The system supports the use of multiple access gates/web gates as long as they are from the same OAM server.

action
Specifies the Oracle Access Manager action type. Actions allow you to pass user profile information or to redirect the user's browser to another site. For more information on Actions, refer to the Access Administration Guide provided by Oracle. The options are:

config-accessgate
Specifies that you want the system to use the configureAccessGate tool.

noop Specifies "no operation performed." This is the default.

admin-id
Specifies the administrator ID required by the Oracle Access Manager server. This option is required.

admin-password
Specifies the administrator password required by the Oracle Access Manager server. The default is none.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description
Specifies a unique description for the Oracle Access Manager server. The default is none.

enable
Specifies whether you want to enable the server. The default is true.

global-access-protocol-passphrase
Specifies a global passphrase for all Oracle components. The default is none.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies the name of an AAA Oracle Access Manager server. This setting is required.

transport-security-mode
Specifies the transport security level for the communication between Oracle components and Access Policy Manager. The options are:

open Communication is not encrypted for protection. Use this mode when security is not an issue

simple
Communication is encrypted with Oracle Access Manager's internal CA. Simple mode encrypts communications using Transport Layer Security, RFC 2246 (TLS v1). This mode is less secure than Cert mode. Use this mode if you have some security concerns but do not want to manage your own CA.

cert Communication is encrypted with an external CA. Use cert mode if you want different certificates on OAM servers and webgates and you have a trusted 3rd party CA. Oracle Access Manager components use X.509 digital certificates in PEM format only.

NAME
oauth-provider - Manages an OAuth Provider.

MODULE
apm aaa

SYNTAX
Configure the oauth-provider component within the aaa module using the syntax shown in the following sections.

```
CREATE/MODIFY
create oauth-provider [name]
modify oauth-provider [name]
options:
  allow-self-signed-jwk-cert [bool]
  app-service [[string] | none]
  authentication-uri [[string] | none]
  auto-jwt-config-name [[string] | none]
  description [[string] | none]
  ignore-expired-cert [bool]
  last-discovery-time [date/time]
  manual-jwt-config-name [[string] | none]
  max-json-nesting-layers [integer]
  max-response-size [integer]
  openid-cfg-uri [[string] | none]
  save-json-payload [enabled | disabled]
  token-uri [[string] | none]
  token-validation-scope-uri [[string] | none]
  trusted-ca-bundle [[string] | none]
  type [custom | f5 | facebook | google | ping]
  use-auto-jwt-config [bool]
  userinfo-request-uri [[string] | none]

edit oauth-provider[ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list oauth-provider
list oauth-provider [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete oauth-provider [name]
```

DESCRIPTION
You can use the oauth-provider component to manage an OAuth Provider. The OAuth Provider specifies endpoint URIs to retrieve token, refresh token, validate token, get a list of scopes associated with token and redirect user to obtain authorization code. It specifies URIs to retrieve userinfo and to perform OpenID discovery to retrieve JSON web tokens and JSON web keys.

EXAMPLES
create oauth-provider f5Provider { authentication-uri
https://local.f5.com/f5-oauth2/v1/authorize auto-jwt-config-name
auto_jwt_f5Provider last-discovery-time 2017-06-09:07:48:57 openid-cfg-

```
uri
https://f5-oauth.local/f5-oauth2/v1/.well-known/openid-configuration
description "OAuth provider defines F5 AS" token-uri
https://local.f5.com/f5-oauth2/v1/token token-validation-scope-uri
https://local.f5.com/f5-oauth2/v1/validate trusted-ca-bundle
ca-bundle.crt type f5 }
Creates the OAuth Provider named f5Provider of type f5, defines
all endpoint URIs to the local Authorization Server.
```

```
delete oauth-provider f5Provider
Deletes the OAuth Provider named f5Provider from the system.
```

OPTIONS

```
allow-self-signed-jwk-cert
Specifies whether creating JWK config containing self-signed
certificate is allowed. The default value is yes.
```

```
app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.
```

```
authentication-uri
The endpoint URI that is used to redirect user for authentication
in order to get authorization code. This endpoint is used by
OAuth Client agent, when grant type is configured to Authorization
Code.
```

```
auto-jwt-config-name
Specifies the name of the auto-discovered JWT config.
```

```
description
Specifies a description for the component. The default is none.
```

```
ignore-expired-cert
Specifies whether the expired AS certificate enforcement is to be
ignored. The default value is false.
```

```
last-discovery-time
Specifies the last time JWT config and JWK config were auto-
discovered.
```

```
manual-jwt-config-name
Specifies the name of the manually created JWT config.
```

```
max-json-nesting-layers
Specifies the maximum nesting layers of JSON responses that will
be processed and stored. The default value is 8.
```

```
max-response-size
Specifies the size limit for all responses from all endpoints of
the provider. The default value is 128kb.
```

```
openid-cfg-uri
The endpoint URI that is used to pull JSON web tokens and JSON web
keys from Authorization server. This endpoint is used by OAuth
Client agent.
```

```
save-json-payload
Specifies whether the entire JSON text is to be saved in a session
variable. The default value is false.
```

```
partition
Displays the partition within which the component resides. The
default is Common.
```

```
token-uri
The endpoint URI that is used to retrieve an access_token. This
endpoint is used by OAuth Client agent.
```

```
token-validation-scope-uri
The endpoint URI that is used by OAuth Scope agent, in order to
retrieve a list of scopes associated with an access token. The
same URI is used to validate an access_token by OAuth Client
agent.
```

```
trusted-ca-bundle
Specifies the trusted CA bundle for AS certificate that is used
for autodiscovery of JSON web tokens and JSON web keys.
```

```
type The type of the provider.
```

```
use-auto-jwt-config
Specifies whether the OAuth Provider uses auto-discovered JWT
config specified in auto-jwt-config-name or manually created JWT
config specified in manual-jwt-config-name. The default value is
true.
```

```
userinfo-request-uri
The endpoint URI that is used to request userinfo information.
This endpoint is used by OAuth Scope agent.
```

```
custom The provider is using a custom Authorization Server.
azure-ad The provider is using an AzureAD Authorization Server.
azure-ad-b2c The provider is using an AzureAD-B2C Authorization
Server.
```

```
f5 The provider is using an F5 Authorization Server.
facebook The provider is Facebook Authorization Server.
google The provider is Google Authorization Server.
okta The provider is using an Okta Authorization Server.
ping The provider is Ping Identity Authorization Server.
Default value for provider type is f5.
```

BIG-IP 2018-01-18 apm aaa oauth-provider(1)

apm aaa oauth-request

NAME
oauth-request - Manages an OAuth Request.

MODULE
apm aaa

SYNTAX
Configure the oauth-request component within the aaa module using the syntax shown in the following sections.

```
CREATE/MODIFY
create oauth-request [name]
modify oauth-request [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  headers [add | delete | modify | replace-all-with] {
    [name] {
      value [value]
    }
  }
  method [get | post]
  parameters [add | delete | modify | replace-all-with] {
    [name] {
      type [parameter type]
      value [[string] | none]
    }
  }
  type [request type]
  uri [[string] | none]

edit oauth-request [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list oauth-request
list oauth-request [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete oauth-request [name]
```

DESCRIPTION
You can use the oauth-request component to manage an OAuth Request. The OAuth Request is an HTTP request that is used during communication between the BIG-IP system and an OAuth Authorization Server (AS). Different types of OAuth Requests can be configured for both OAuth Client and OAuth Scope agents.

EXAMPLES
create oauth-request F5AuthRedirectRequest { description "F5 Authentication Redirect request" method get parameters add { client_id { type client-id } redirect_uri { type redirect-uri } response_type { value "code" } } type auth-redirect-request }
Creates the OAuth Request named F5AuthRedirectRequest of type auth-redirect-request, sets HTTP method to get and specifies the list of GET parameters to be sent: client-id, redirect_uri, response_type.

delete oauth-request F5AuthRedirectRequest
Deletes the OAuth Request named F5AuthRedirectRequest from the system.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application

service can modify or delete the object.

description
Specifies a description for the component. The default is none.

headers
Adds, deletes, or replaces a set of headers, by specifying a header name and value for each entry.

value
The value of the header.

method
Specifies the HTTP method for the OAuth Request. The options are:

get Configures the system to make HTTP request using GET method.
post Configures the system to make HTTP request using POST method.

parameters
Adds, deletes, or replaces a set of parameters, by specifying a parameter name for each entry. You can configure the following options for each parameter:

type The type of the parameter. For a custom type of parameter, you must provide a value. For other parameter types, the value is taken from other configurations. The options for the type of a parameter are:

access-token The value for the parameter is `access_token`. Value assigned from session variable `session.oauth.client.access_token`
client-id The value for this parameter type is the Client Id that is configured in the OAuth Server object.
client-secret The value for this parameter type is the Client Secret that is configured in the OAuth Server object.
grant-type The value for this parameter type is the Grant Type that is configured in the OAuth Client agent.
redirect-uri The value for this parameter type is the Redirect URI that is configured in the OAuth Client agent.
resource-server-id The value for this parameter is the Resource Server Id that is configured in the OAuth Server object.
resource-server-secret The value for this parameter is the Resource Server Secret that is configured in the OAuth Server object.
scope The value for this parameter is the Scope that is configured in the OAuth Client agent.
custom Custom parameter value; you can specify any custom value for the parameter.

Default value for parameter type is `custom`.

value
The value of the parameter. A value is required for parameters of type `custom` only.

partition
Displays the partition within which the component resides. The default is `Common`.

type Type of the request. The options for the type of a request are:

auth-redirect-request The Authentication Redirect request. This type of request is used to redirect user to an Authorization Server, when OAuth Client agent is configured to use "Authorization Code" grant type.
token-request The Token request. This type of request is used to access an Authorization Server in order to obtain an `access_token` or exchange an authorization code for an `access_token`.
token-refresh-request The Refresh Token request. This type of request is used to refresh an expired access token.
token-revocation-request The Revocation request. This type of request is used to revoke an access token.
validation-scopes-request The Validation and Scopes request. This type of request is used in OAuth Client agent to validate an existing token. The same type of request is used to get a list of scopes associated with an existing token.
scope-data-request The Scope Data request. This type of request is used to obtain additional information from an Authorization Server.

Default value for request type is `scope-data-request`.

uri Request URI. This option is required for request of type `scope-data-request` only. All other types of requests use endpoint URIs configured at OAuth Provider component.

SEE ALSO COPYRIGHT

apm aaa oauth-server

NAME

oauth-server - Manages an OAuth Server.

MODULE

apm aaa

SYNTAX

Configure the oauth-server component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY

```
create oauth-server [name]
modify oauth-server [name]
options:
  app-service [[string] | none]
  client-id [string]
  client-secret [[string] | none]
  client-serverssl-profile-name [name]
  dns-resolver-name [name]
  mode [client | rs | client-rs]
  provider-name [name]
  resource-server-id [string]
  resource-server-secret [[string] | none]
  resource-serverssl-profile-name [name]
  rules [[string] | none]
  token-validation-interval [[integer] | none]
```

```
edit oauth-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list oauth-server
list oauth-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete oauth-server [name]
```

DESCRIPTION

You can use the oauth-server component to manage an OAuth Server. The OAuth Server specifies the configuration of an OAuth Authorization server for use by the OAuth Client or OAuth Scope agents.

EXAMPLES

```
create oauth-server f5Server { provider-name Google mode client client-
id myClientApplicationId client-secret
e939e21ead60c0406341c9be587a005056890213d480f456 client-serverssl-
profile-name serverssl dns-resolver-name myResolver}
Creates the OAuth Server named f5Server and defines all required
options. In this example, the BIG-IP system is supposed to only
acquire an access token from Google. The server mode is set to
client and resource server credentials are not needed.
```

```
delete oauth-server f5Server
Deletes the OAuth Server named f5Server from the system.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

client-id
Specifies the client application ID. The client application must be configured before configuring the OAuth Server on the BIG-IP system.

client-secret
Specifies the client application secret. The client application must be configured at the authorization server before configuring the OAuth Server on the BIG-IP system.

client-serverssl-profile-name
SSL profile to be used by the BIG-IP system when connecting to authorization server.

dns-resolver-name
DNS resolver object to be used by OAuth Server to resolve DNS names for endpoint URIs.

mode The mode of operation for the OAuth Server. The options for the mode of operation are:

client The OAuth Server can be used by OAuth Client agent only. In this mode, you do not need to specify Resource Server credentials.
rs The OAuth Server can be used by OAuth Scope agent only. In this

mode, you do not need to specify Client Application credentials. client-rs The OAuth Server can be used by either OAuth Client or OAuth Scope agent. Client Application credentials and Resource Server credentials are required.

partition

Displays the partition within which the component resides. The default is Common.

resource-server-id

Specifies the Resource Server ID. The Resource Server must be configured before configuring OAuth Server on the BIG-IP system.

resource-server-secret

Specifies the Resource Server Secret. The Resource Server must be configured before configuring OAuth Server on the BIG-IP system.

resource-serverssl-profile-name

SSL profile to be used by the BIG-IP system when connecting to resource server.

rules

The list of iRule events. You can apply an iRule event to modify a request or a response (except an authorization code request from the BIG-IP OAuth client to the OAuth authentication server).

token-validation-interval

Specifies the number of minutes that the token can remain valid. The token becomes invalid when this interval elapses or at the token expiry that the authentication server specifies, whichever is shorter. When the token expires, the subsession times out. (This setting applies only to a per-request policy).

DELETE

delete oosp [name]

DESCRIPTION

To implement the SSL OOSP authentication module, create an OOSP responder object and assign it to the OOSP auth agent in your access policy.

OPTIONS

allow-certs

Specifies whether the addition of certificates to an OOSP request is enabled. The default is true.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

ca-file

Specifies the name of the certificate file object containing trusted CA certificates used to verify the signature on the OOSP response. The default is none.

ca-path

Specifies the path to the trusted CA certificates used to verify the signature on the OOSP response. The default is none.

cert-id-digest

The cert ID digest is part of the OOSP protocol. The OOSP client (in this case, the BIG-IP system) calculates the cert ID using a hash of the Issuer and serial number for the certificate that it is trying to verify. The options are:

sha1 Newer algorithm that provides a higher security level with a 160 bit hash length. This is the default.

md5 Older algorithm with a 128 bit hash length.

chain

Specifies whether the system constructs a chain from certificates in the OOSP response. The default is true.

check-certs

Specifies whether the LTM system makes additional checks to see if the signer's certificate is authorized to provide the necessary status information. Use this option only for testing purposes. The default is true.

explicit-oosp

Specifies whether the BIG-IP system explicitly trusts that the OOSP response signer's certificate is authorized for OOSP response signing. If the signer's certificate does not contain the OOSP signing extension, setting this option to true causes a response to be untrusted. The default is true.

ignore-aia

Specifies whether to ignore the URL contained in the certificate's AIA fields, and to always use the URL specified by the responder instead. The default is false.

intern

Specifies whether to ignore certificates contained in an OOSP response when searching for the signer's certificate. When you set this option to true, you must also specify the signer's certificate using either the verify-other or va-file option. The default is true.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies a unique name for the component. This option is required.

nonce

Specifies whether a nonce will be sent in an OOSP request. When set to false, the request is sent without a nonce. The default is true.

partition

Displays the partition within which the OOSP responder object resides.

sign-digest
Specifies the algorithm (md5 or sha1) used to sign a request using a signing certificate and key. The default is sha1. If you use this option, you must also set the sign-key and sign-key-passphrase options.

sign-key
Specifies the key used to sign an OCSF request. If you use this option, you must also set the sign-digest and sign-key-passphrase options. The default is none.

sign-key-passphrase
Specifies the passphrase for the signing key. If you use this option, you must also set the sign-digest and sign-key options. The default is none.

sign-other
Specifies additional certificates to add to an OCSF request. The options are default.crt and ca-bundle.crt. The default is none.

signer
Specifies the certificate used to sign an OCSF request. If the certificate is specified but the key is not specified, then the private key is read from the same file as the certificate. If neither the certificate nor the key is specified, then the request is not signed. If the certificate is not specified and the key is specified, then the configuration is considered to be invalid. The default is none.

status-age
Specifies the amount of time (in seconds) to compare to the notBefore value of a status response. Use this option only when a status response does not include the notAfter field. The default is 0 (zero).

trust-other
Specifies whether the BIG-IP system trusts the certificates specified using the verify-other option. The default is false.

url Specifies the URL used to contact the OCSF service on the responder. This option is required. The default is none.

va-file
Specifies the name of the file containing explicitly-trusted responder certificates. Use this option when the responder is not covered by the certificates already loaded into the responder's CA store. The default is none.

validity-period
Specifies an acceptable error range in seconds. Use this option when the OCSF responder clock and a client clock are not synchronized, which could cause a certificate status check to fail. This value must be a positive number. This option is required. The default is 300.

verify
Specifies whether verification of an OCSF response signature or the nonce values is enabled. Use this option only for debugging purposes. The default is true.

verify-cert
Specifies whether the BIG-IP system verifies the certificate in the OCSF response. The default is true.

verify-other
Specifies the name of the file used to search for an OCSF response signing certificate when the certificate has been omitted from the response. The default is none.

verify-sig
Specifies whether the BIG-IP system checks the signature on the OCSF response. Use this option only for testing purposes. The default is true.

DESCRIPTION

You can use the radius component to create and manage an AAA RADIUS server.

EXAMPLES

```
create rad_auth { address 172.30.6.144 secret "test" use-pool  
"disabled" }
```

Creates the AAA RADIUS server named rad_auth that has an IP address of 172.30.6.144 and has a shared secret of test.

```
delete radius MyRadiusServer
```

Deletes the AAA RADIUS server named MyRadiusServer from the system.

OPTIONS

acct-port

Specifies the port number of the external AAA RADIUS accounting server. The default is radius-acct.

address

Specifies the IP address of the AAA RADIUS server. This option is required.

auth-port

Specifies the port number for the service. The default is radius. This option is required.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description

Specifies a unique description for the AAA RADIUS server. The default is none.

mode Specifies the configuration mode you want to use for RADIUS authentication. Note that you cannot modify the mode once you create the server. The options are:

acct Configures the system to perform only RADIUS accounting. Use this option to pass accounting information about your users to the external RADIUS accounting server.

auth Configures the system to perform only RADIUS authentication. Use this option to authenticate your users through a RADIUS server.

both Configures the system to perform both RADIUS authentication and RADIUS accounting simultaneously.

[name]

Specifies the name of an AAA RADIUS server. This option is required.

nas-ip-address

Specifies an IP address as RADIUS attribute 4 that you can

configure without changing the source IP address in the IP header of the RADIUS packets. Use this option in situations where you are using an NAS cluster to be recognized as a single RADIUS client.

nas-ipv6-address

Specifies an IPv6 address as RADIUS attribute 4 that you can configure without changing the source IP address in the IP header of the RADIUS packets. Use this option in situations where you are using an NAS cluster to be recognized as a single RADIUS client.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

partition

Displays the partition within which the component resides.

pool Specifies the name of the pool to which this server belongs. The default is none.

retries

Specifies the number of times the BIG-IP system tries to make a connection to the RADIUS AAA server after the first attempt fails. The default is 3.

secret

Specifies the shared secret password of the AAA RADIUS server. This option is required.

service-type

Specifies the type of service used for the RADIUS server. The default is default, which behaves as authenticate-only.

timeout

Specifies a timeout interval (in seconds) for the AAA RADIUS server after which the server closes a connection. The default is 5.

use-pool

Enables or disables the use of the pool specified using the pool option. The default is none.

    one-line
    partition

DELETE
delete saml-idp-automation [name]

```

DESCRIPTION

You can use saml-idp-automation to create and manage SAML IdP automation objects that are used to automate creation and management of 'IdP Connectors' from the remotely published metadata files.

EXAMPLES

```

create saml-idp-automation my_idp_automation1 { aaa-saml-server
my_saml_sp frequency 60 idp-matching-source "%{session.server.idpname}"
metadata-matching-tag Idpname idp-obj-name-tag displayname metadata-
urls add { https://f5.com/metadata.xml } connection-properties add {
cpl { dns-resolver-name myResolver serverssl-profile-name serverssl } }
}

```

Creates a SAML IdP automation object named my_idp_automation1 bound to a SAML SP service my_saml_sp with frequency set to 60 minutes, idp-matching-source as %{session.server.idpname}, metadata-matching-tag as Idpname, idp-obj-name-tag as displayname, one entry for metadata-url as https://f5.com/metadata.xml and connection-properties with dns-resolver-name as myResolver and serverssl-profile-name as serverssl.

```
list saml-idp-automation
```

Displays a list of SAML IdP automation objects.

```
delete saml-idp-automation my_idp_automation1
```

Deletes the my_idp_automation1 SAML IdP automation object.

OPTIONS

aaa-saml-server
Specifies the AAA SAML server to which the IdP connectors created by this automation are bound.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

connection-properties
Specifies the connection properties for fetching the metadata files. dns-resolver-name specifies the DNS resolver object to be used and serverssl-profile-name specifies the SSL profile to be used by the BIG-IP system when connecting to the server. Both DNS resolver and SSL profile should be configured if metadata files are located behind an SSL protected endpoint.

description
Specifies the description for the IdP automation object.

frequency
The frequency in minutes at which APM polls the IdP metadata files and updates the IdP connectors and bindings to the specified AAA SAML server. The default value is 60.

idp-matching-source
Specifies the selection criteria for IdP connectors. It must be in session variable format. It is used in configuration as a 'matching source' when binding created IdP connectors to configured AAA SAML server. At runtime, the value of this session variable is compared to metadata-matching-tag to determine which IdP connector is used to authenticate user.

metadata-matching-tag
This value is used in combination with idp-matching-source. It is used in configuration as a 'matching value' when binding created IdP connectors to configured AAA SAML server. At runtime, this value is compared against the value of session variable idp-matching-source to determine which IdP connector is used to authenticate user.

idp-obj-name-tag
Specifies the name of a tag within the metadata file that contains a value that APM includes in the names of the created IdP connectors.

metadata-urls
Specifies a list of one or more URLs containing the metadata files.

  non-default-properties
  one-line
  partition
```

DELETE

```
delete saml-idp-connector [name]
```

DESCRIPTION

You can use the saml-idp-connector to create and manage saml idp connectors.

EXAMPLES

```
create saml-idp-connector my_idp_connector { import-metadata
  /shared/tmp/meta_data_idp.xml }
Creates saml idp connector named my_idp_connector from metadata.
In this example "/shared/tmp/meta_data_idp.xml" is a file
containing saml identity provider metadata.
```

```
create saml-idp-connector my_idp_connector1 { entity-id
  "https://www.secureauth.com/dom1" identity-location subject sso-binding
  http-post sso-uri "https://www.secureauth.com/dom1/acs/" idp-
  certificate my_company.crt }
Creates a saml idp connector named my_idp_connector1 with
```

certificate "my_company.crt" with identity-location "subject".

`list saml-idp-connector`
Displays a list of saml idp connectors.

`delete saml-idp-connector my_idp_connector`
Deletes the my_idp_connector saml idp connector.

OPTIONS

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`artifact-resolution-service-addr`
Specifies the IP address that this BIG-IP as SP will use to connect to the IdP artifact resolution service. Value must be a valid IPv4 or IPv6 address.

`artifact-resolution-service-port`
Specifies the port that this BIG-IP as SP will use to connect to the IdP artifact resolution service.

`artifact-resolution-service-url`
Specifies the URI of the IdP artifact resolution service. The URI must include protocol, hostname, and full path.

`basic-auth-password`
Specifies the password for basic authentication. When configured, basic authentication is used for the artifact resolve request sent to the IdP.

`basic-auth-username`
Specifies username for basic authentication. When configured, basic authentication is used for the artifact resolve request sent to the IdP.

`description`
Specifies a unique description for the saml idp connector. The default is none.

`entity-id`
Specifies unique URI to represent the IdP pointed by idp connector.

`identity-location`
Specifies location of user identity inside SAML assertion. It can be either one of the attributes or the subject.

`identity-location-attribute`
If the location of user identity is set to attribute then attribute name should be specified as part of this attribute.

`idp-certificate`
This is IdP's certificate and is used by BIG-IP as SP to verify the signature of the assertion.

`import-metadata`
This attribute specifies the metadata file from an external IdP system used for creating idp connector object.

For example: `create saml-idp-connector my_idp_connector { import-metadata /shared/tmp/meta_data_idp.xml }`

`location-specific`
Objects of this class might have location specific attribute(s). Admin can indicate if object is location specific by setting it to true.

`metadata-cert`
This specifies the certificate to use to verify the signature of metadata imported from a file.

For example: `create saml-idp-connector my_idp_connector2 { import-metadata /shared/tmp/meta_data_signed_idp.xml metadata-cert default.crt }`

`name-qualifier`
Specifies the security or administrative domain of the external IdP. This value usually matches IdP Entity ID.

`serverssl-profile-name`
Specifies the SSL profile used when this BIG-IP as SP connects to the IdP artifact resolution service.

`sign-artifact-resolution-rq`
Specifies whether the IdP requires artifact resolve requests to be signed. Default value is true.

`single-logout-binding`
This attribute is reserved for future functionality.

`single-logout-response-uri`
A URI where this BIG-IP as SP will send single logout (SLO) responses.

`single-logout-uri`
A URI where this BIG-IP as SP will send single logout (SLO) requests.

`sso-binding`
This specifies the method the IdP uses to receive authentication

request from BIG-IP as SP. Default value is http-post

sso-uri

This specifies the URL of IdP's SSO service where BIG-IP as SP sends an authentication request to IdP.

want-authn-request-signed

This property specifies whether IdP requires signed authentication request. Set it to true if this BIG-IP as SP is required to send signed authentication request to IdP. Default value is false.

want-detached-signature

This property specifies signature type for messages sent by BIG-IP via HTTP Redirect binding. To use detached signatures set this property to true. Enveloped signatures are used by default.

delete saml [name]
```

DESCRIPTION

You can use the saml component to create and manage saml aaa servers.

EXAMPLES

```
create saml my_saml_server { entity-id "https://spvs1.mycompany.com/id"
  want-assertion-signed true want-assertion-encrypted false is-authn-
  request-signed true sp-certificate my_company.crt sp-signkey
  my_company.key}
Creates a SAML authentication server named my_saml_server with
certificate my_company.crt and key my_company.key and security
options requiring signed assertion and want to send signed
authentication request.
```

```
list saml
Displays a list of aaa saml servers.
```

```
delete saml my_saml_server
Deletes the my_saml_server aaa saml server.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

assertion-consumer-binding
Specifies method this BIG-IP as SP uses to receive assertions. Default value is http-post.

attribute-consuming-services
Add one or more attribute consuming services to this SP service. Each attribute consuming service is mapped to a unique attribute-consuming-service-index. The attribute consuming services added for this SP will be part of the metadata for the SP that can be exported and shared with IdP.

For example:

The following command associates two attribute consuming services to an SP and maps the first service to index 1 and the second service to index 2.

```
modify saml my_saml_server attribute-consuming-services add { my_atcsl { attribute-consuming-service-index 1 } my
```

auth-context-class-list
Specifies an ordered list of authentication context classes. The BIG-IP as SP uses this list to validate the authentication context (in the assertion from the IdP) against locally configured context methods (auth-context-methods) using the specified comparison method (auth-context-comparison-method).

This property is required if you use a comparison method (auth-context-comparison-method) other than the default ('exact'). You can specify any auth-context-class-list list that you have configured on the BIG-IP system. Or, you can specify the predefined auth-context-class-list list (authentication_contexts_list) that the BIG-IP system provides.

auth-context-comparison-method
Specifies the comparison method that the IdP must use to evaluate the requested context classes auth-context-methods, one of "exact", "minimum", "maximum", or "better". The default is exact. If non-default comparison method is configured, all context classes from auth-context-methods must be present in the configured priority list of classes auth-context-class-list.

auth-context-methods
Specifies a list of authentication context classes that this BIG-IP as SP will request from an IdP. As a response, the IdP must return an assertion containing one of the requested authentication contexts. Each value can be a session variable if the comparison method is set to 'exact', which is the default value.

default-attribute-consuming-service
Specifies one of the attribute consuming services associated with this SP as default service. The metadata for the SP will flag specified service as default.

description
Specifies a unique description for the server. The default is none.

entity-id
Specifies a unique identifier for BIG-IP as SP. Typically 'entity-id' is a URI that points to the BIG-IP virtual server that is going to act as SAML SP. In case 'entity-id' is not a valid URL, the sp-host attribute is required. Examples of valid configuration include "https://mycompany-sp", "sp:my:company", and

"sp.my.company.com".

force-authn

If enabled, this BIG-IP as SP requests the IdP to authenticate the principal directly rather than rely on a previous security context.

export-metadata

You can simplify SAML configuration using metadata files. When you use BIG-IP as an SP, you can export metadata for an SP to a file. Then you can use the file to configure SP metadata on an IdP system by importing the file or using the information in the file to configure the SP. You can choose to sign metadata while exporting it for better security.

For example:

1. Exporting metadata with signing. This requires metadata-cert and metadata-signkey files.

```
modify saml aaa_obj {export-metadata with-signing metadata-file /shared/sp_signed_metadata.xml metadata-cert defa
```

2. Exporting metadata with no signing.

```
modify saml aaa_obj {export-metadata no-signing metadata-file /shared/sp_metadata.xml}
```

idp-connectors

Add one or more IdP connectors to this SP service. BIG-IP SP redirect users to associated IdPs for authentication. If more IdP connectors associated with the SP, BIG-IP SP selects one of the IdP based on the specified selection criteria.

For example:

1. The following command associates one IdP connect to an SP

```
modify saml my_saml_server idp-connectors add { my_idp_connector1 }
```

2. Following associates multiple IdP connectors to SP with selection criteria based on landing URI. If the landing URI is /google, the user is sent to IdP as specified by my_idp_connector_google_app and if the landing URI is /salesforce, the user is sent to IdP as specified by my_idp_connector_for_salesforce.

```
modify saml my_saml_server idp-connectors add { my_idp_connector_google_app { idp-matching-source "%{session.serv
```

is-authn-request-signed

This property specifies whether the SP signs authentication requests while sending them to the IdP. Set it to true if this BIG-IP SP should sign authentication requests. The default value for this is false.

location-specific

Objects of this class might have location specific attributes. Admin can indicate if object is location specific by setting it to true.

metadata-cert

Specifies the certificate with public key of the key pair used in signing the metadata. See export-metadata for more information on metadata export functionality. This is the certificate to be included in signed metadata when we export metadata. This might or might not be SP certificate.

metadata-file

Specifies the file to which metadata is saved. See export-metadata for more information on metadata export functionality.

metadata-signkey

Specifies the key that is used to sign SP's metadata. See export-metadata for more information on metadata export functionality.

name-id-policy-allow-create

A Boolean value used to indicate whether external IdP is allowed, when processing requests from this BIG-IP as SP, to create a new identifier to represent the principal. Default value is false

name-id-policy-format

A URI reference representing the classification of string-based identifier information. For example, if a Service Provider (SP) initiates SSO by sending an AuthnRequest to the IDP with format "urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress", then the IdP response should contain subject identity in email format. This attribute can be a session variable.

name-id-policy-sp-name-qualifier

Optionally specifies that the assertion subject's identifier be returned in the namespace of an SP other than the requester, or in the namespace of a SAML affiliation group of SPs. This attribute can be a session variable.

relay-state

Specifies the value where the BIG-IP as SP redirects users after they are successfully authenticated and have been allowed by access policy. When BIG-IP receives the relay state from the IdP in addition to assertion, then it uses the value received from IdP to redirect the user to after authentication. Otherwise, BIG-IP uses the value from this configuration.

provider-name

Optionally specifies the human-readable name of this SAML SP for use by the identity provider.

sp-certificate
BIG-IP includes this certificate in the SAML SP metadata that you export. After the SAML SP metadata is imported on the IdP, the IdP can use this certificate to verify signed authentication request and to encrypt assertion.

sp-host
Hostname of this BIG-IP as SP. This attribute is required when "entity-id" is not a valid URL.

sp-scheme
Scheme used by this BIG-IP as SP. This attribute is only used when sp-host is not empty. Default value is https.

sp-signkey
This specifies the private key used to sign authentication requests if "is-authn-request-signed property" is set to true or to decrypt assertions when "want-assertion-encrypted" is set to true.

want-assertion-encrypted
This property specifies whether SP requires encrypted assertions. Set it to true if this BIG-IP SP requires encrypted assertions from the SAML IdP. The default value for this is false.

want-assertion-signed
This property specifies whether SP requires signed assertions. Set it to true if this BIG-IP SP requires signed assertions from the SAML IdP. The default value for this is true.

BIG-IP 2017-04-25 apm aaa saml(1)

apm aaa securid

NAME
securid - Manages an RSA SecurID authentication server.

MODULE
apm aaa

SYNTAX
Configure the securid component within the aaa module using the syntax shown in the following sections.

CREATE/MODIFY
create securid [name]
modify securid [name]
options:
 app-service [[string] | none]
 config-files [[string] | none]
 description [[string] | none]
 location-specific [true | false]
 source-ip [ip addr]

edit securid [[glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list securid
list securid [[name] | [glob] | [regex]] ...]
options:
 all-properties
 app-service
 non-default-properties
 one-line
 partition

DELETE
delete securid [name]

DESCRIPTION
You can use the securid component to create and manage an RSA SecurID authentication server.

EXAMPLES
create securid mySecuridServer { config-files add { sdconf.rec { local-path /shared/tmp/1 } } source-ip 172.31.54.138 }
Creates the mySecuridServer AAA RSA SecurID server.

list securid all
Displays a list of AAA RSA SecurID servers on the system.

delete securid mySecuridServer
Deletes the mySecuridServer AAA RSA SecurID server from the system.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

config-files
Specifies which files to use for SecurID authentication. Upload a copy of the sdconf.rec file from your RSA Authentication Manager server.

description
Specifies a description for the configuration file you are uploading.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

source-ip
Specifies the source IP address of the RSA SecurID agent. This option is required when authenticating to the RSA Authentication Manager server.

partition
Displays the partition within which the component resides.

apm aaa tacacsplus

NAME
tacacsplus - Configure a TACACS+ server for implementing remote TACACS+-based client authentication.

MODULE
apm aaa

SYNTAX
Configure the tacacsplus component within the apm aaa module using the syntax shown in the following sections.

CREATE/MODIFY
create tacacsplus
modify tacacsplus
options:
address [ip addr]
auth-service [arap | enable | fwproxy | login | nasi | none | ppp | pt | rcmd | x25]
auth-type [arap | ascii | chap | mschap | pap]
app-service [[string] | none]
description [[string] | none]
encrypt [enabled | disabled]
location-specific [true | false]
pool [[string] | none]
port [[string] | none]
priv-lvl [max | min | user]
protocol [atalk | deccp | ftp | http | ip | ipx | lat | lcp | osicp | pad | rlogin | telnet | tn3270 | unknown | v
secret [[string] | none]
service [none | arap | connection | firewall | ppp | shell | slip | system | tty-daemon]
use-pool [[string] | none]

edit tacacsplus [[glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list tacacsplus
list tacacsplus [[name] | [glob] | [regex]] ...]
options:
all-properties
app-service
non-default-properties
one-line
partition

DELETE
delete tacacsplus [name]

DESCRIPTION
You can use the tacacsplus component to create and manage a TACACS+ authentication server.

EXAMPLES
create tacacsplus mytacacs auth-service enable encrypt enabled
Creates a TACACS server named mytacacs with encryption enabled.

OPTIONS

address
Specifies the IP address of the TACACS+ server. This option is required.

auth-service
Specifies the name of the service that the user is requesting to be authenticated to use. This enables the TACACS+ server to behave differently for different types of authentication requests. This option is required.

auth-type
Specifies the type of authentication to be used for authenticating the user.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description
Specifies a unique description for the component. The default is none.

encrypt
Enables or disables encryption of TACACS+ packets. Recommended for normal use. The default is enabled.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies the name of an AAA TACACS+ server. This option is required.

partition
Displays the partition within which the component resides.

pool Specifies the name of the pool to which this server belongs. The default is none.

port Specifies the port number of the server. The default is 49.

priv-lvl
Specifies the privilege level at which the user is authenticating. The options are:

max
min This is the default.

user
protocol
Specifies the protocol associated with the value specified in the service option, which is a subset of the associated service being used for client authorization or system accounting. The default is unknown.

secret
Sets the secret key used to encrypt and decrypt packets sent or received from the server. This option is required.

service
use-pool
Enables or disables the use of the pool specified using the pool option. The default is none.

BIG-IP 2014-10-27 apm aaa tacacsplus(1)

apm access-info

NAME
access-info - Shows session related information such as session id, client ip, logon user and access profile name.

MODULE
apm access-info

SYNTAX
Shows the access-info component using the syntax shown in the following sections.

DISPLAY
show access-info
options:
all-properties
save-to-file

show access-info all
show access-info logon-user username
show access-info client-ip ip-address

EXAMPLES
show access-info
Displays the session id, client ip and logon user.

show access-info logon-user username
Displays the session id, and the corresponding client ip.

show access-info client-ip ip-address
Displays the session id and the corresponding logon user.

show access-info all-properties
The output of this command looks like this:

session	session_id
partition	partition Name
status	status of the session such as established and active
logon-user	username
client-ip	client ip address
virtual-server	virtual server name
profile-access-type	profile access type
access-profile	access profile name
start-time	start time of the session
expiration-time	expiration time of the session
rx-bytes	session traffic bytes in
tx-bytes	session traffic bytes out
rx-packets	session traffic packets in
tx-packets	session traffic packets out
ingress-raw	ingress raw bytes
ingress-compressed	ingress compressed bytes
egress-raw	egress raw bytes
egress-compressed	egress compressed bytes
slot	slot number (applicable only in the cluster environment)
tmm	tmm number for the session

Displays the session id, client ip, logon user and other information of session as shown above.

OPTIONS
session
Specifies the session id.

partition
Specifies the virtual server partition name.

status
Specifies the access status and valid values are established or pending.

logon-user
Specifies the logged in user name for the session.

client-ip
Specifies the client IP from which the session is established.

virtual-server
Specifies the name of the virtual server to which the session is established.

profile-access-type
Specifies access profile type; examples of valid values are: all, ltm-apm, ssl-vpn, sso, swg-explicit and swg-transparent.

access-profile
Specifies the access profile name.

start-time
Specifies the start time of the session.

expiration-time
Specifies the expiration time of the session.

rx-bytes)
Specifies the traffic bytes in for the session.

tx-bytes)
Specifies the traffic bytes out for the session.

rx-packets
Specifies the traffic packets in for the session.

tx-packets
Specifies the traffic packets out for the session.

ingress-raw
Specifies the ingress raw bytes for the session.

ingress-compressed
Specifies the ingress compressed bytes for the session.

egress-raw
Specifies the egress raw bytes for the session.

egress-compressed
Specifies the egress compressed bytes for the session.

slot Specifies the slot number for the session. Applicable only in the cluster environment.

tmm Specifies the tmm number that holds the session.

SEE ALSO
apm session

BIG-IP 2017-07-28 apm access-info(1)

apm acl

NAME
acl - Manages an access control list (ACL).

MODULE
apm

SYNTAX
Configure the acl component within the apm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create acl [name]
modify acl [name]
options:
  acl-order [integer]
  app-service [[string] | none]
  description [[string] | none]
  entries {
  {
options:
  action [allow | continue | discard | reject | unspec]
  dst-end-port [[service] | none]
  dst-start-port [[service] | none]
  dst-subnet [[ip addr] | [[ip addr] [mask]]
  host [[string] | none]
  log [config | none | packet | summary | verbose]
  paths [[string] | none]
  protocol [integer]
  scheme [any | http | https]
  src-end-port [[service] | none]
  src-start-port [[service] | none]
  src-subnet [[ip addr] | [[ip addr] [mask]]
  }
}
location-specific [true | false]
path-match-case [false | true]
type [dynamic | static]
```

DISPLAY

```
list acl
list acl [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    partition

show acl
show acl [ [ [name] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
```

```
DELETE
delete acl [name]
```

DESCRIPTION

You can use the `acl` component to configure a set of restrictions associated with a resource or favorite that defines access for users and groups.

EXAMPLES

```
create acl MyACL { acl-order 3 entries src-start-port ip default inet
  dst-end-port ip default inet action allow }
Creates the static access control list named MyACL that is the third ACL in the list of ACLs in the visual policy editor, and adds an access control entry that allows traffic using the default source IP address and the default destination IP address.
```

```
list acl all-properties
Displays a list of ACLs that includes the attributes of each ACL.
```

```
delete acl MyACL
Deletes the MyACL access control list.
```

OPTIONS

`acl-order`
Specifies the order of the access control entries in this access control list. This option is required.

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`description`
Describes the access control list.

`entries`
Configures an entry for an access control list.

`action`
Specifies the action that an access control list takes when this access control list entry is encountered. This option is required. You can specify one of the following actions:

`allow`
Allows traffic.

`continue`
Skips checking against the remaining access control list entries in this access control list, and continues evaluation at the next access control list.

`discard`
Drops packets silently.

`reject`
Drops a packet and sends TCP RST on TCP flows or proper ICMP messages on UDP flows. Silently drops a packet on other protocols.

`dst-end-port`
Specifies the destination IP address and network mask of the access control list entry. The default is 0.

`dst-start-port`
Specifies the source port or range of ports of the access control list entry.

`dst-subnet`
Specifies the destination subnet.

`host` Specifies the host name of the access control list entry.

`location-specific`
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The `location-specific` attribute is either true or false. When using policy sync, mark an object as `location-specific` to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

`log` Specifies the log level that is logged when actions of this type occur. Your options are:

`config`
Logs the configuration of a matched entry.

`none` Logs nothing. This is the default value.

packet
Logs a matched packet.

summary
Logs the name and entry number of a matched access control list and access control list entry.

verbose
Logs everything.

paths
Specifies an L7 access control list of matching URL paths.

protocol
Specifies the protocol number (TCP=6, UDP=17) of the access control list entry. The default is 0.

src-end-port
Specifies the source IP address and network mask of the access control list entry.

src-start-port
Specifies the source port or range of ports of the access control list entry.

src-subnet
Specifies the source subnet.

[name]
Specifies the name of the access control list. This setting is required.

partition
Displays the partition within which the object resides. The default is Common.

path-match-case
Indicates whether the path is case sensitive. The default is true.

type
Specifies the type of access control list. The default is static. The available types are static and dynamic.

apm apm-avr-config

NAME
apm-avr-config - Configures AVR overview/statistics settings for Secure Web Gateway Functionality

MODULE
apm

SYNTAX
Configure an apm-avr-config component within the apm module using the syntax shown in the following sections.

MODIFY
The AVR Configuration consists of the following information: boolean flag to turn off data collection by AVR; Boolean flag to turn off sampling by AVR; Both are on by default. No create or delete function is allowed.

```
modify apm-avr-config apm-avr-config {
    avr-collect-data [true | false]
    avr-sampling [true | false]
}
```

DISPLAY
list apm-avr-config
list apm-avr-config [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DESCRIPTION
Configures AVR Configuration for SWG Statistical Reporting

EXAMPLES
 modify apm-avr-config apm-avr-config { avr-collect-data false }

 Modify apm-avr-config by setting avr collect data to false.

OPTIONS
 avr-collect-data
 Specifies whether data should be collected or not for statistical reporting.

 avr-sampling
 Specifies whether sampling should be turned on or off.

COPYRIGHT
 No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-02-18 apm apm-avr-config(1)

apm client image

NAME
 image - Manages APM client software images.

MODULE
 apm client

SYNTAX
 Install, display information about, or delete a software image using the syntax in the following sections.

 INSTALL
 list image [name]

 DISPLAY
 list image
 list image [[[name [/slot_id]] | [glob] | [regex]] ...]
 options:
 checksum
 config-source
 file-size
 last-modified
 one-line

 DELETE
 delete image [[[name] ...] | [all]]

DESCRIPTION
 You can use the image component to install images, view information about available images, or delete unwanted images.

 INSTALLING A SOFTWARE IMAGE
 Before you begin installing an image, you must download the image file into the /shared/apm/images directory. You can find new software images at <http://downloads.f5.com>. We recommend downloading both the .iso file and the .md5 file. Download the file (or files) to your local machine, then transfer it to the /shared/apm/images directory on the BIG-IP. Use the Manager (GUI) interface to make this transfer, or quit tmsh to the Unix command line and use scp or a similar Unix command.

 If you downloaded the .md5 file, you can use the Unix md5sum command to check the MD5 hash of the .iso file, and you can compare it to the contents of the .md5 file. They should match. If they do not, retry the download and/or transfer of the .iso file.

 Use the install command with this component to install the .iso file.

 Note: You use the slot_id option only for chassis systems and only when displaying the values for the options of a specific image. You do not use the slot_id option when installing or deleting an image, because these commands operate on all blades or the entire system.

EXAMPLES
 list image apmclients-13.0.0-1914.0.iso

 Displays information about the specified image,
 apmclients-13.0.0-1914.0.iso.

 list image */1

 Displays information about all of the images located on the first slot.

 install image apmclients-13.0.0-1914.0.iso

 Attempts to install the specified image, apmclients-13.0.0-1914.0.iso.

delete image apmclients-13.0.0-1914.0.iso

Removes the specified image, apmclients-13.0.0-1914.0.iso from /shared/apm/images directory.

OPTIONS

checksum

Displays the checksum of the image. You can use this option to verify the integrity of the image.

config-source

Displays the source of the image: "user" or "base".

file-size

Displays the size of the image file in megabytes.

last-modified

Displays the date the file was last modified.

name Specifies the name of the image that you want to install or delete.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

delete, glob, install, list, regex, tmsh, show

DISPLAY

list captcha

list captcha [[[name] | [glob] | [regex]] ...]

options:

all-properties

app-service

non-default-properties

one-line

partition

DELETE
delete captcha [name]

DESCRIPTION
You can use the captcha component to create and manage CAPTCHA configuration.

EXAMPLES
create captcha mycaptcha {secret 123456789abcdef site-key fedcba987654321 }
Creates a CAPTCHA version 2 configuration named mycaptcha that uses site secret 123456789abcdef and site key fedcba987654321.

delete captcha mycaptcha
Deletes the CAPTCHA version 2 configuration named mycaptcha from the system.

OPTIONS
captcha-data-size
Specifies the size of the reCAPTCHA widget. The default is data-size-normal.

captcha-data-theme
Specifies the color theme of the reCAPTCHA widget. The default is data-theme-light.

captcha-data-type
Specifies the type of CAPTCHA to server. The default is data-type-image.

captcha-theme
This option is specific to reCAPTCHA v1 and is deprecated in version 13.0.0.

challenge-url
Specifies the URL of the service that provides the CAPTCHA challenge. The default is www.google.com/recaptcha/api.js.

description
Specifies a unique description for the CAPTCHA configuration.

exposition-threshold
Specifies the number of logon attempts to allow before issuing a CAPTCHA challenge. The default is 0.

noscript-url
Specifies the URL to use for obtaining the challenge if JavaScript is disabled. The default is www.google.com/recaptcha/api/fallback.

private-key
This option is specific to reCAPTCHA v1 and is deprecated in version 13.0.0.

proceed-on-verification-error
Specifies whether to allow user access when CAPTCHA verification cannot be completed for some reason. The default is true.

public-key
This option is specific to reCAPTCHA v1 and is deprecated in version 13.0.0.

secret
Specifies the secret provided by the CAPTCHA service provider. This option is required.

site-key
Specifies the site key provided by the CAPTCHA service provider. This option is required.

track-by-ip
Specifies whether to track logon failures using IP address. The default is true.

track-by-username
Specifies whether to track logon failures using username. The default is true.

verification-url
Specifies the URL of the service that verifies the response to the CAPTCHA challenge. The default is www.google.com/recaptcha/api/siteverify.

SEE ALSO

apm epsec epsec-package

NAME
epsec-package - Manages an EPSEC package.

MODULE
apm epsec

SYNTAX
Configure the epsec-package component within the apm epsec module using the syntax shown in the following sections.

CREATE
create epsec-package
options:
 local-path [string]
 server [[string] | none]

DISPLAY
list epsec-package
options:
 all-properties
 non-default-properties
 recursive

list epsec-package [name]

INSTALL
install epsec-package [name]
options:
 device-group [string]

DELETE
delete epsec-package [name]

DESCRIPTION
You can use the epsec-package component to create, install and manage an EPSEC package.

EXAMPLES
create epsec-package my_epsec_package local-path /tmp/my_epsec_package
Creates an EPSEC package named my_epsec_package under the /Common/EPSEC/Upload folder.

list epsec-package
Displays a list of EPSEC packages under the specific folder. To list all EPSEC packages use the recursive option.

install epsec-package my_epsec_package
Installs the EPSEC package named my_epsec_package on this device. You cannot install a package from the /Common folder as it is a pre-installed package.

install epsec-package my_epsec_package device-group /Common/my_epsec_dg
Installs the EPSEC package named my_epsec_package on the devices in the device group /Common/my_epsec_dg. You cannot install a package from the /Common folder as it is a pre-installed package.

delete epsec-package my_epsec_package
Deletes the EPSEC package named my_epsec_package.

OPTIONS
[name]
Specifies the name of the component. This option is required.

local-path
Specifies the local path of the package to be uploaded. This option is valid only with CREATE command and is a required option.

device-group
Specifies the device group on which the package will be installed. This option is valid only with INSTALL command

SEE ALSO

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015-07-22 apm epsec epsec-package(1)

NAME
software-status - Displays the status of the EPSEC software installation.

MODULE
apm epsec

SYNTAX
Display information about the software-status component within the apm epsec module using the following syntax.

DISPLAY
show software-status

DESCRIPTION
You can use the software-status component to display the status of the EPSEC software installation, including the version of the EPSEC package being installed and the OESIS software version.

EXAMPLES
show software-status

Displays the status of the EPSEC software installation in a table.

OPTIONS

SEE ALSO
epsec-package

BIG-IP 2012-08-17 apm epsec software-status(1)

apm license

NAME
license - Shows the session information related to apm license.

MODULE
apm

SYNTAX
Displays the apm license information.

DISPLAY
show apm license

DESCRIPTION
APM module license is based on the session count depending on the platform. This module shows the total session information for access, ccu (connectivity), swg, swg limited and the currently used sessions for access, ccu, swg, swg limited. In addition, the statistics include the threshold percent for all the sessions.

EXAMPLES
show apm license

Displays the apm license usage information.

total access sessions
Total access sessions for BIG-IP. This number is based on the license and platform type.

current active sessions
The number of access sessions that are currently in use.

current established sessions
Total number of currently established sessions.

access sessions threshold percent
Access sessions threshold warning percent set by the user. The default is 75%.

total connectivity sessions
Total connectivity sessions (ccu) for BIG-IP. This number is based on the license and platform type.

current connectivity sessions
The number of connectivity sessions (ccu) that are currently in use.

connectivity sessions threshold percent
Connectivity sessions threshold warning percent set by the user. The default is 75%.

total swg sessions
Total swg sessions for BIG-IP. This number is based on the subscription-based swg license.

current swg sessions
The number of swg sessions that are currently in use.

swg sessions threshold percent
SWG sessions threshold warning percent set by the user. The default is 75%.

total swg limited sessions
Total swg limited sessions for BIG-IP. This number is based on the license and platform type.

current swg limited sessions
The number of swg limited sessions that are currently in use.

swg limited sessions threshold percent
SWG limited sessions threshold warning percent set by the user. The default is 75%.

COPYRIGHT

BIG-IP 2015-06-05 apm license(1)

apm log-setting

NAME

log-setting - Configures log configurations for various features in APM, such as URL Filter/Classification (URL Filter).

MODULE

apm

SYNTAX

Configure the log-setting component within the module using the syntax shown in the following sections.

CREATE/MODIFY

Consider log-setting as a container for log configurations belonging to different features. At this time URL Filter is the only feature with a log setting.

```
create log-setting [name]
modify log-setting [name]
options:
  description
  url-filters [add | delete | modify | replace-all-with] {
    [item name] {
  filter { log-allowed-url [true|false] log-blocked-url [true|false] }
  publisher [string]
    }
  }
  access [add | delete | modify | replace-all-with] {
    [item name] {
  log-level {
    access-control [emerg|alert|crit|err|warn|notice|info|debug]
    access-per-request [emerg|alert|crit|err|warn|notice|info|debug]
    apm-acl [emerg|alert|crit|err|warn|notice|info|debug]
    eca [emerg|alert|crit|err|warn|notice|info|debug]
    paa [emerg|alert|crit|err|warn|notice|info|debug]
    sso [emerg|alert|crit|err|warn|notice|info|debug]
    swg [emerg|alert|crit|err|warn|notice|info|debug]
  }
  publisher [string]
    }
  }
```

DISPLAY

```
list log-setting
list log-setting [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DESCRIPTION

Configures a container for log configurations.

NOTE: Each container can enclose log configurations for many different features. However, each feature can only have one log configuration in a container.

NOTE: For the log configuration to take effect, the log-setting must be associated with an access profile (See man page for apm access profile).

NOTE: A log-setting container cannot be deleted if it is associated with an access profile.

EXAMPLES

```
create log-setting my-log-cfg
```

Creates a container without any log configuration.

```
create log-setting my-log-cfg url-filters add { my-urlf { filter { log-allowed-url true } publisher my-publisher } }
```

Creates a container with a log configuration for the URL Filter feature. At this version, URL Filter is the only feature with a log configuration.

```
modify log-setting my-log-cfg url-filters modify { my-urlf { publisher my-other-publisher } }
```

Modify the publisher of a log configuration.

```
modify log-setting my-log-cfg url-filters modify { my-urlf { filter { log-allowed-url false } } }
```

Modify the setting of a log filter

```
create log-setting my-log-cfg access add { my-access { publisher my-publisher } }
```

Creates a container with a log configuration for APM logging.

```
modify log-setting my-log-cfg access modify { my-access { log-level { access-control debug } } }
```

Modify the log level for module access-control.

OPTIONS

description

Specifies a unique description for the log-setting container.

url-filters

This is the list to store log configurations for the URL Filter feature.

item name

Specifies the name of the log configuration to be added to the list url-filters. Currently, the list supports only one item.

filter

Specifies the value for different log filters. In particular, URL Filter log configuration has two filters:

```
log-allowed-url [true|false]
log-blocked-url [true|false]
```

publisher

Specifies the publisher of the log configuration. See sys log-config publisher.

access

This is the list to store log configurations for APM logging.

log-level

This is the list of log level settings for different modules in the APM family.

apm ntlm machine-account

NAME

machine-account - Configures an APM NTLM machine account object.

MODULE

apm ntlm

SYNTAX

Configure the ntlm machine account using the syntax shown in the following sections.

CREATE/MODIFY

```
create machine-account [name]
```

options:

```
action [noop]
administrator-name [[string] | none]
administrator-password [[string] | none]
app-service [[string] | none]
domain-controller-fqdn [fqdn]
domain-fqdn [fqdn]
machine-account-name [[string] | none]
```

```
modify machine-account [name]
```

options:

```
action [change-password | noop]
app-service [[string] | none]
domain-controller-fqdn [fqdn]
```

```
edit machine-account [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list machine-account
```

```
list machine-account [ [name] | [glob] | [regex] ] ... ]
```

DELETE

```
delete machine-account [name]
```

DESCRIPTION

You can use the machine-account component to configure a NTLM machine account.

EXAMPLES

```
create machine-account myaccount { machine-account-name
"my_account_name" domain-fqdn "company.com" domain-controller-fqdn
"server01.company.com" administrator-name "administrator"
administrator-password "!My123Password" }
Creates a NTLM machine account named myaccount in the company.com
domain, with domain controller server01.company.com, administrator
name administrator and administrator password !My123Password.
```

```
list machine-account
Displays a list of all NTLM machine accounts created on the
system.
```

```
delete machine-account myaccount
Deletes the NTLM machine account named myaccount the system.
```

OPTIONS

machine-account-name
Specifies the name of the machine account.

domain-fqdn
Specifies the Fully Qualified Domain Name. This setting is required.

domain-controller
Specifies the Fully Qualified Domain Name (FQDN) of the domain controller for the domain specified in the domain-fqdn option. The default is none.

administrator-name
Specifies the name of a user that has administrative permissions on an Active Directory server. This setting is required only when a new machine account is being created.

administrator-password
Specifies the password associated with administrator-name. This setting is required only when a new machine account is being created.

action
Specifies the action type. To change the machine account password, type this action: change-password else noop

change-password
Specifies that you want to change the machine account password.

noop Specifies "no operation performed". This is the default.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

options:
 all-properties
 non-default-properties

DISPLAY
list ntlm-auth
list ntlm-auth [[[name] | [glob] | [regex]] ...]

DELETE
delete ntlm-auth [name]

DESCRIPTION
You can use the ntlm-auth component to configure an NTLM authentication object.

EXAMPLES
create ntlm-auth myaccount { dc-fqdn-list add { server01.company.com }
 machine-account-name "my_account" }
Creates a NTLM authentication object named myaccount with machine account my_account, and the list of domain controllers specified by dc-fqdn-list

list ntlm-auth
Displays a list of all NTLM authentication objects created on the system.

delete ntlm-auth myaccount
Deletes the NTLM authentication object named myaccount from the system.

OPTIONS
dc-fqdn-list
Specifies a list of Fully Qualified Domain Names (FQDNs) for the domain controllers to use for NTLM authentication.

machine-account-name
Specifies the NTLM machine account object name to use for this NTLM authentication

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

SEE ALSO

apm oauth db-instance

NAME
db-instance - Manages various OAuth database instances for this partition.

MODULE
apm oauth

SYNTAX
Configure the db-instance component within the oauth module using the following syntax.

CREATE/MODIFY
create db-instance [name]
modify db-instance [name]
options:
app-service [[string] | none]
description [[string] | none]
purge-frequency [daily | hourly | monthly | never | weekly]
purge-now
purge-time [string]
edit db-instance [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line

DISPLAY
list db-instance
list db-instance [[[name] | [glob] | [regex]] ...]
show running-config db-instance
show running-config db-instance [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line

DELETE
delete db-instance [name]

DESCRIPTION
OAuth authorization server supports persistence for OAuth tokens and related data using on-disk databases. This data can be grouped into separate logical entities using database instances. The db-instance component can be used to manage such database instances within a partition.

Because disk size is a limited resource, expired/obsolete tokens need to be purged in order to make space for newly issued tokens. The db-instance component provides options to purge either periodically, using combination of purge-frequency and purge-time or on-demand, using purge-now. The default setting for purge-frequency is daily and for purge-time is 02:00 hours for a newly created database instance. When executed, database instance purging removes revoked, expired access tokens, refresh tokens, auth code and associated entries from the particular instance. Expired access tokens will not be removed if the reuse-access-token setting is enabled in the corresponding OAuth profile.

EXAMPLES
create db-instance myDbInstance {
description "Sales Team"
purge-frequency weekly
purge-time "00:00"
}

Creates a database instance named myDbInstance that, when associated with an OAuth profile, stores tokens related to the OAuth profile in a separate database. This database instance is for the Sales team within the company. Stored data is purged weekly at 12AM.

list db-instance

Displays a list of all DB instances on the Authorization server.

delete db-instance myDbInstance

Deletes the database instance myDbInstance.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application

service can modify or delete the object.

db-name

Specifies the actual name of the DB on BIG-IP. The value is unique for each DB instance and can be used to debug oauth DB interactions with BIG-IP storage.

description

Specifies a user-defined description for the database instance. The default value is none.

[name]

Specifies the name of the OAuth database instance. This setting is required.

partition

Displays the partition within which the component resides.

purge-frequency

Specifies the frequency at which data should be purged. The default value is daily. Other possible values are hourly, monthly, never and weekly.

purge-now

Indicates a request to purge the data right now.

purge-time

Specifies the time at which data should be purged. The default value is 02:00. HH:MM format must be used to specify time value.

apm oauth jwk-config

NAME

jwk-config - Manages JSON Web Keys to be used with Authorization Server/Client/Resource Server

MODULE

apm oauth

SYNTAX

Configure the jwk-config component within the oauth module using the following syntax.

CREATE/MODIFY

create jwk-config [name] modify jwk-config [name]

options:

alg-type [none | HS256 | HS384 | HS512 | RS256 | RS384 | RS512 | ES256 | ES384]
app-service [[string] | none]
auto-generated [enabled | disabled]
cert [certificate-name | none]
cert-chain [chain-name | none]
cert-key [key-name | none]

key-type [rsa | octet | elliptic-curve]
key-use [signing]
modulus [[string] | none]
passphrase [[string] | none]
public-exponent [[string] | none]
shared-secret [[string] | none]
use-client-secret [true | false]
x-coordinate [[string] | none]
y-coordinate [[string] | none]

edit jwk-config [[[name] | [glob] | [regex]] ...]

options:

all-properties
non-default-properties
one-line

DISPLAY

list jwk-config

list jwk-config [[[name] | [glob] | [regex]] ...]

```
show running-config jwk-config
show running-config jwk-config [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete jwk-config [name]
```

DESCRIPTION

You can use the jwk-config component to configure a cryptographic JSON Web Key. This key may be used by the Authorization server to sign JSON Web Tokens or by the Client/Resource Server to verify the JSON Web Token signature.

EXAMPLES

```
create jwk-config myJwk {
  alg-type RS256
  key-id b2719f31c6bale5fe664fbb1bf0f7c05b3d3a0a1
  modulus ovtSwEWv9Q97JbB5Knfq4iAn8gl-ONzsFoxEasbh9-14CgeTImIXH31cOxu5tjVjAxeFifPW9w8EdEa-o8kUSJ40Fp2qMRN9wFAHmu5pm5
  public-exponent AQAB
}
```

Creates a JSON Web Key named myJwk that uses algorithm RS256.

```
create jwk-config myJwk {
  alg-type RS256
  key-id b2719f31c6bale5fe664fbb1bf0f7c05b3d3a0a1
  cert myCrt.crt
  cert-key myKey.key
}
```

Creates a JSON Web Key named myJwk that will automatically generate other fields based on the values in 'cert' and 'cert-key'. This JSON Web Key uses algorithm RS256 and can be used by the Authorization server to sign JSON Web Tokens.

```
list jwk-config
```

Displays a list of registered JSON Web Keys.

```
delete jwk-config myJwk
```

Deletes the JSON Web Key myJwk

OPTIONS

alg-type
Specifies which cryptographic algorithm is used by this JSON Web Key. The default value is none.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auto-generated
Specifies whether this key was created manually or generated through OpenID Connect metadata discovery. The default value is false.

cert Specifies the certificate this JSON Web Key uses to verify the JWT. Values derived from this field are a part of the JWKS endpoint response.

cert-chain
Specifies the certificate chain this JSON Web Key uses to validate the certificate in the cert field. Values derived from this field are a part of the JWKS endpoint response.

cert-key
Specifies the certificate key this JSON Web Key uses to sign the JWT.

cert-thumbprint-sha1
Specifies the base64url-encoded SHA-1 thumbprint of the DER encoding of X.509 certificate. If the 'cert' field is present, this value is auto-generated.

cert-thumbprint-sha256
Specifies the base64url-encoded SHA-256 thumbprint of the DER encoding of X.509 certificate. If the 'cert' field is present, this value is auto-generated.

curve
Specifies the curve used by the Elliptic Curve JSON Web Key. If the 'cert' field is present, this value is auto-generated.

include-x5c
Specifies whether or not JWKS endpoint response contains a chain of one or more PKIX certificates. The default value is false.

key-id
Specifies the parameter to identify a specific JSON Web Key.

key-type
Specifies the cryptographic algorithm family used by the JSON Web Key. This setting is required. The default value is rsa.

key-use
Specifies whether the JSON Web Key is used for signature generation and verification. At this time, the only supported

value is signing.

modulus

Specifies the modulus value for the RSA public key in base64url-encoded format. If the 'cert' field is present, this value is auto-generated.

partition

Displays the partition within which the component resides.

passphrase

Specifies the passphrase used to encrypt the certificate key provided in 'cert-key' field.

public-exponent

Specifies the exponent value for the RSA public key in base64url-encoded format. If the 'cert' field is present, this value is auto-generated.

shared-secret

Specifies the shared secret for the symmetric JSON Web Key when 'key-type' is set to octet.

use-client-secret

Specifies that this JSON Web Key uses client-secret instead of shared-secret. This field is relevant only when key-type is set to octet. The default value is false.

x5c Specifies a chain of one or more PKIX certificates represented as a JSON array of certificate value strings. The JSON array is generated using 'cert' and 'cert-chain' field values.

x-coordinate

Specifies the x coordinate for the Elliptic Curve point in base64url-encoded format. If the 'cert' field is present, this value is auto-generated.

y-coordinate

Specifies the y coordinate for the Elliptic Curve point in base64url-encoded format. If the 'cert' field is present, this value is auto-generated.

DELETE
delete jwt-config [name]

DESCRIPTION
  You can use jwt-config component for JWT config management to be used
  by Client/RS.

EXAMPLES
  create jwt-config myJwt {
    allowed-keys {
      myJwk1 { }
      myJwk2 { }
      myJwk3 { }
    }
    allowed-signing-algorithms { RS256 }
    issuer https://abc.com
  }

  Creates a JSON web token named myJwt that allows signing algorithm
  RS256 and JSON web keys myJwk1, myJwk2, myJwk3 and the issuer is
  https://abc.com.

  list jwt-config

  Displays a list of registered JSON web tokens.

  delete jwt-config myJwt

  Deletes the JSON web token myJwt.

OPTIONS
  access-token-expires-in
  Specifies the number of minutes the access token should live.
  Default value is 0, which means the token never expires.

  allowed-keys
  Specifies the list of allowed JSON web keys for the token.

  allowed-signing-algorithms
  Specifies the list of allowed signing algorithms for the token.

  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  audience
  Specifies the audience for the token.

  auto-generated
  Specifies whether this token was configured manually or was
  generated through auto-discovery. This is a read-only attribute.

  blacklist-access-tokens
  Specifies key-value-list that can be used to blacklist tokens
  based on the key and the list of values for that key.

  blocked-keys
  Specifies the list of blocked JSON web keys for the token.

  blocked-signing-algorithms
  Specifies the list of blocked signing algorithms for the token.

  issuer
  Specifies the issuer of the token.

  jwks-uri
  Specifies the location of public signing keys for an OAuth
  Provider. This field is read-only.

  use-jwt-provider-list-settings
  Specifies whether the settings configured in jwt-provider-list of
  which this JWT config is a part, should be used. The default value
  is true.

```

apm oauth jwt-provider-list

NAME
jwt-provider-list - Configure a list of providers for JSON web token management to be used by Client/RS.

MODULE
apm oauth

SYNTAX
Configure the jwt-provider-list component within the oauth module using the following syntax.

CREATE/MODIFY
create jwt-provider-list [name] modify jwt-provider-list [name]
options:
access-token-expires-in [integer]
app-service [[string] | none]
providers [add | delete | none | replace-all-with] {
[provider-name]
}

edit jwt-provider-list [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line

DISPLAY
list jwt-provider-list
list jwt-provider-list [[[name] | [glob] | [regex]] ...]
show running-config jwt-provider-list
show running-config jwt-provider-list [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line

DELETE
delete jwt-provider-list [name]

DESCRIPTION
You can use the jwt-provider-list component to configure a list of OAuth Providers on Client/RS. A provider list enables a single OAuth Scope agent in an access policy to validate tokens issued by multiple OAuth providers.

EXAMPLES
create jwt-config myProviderList {
providers {
myProvider1 { }
myProvider2 { }
myProvider3 { }
}
}

Creates a Provider list named myProviderList with Providers myProvider1, myProvider2 and myProvider3.

list jwt-provider-list

Displays a list of Provider lists.

delete jwt-provider-list myProviderList

Deletes the Provider List myProviderList.

OPTIONS
access-token-expires-in
Specifies the number of minutes the JSON web token should live. Default value is 0, which means the token never expires.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

providers
Specifies the list of providers that can be used by a single OAuth

Scope agent in an access policy to validate tokens issued by multiple OAuth providers.

SEE ALSO
COPYRIGHT

BIG-IP 2017-06-20 apm oauth jwt-provider-list(1)

apm oauth oauth-claim

NAME
oauth-claim - Manages claims for OAuth Authorization Server.

MODULE
apm oauth

SYNTAX
Configure the oauth-claim component within the oauth module using the following syntax.

CREATE/MODIFY

```
create oauth-claim [name]
modify oauth-claim [name]
  options
    app-service [[string] | none]
    claim-description [[string] | none]
    claim-name [string]
    claim-value [[string] | none]
```

```
edit oauth-claim [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
```

DISPLAY

```
list oauth-claim
list oauth-claim [ [ [name] | [glob] | [regex] ] ... ]
show running-config oauth-claim
show running-config oauth-claim [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
```

DELETE

```
delete oauth-claim [name]
```

DESCRIPTION

You can use the oauth-claim component to create and manage claims that provide different levels of access control based on end user's role or any other criteria.

EXAMPLES

```
create oauth-claim profileClaim {
  claim-description "Employee Profile"
  claim-name profile
  claim-value https://company.com/username
}
```

Creates a claim named profileClaim with claim-name set to profile and corresponding value being https://company.com/username.

```
list oauth-claim
```

Displays a list of OAuth Claims.

```
delete oauth-claim profileClaim
```

Deletes the OAuth Claim named profileClaim.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

[name]

Specifies the name of the OAuth Claim object. This setting is required.

claim-description
Specifies the description of the claim.

claim-name
Specifies the name of the claim.

claim-value
Specifies the value of the claim. This value can be any string or session variable.

options:
  all-properties
  non-default-properties
  one-line
```

DELETE

```
delete oauth-client-app [name]
```

DESCRIPTION

You can use the `oauth-client-app` component to register and manage client applications that will make protected resource requests to the OAuth Authorization server on behalf of the resource owner and with its authorization.

EXAMPLES

```
create oauth-client-app myClientApplication {
  app-description "Test App is an application that tests all grant types."
  app-name "Test App"
  grant-code enabled
  grant-password enabled
  grant-token enabled
  logo-url "https://abc.cloud.net/www/public/assets/images/logos/testapp.png"
  redirect-uris add { https://vml.lab.fp.f5net.com/oauth2/f5_test.php }
  scopes add { scope1 scope2 }
  website-url "https://www.test.com"
  use-profile-token-mgmt-settings false
  audience add { rs1 rs2 }
  jwt-access-token-claims add { claim1 claim2 }
}
```

Creates a client application named `myClientApplication` that will use the generated client credentials to send requests to this Authorization server. It can send token requests using any of the three supported grant types (authorization code, resource owner password credentials or implicit) and uses the default authentication type `"secret"`.

The authorization server will use the configured redirect uri to re-direct back to the client. The client application is associated with configured scopes named `scope1` and `scope2`.

The authorization server will not use the token management settings from the profile, and hence it will use the configured audience `rs1` and `rs2` and claim `claim1` and `claim2` values when a JWT access token is returned to the client.

```
list oauth-client-app
```

Displays a list of registered client-apps.

```
delete oauth-client-app myClientApplication
```

Deletes the OAuth client application `myClientApplication`

OPTIONS

access-token-lifetime
Specifies the number of minutes for which the access token should be valid. The default is 5 minutes.

app-description
Specifies a user-defined description for the client-app. The default value is none.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

audience
Specifies the audience claim for which the JWT access token is intended. This is a list of values. Each value in this list can be a string, URI, or session variable.

auth-code-lifetime
Specifies the number of minutes for which the authorization code should be valid. The default is 5 minutes.

auth-type
Specifies the authentication type the client will use when it makes requests to the Authorization Server. The default value is `secret` and other possible values are `none` and `certificate`.

client-cert-dn
Specifies the distinguished name of the client certificate that is used to validate a request from client when authentication type is set to `certificate`.

client-id
Specifies the client ID that uniquely identifies the client application. This field will be auto-generated and should not be specified or modified. Also, this entry cannot be edited once it has been generated.

client-secret
Specifies the client secret that is used to validate a request from client when authentication type is set to `secret`. This field

will be auto-generated and should not be specified or modified.

contact
Specifies a means to contact the developer of the client application.

customization-group
Specifies the customization settings for the client application.

generate-jwt-refresh-token
Specifies whether a refresh token should be generated along with the JWT access token. This is applicable only for "Authorization Code" and "Resource Owner Password Credentials" grant types. The default is true.

generate-refresh-token
Specifies whether a refresh token should be generated along with the access token. This is applicable only for "Authorization Code" and "Resource Owner Password Credentials" grant types.

grant-code
Specifies whether the client application will use the "authorization code" grant type. This grant type must be enabled in order to support hybrid flow in OpenID Connect. The default value is disabled. At least one grant type must be set to enabled.

grant-password
Specifies whether the client application will use the "resource owner password credentials" grant type. The default value is disabled.

grant-token
Specifies whether the client application will use the "implicit" grant type. The default value is disabled.

id-token-claims
Specifies the list of claims that are part of ID token.

id-token-lifetime
Specifies the number of minutes for which the ID token should be valid. The default is 5 minutes.

jwt-access-token-claims
Specifies the list of claims that are part of JWT access token.

jwt-access-token-lifetime
Specifies the number of minutes for which the JWT access token should be valid. The default is 5 minutes.

jwt-refresh-token-lifetime
Specifies the number of minutes for which the JWT refresh token should be valid. The default is 60 minutes.

logo-url
Specifies the path from which the logo of the client application can be displayed.

openid-connect
Specifies whether this client app supports OpenID Connect or not.

[name]
Specifies the name of the OAuth Client Application. This setting is required.

partition
Displays the partition within which the component resides.

redirect-uris
Specifies the list of re-direct URIs that the Authorization Server will use to re-direct back to the client after processing a request. This setting should have at least one entry if the client application uses the authorization code grant type or the implicit grant type.

refresh-token-lifetime
Specifies the number of minutes for which the refresh token should be valid. The default is 480 minutes.

refresh-token-usage-limit
Specifies the maximum number of times the access token can be obtained using the refresh token request. The default value is 64. Value 0 represents unlimited number of times.

regenerate-client-secret
Indicates a request to regenerate the client secret. Do not use other means to modify the secret.

reuse-access-token
Specifies whether an access token is reused or a new access token is generated when it is obtained using refresh token request. When the access token is reused, its expiry time is extended.

reuse-refresh-token
Specifies whether a refresh token is reused or a new refresh token is generated when it is obtained using refresh token request.

scopes
Specifies the list of scopes that is to be associated with the client application.

use-profile-token-mgmt-settings
Specifies whether the default settings that come from OAuth profile must be used or not.

userinfo-claims
Specifies the list of claims that are part of UserInfo.

website-url
Specifies the website URL of the client application.

apm oauth oauth-resource-server

NAME

oauth-resource-server - Manages resource servers to use with OAuth Authorization Server.

MODULE

apm oauth

SYNTAX

Configure the oauth-resource-server component within the oauth module using the following syntax.

CREATE/MODIFY

```
create oauth-resource-server [name]
modify oauth-resource-server [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  auth-type [none | secret | certificate]
  regenerate-resource-server-secret
  resource-server-cert-dn [[string] | none]
edit oauth-resource-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

DISPLAY

```
list oauth-resource-server
list oauth-resource-server [ [ [name] | [glob] | [regex] ] ... ]
show running-config oauth-resource-server
show running-config oauth-resource-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

DELETE

```
delete oauth-resource-server [name]
```

DESCRIPTION

You can use the oauth-resource-server component to register and manage resource servers that host resources that will be accessed by the user. Resource servers can accept and respond to protected resource requests using access tokens.

EXAMPLES

```
create oauth-resource-server myResourceServer {
  resource-server-cert-dn "/C=US/ST=CA/L=SJ/O=Company Name,Inc/OU=Engg/CN=user-name/emailAddress=username@company-doma
}
```

Creates a resource server named myResourceServer that will use the generated resource server credentials to send requests to the Authorization server. It uses the default authentication type "certificate".

```
list oauth-resource-server
```

Displays a list of registered resource servers.

```
delete oauth-resource-server myResourceServer
```

Deletes the OAuth resource server myResourceServer.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auth-type

Specifies the authentication type the resource server will use when it makes requests to the Authorization Server. The default value is certificate and other possible values are none and secret.

[name]

Specifies the name of the OAuth Resource Server. This setting is required.

description

Specifies the description of the OAuth Resource Server Object.

partition

Displays the partition within which the component resides.

regenerate-resource-server-secret

Indicates a request to regenerate the resource server secret. Do not use other means to modify the secret.

resource-server-cert-dn

Specifies the distinguished name of the resource server certificate that is used to validate a request from the resource server when authentication type is set to certificate.

resource-server-id

Specifies the resource server ID that uniquely identifies the resource server. This field will be auto-generated and should not be specified or modified. Also, this entry cannot be edited after it has been generated.

resource-server-secret

Specifies the resource server secret that is used to validate a request from the resource server when authentication type is set to secret. This field will be auto-generated and should not be specified or modified.

BIG-IP 2016-11-08apm oauth oauth-resource-server(1)

apm oauth oauth-scope

NAME

oauth-scope - Manages scopes for OAuth Authorization Server.

MODULE

apm oauth

SYNTAX

Configure the oauth-scope component within the oauth module using the following syntax.

CREATE/MODIFY

```
create oauth-scope [name]
modify oauth-scope [name]
options
  app-service [[string] | none]
  customization-group [[string] | none]
  scope-description [[string] | none]
  scope-name [string]
  scope-value [[string] | none]
```

```
edit oauth-scope [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
one-line
```

DISPLAY

```
list oauth-scope
list oauth-scope [ [name] | [glob] | [regex] ] ... ]
show running-config oauth-scope
show running-config oauth-scope [ [name] | [glob] | [regex] ] ... ]
options:
```

all-properties
non-default-properties
one-line

DELETE
delete oauth-scope [name]

DESCRIPTION

You can use the oauth-scope component to create and manage scopes that provide different levels of access control based on end user's role or any other criteria.

EXAMPLES

```
create oauth-scope myOAuthScope {  
  customization-group "company_my_oauth_scope"  
  scope-description "Group in company"  
  scope-name "profile"  
  scope-value "Product Development"  
}
```

Creates a scope named myOAuthScope that uses customization group company_my_oauth_scope to customize scope information in the OAuth Authorization page. It is configured with profile and Product Development as its name and value respectively.

```
list oauth-scope
```

Displays a list of OAuth Scopes.

```
delete oauth-scope myOAuthScope
```

Deletes the OAuth Scope named myOAuthScope.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the customization settings for the scope.

[name]
Specifies the name of the OAuth Scope. This setting is required.

partition
Displays the partition within which the component resides.

scope-description
Specifies the description of the scope.

scope-name
Specifies the name of the scope.

scope-value
Specifies the value of the scope. This value can be any string or session variable.

apm oauth purged-entries

NAME

Purged-Entries - Displays OAuth records purged from the respective database instance.

MODULE

apm oauth purged-entries

SYNTAX

Displays all the purged-entries within the oauth module using the syntax shown below.

DISPLAY

```
show purged-entries  
show purged-entries [db-instance]  
options:
```

```
all-properties
non-default-properties
one-line
recursive
output only properties:
  oauth_id [string]
  purged_time [string]
```

DESCRIPTION

You can use the purged-entries component to manage purged records.

EXAMPLES

```
show apm oauth purged-entries
Lists all the OAuth purged entries for the oauth default db
instance oauthdb. Also displays the total number of records
purged.
```

```
show apm oauth purged-entries db-instance test
Lists all the purged entries for the oauth db instance test. Also
displays the total number of records purged.
```

OPTIONS

```
db-instance
This specifies the db instance. If no value is specified, the
default db instance, oauthdb, is used.

oauth-id
Specifies oauth id. Displays in the output of the show command.

purged_time
Specifies the timestamp at which each record was purged. The
format is "YYYY-MM-DD HH:MM:SS". Displays in the output of the
show command.
```

SEE ALSO

apm oauth db-instance

COPYRIGHT

apm oauth token-details

NAME

Token-Details - Displays OAuth token properties and revokes access tokens and refresh tokens.

MODULE

apm oauth token-details

SYNTAX

Lists the token-details within the oauth module using the syntax shown in the following sections.

DISPLAY

```
list token-details
list token-details [ [ [oauth-id] | [app-name] | [client-id] | [offset] | [db-instance] ] ... ]
```

options:

```
all-properties
non-default-properties
one-line
recursive
```

output only properties:

```
access-token-status [[string] | none]
access-token-issued-at [[string] | none]
access-token-expires-at [[string] | none]
refresh-token-status [[string] | none]
refresh-token-issued-at [[string] | none]
refresh-token-expires-at [[string] | none]
grant-type [[string] | none]
user-agent [[string] | none]
```

show token-details

```
show token-details [ [ [app-name] | [client-id] | [offset] | [db-instance] ] ... ]
```

options:

```
field-fmt
recursive
```

REVOKE

```
revoke token-details [ [oauth-id client-id ] ]
```

DESCRIPTION

You can use the token-details component to manage oauth tokens.

EXAMPLES

`list apm oauth token-details`
Lists all the token details for the oauth default db instance of oauthdb.

`list apm oauth token-details db-instance test`
Lists all the token details for the oauth db instance test.

`list apm oauth token-details client-app myapp`
Lists all the token details for the client app myapp in the default db instance.

`show apm oauth token-details`
Shows the number of tokens in the oauth default db instance of oauthdb.

`show apm oauth token-details db-instance test`
Shows the number of tokens in oauth db instance test.

`show apm oauth token-details client-app myapp`
Shows the number of token for the client app myapp in default db instance.

`revoke apm oauth token-details`
93b225478484f0fa0addc527b2c50001d7e3yyb70c3eda99e56 client-id
ae8b6cd3708a5805e84ae48369ab0001d7eb70c1325c8d56
Revokes the access/refresh token for oauth id
93b225478484f0fa0addc527b2c50001d7eb70c3eda99e56 and client id
ae8b6cd3708a5805e84ae48369ab0001d7eb70c1325c8d56.

`revoke apm oauth token-details`
93b225478484f0fa0addc527b2c50001d7e3yyb70c3eda99e56 db-instance test
client-id ae8b6cd3708a5805e84ae48369ab0001d7eb70c1325c8d56
Revokes the access/refresh token for oauth id
93b225478484f0fa0addc527b2c50001d7eb70c3eda99e56 and client id
ae8b6cd3708a5805e84ae48369ab0001d7eb70c1325c8d56 in the db
instance test.

OPTIONS

`client-id`
Specifies the client id for which the token is generated. Must be specified for revoke command.

`app-name`
Specifies the app name for which the token is generated. This is an optional parameter for list and show commands.

`offset`
Specifies the number of tokens to skip before beginning to display the remaining tokens.

Example: `list apm oauth token-details offset 10`

This will return the tokens from the count of 11 and will skip the first 10.

`db-instance`
This specifies the db instance. If no value is specified, oauthdb (the default db instance) is used.

`user-id`
Specifies the user id for which the token is generated.

`oauth-id`
Specifies oauth id. Displays in the output of the list command.

`access-token-status`
Specifies the access token status, such as active,inactive,expired and revoked. Displays in the output of the list command.

`access-token-issued-at`
Specifies the access token issued timestamp. The format is "YYYY-MM-DD HH:MM:SS". Displays in the output of the list command.

`access-token-expires-at`
Specifies the access token expiry timestamp. The format is "YYYY-MM-DD HH:MM:SS". Displays in the output of the list command.

`refresh-token-status`
Specifies the refresh token status such as active,inactive,expired and revoked. Displays in the output of the list command.

`refresh-token-issued-at`
Specifies the refresh token issued timestamp. The format is "YYYY-MM-DD HH:MM:SS". Displays in the output of the list command.

`refresh-token-expires-at`
Specifies the refresh token expiry timestamp. The format is "YYYY-MM-DD HH:MM:SS". Displays in the output of the list command.

`grant-type`
Specifies the grant type; valid values are ropc, implicit and auth-code. Displays in the output of the list command.

`user-agent`
Specifies the user agent information for the token. Displays in the output of the list command.

apm policy access-policy

NAME
access-policy - Manages an access policy.

MODULE
apm policy

SYNTAX
Warning: F5 Networks recommends that you use the visual policy editor in the Configuration utility to create and manage access policies. If you are using tmsh scripts to create an access policy, please do the following:

1. Create transaction.
2. Create policy agents; each policy must include an ending agent type.
3. Create access policy items for start and end and attach the corresponding agents.
4. Create access policy and add all the policy items.
5. Create access profile with the corresponding access policy.
6. Submit transaction.

Failure to follow the above mentioned steps will result in error messages or invalid configuration. This sample script creates a policy with start and end agents only:

1. create cli transaction
2. create apm policy agent ending-allow /Common/rest_end_allow_ag { }
- 3a. create apm policy policy-item /Common/rest_end_allow { agents add { /Common/rest_end_allow_ag { type ending-allow
- 3b. create apm policy policy-item /Common/rest_end { caption Start color 1 rules { { caption fallback next-item /Commo
4. create apm policy access-policy /Common/rest { default-ending /Common/rest_end allow items add { rest_end allow { }
5. create apm profile access /Common/rest { accept-languages add { en } access-policy /Common/rest log-settings add {
6. submit cli transaction

apm policy agent aaa-active-directory

NAME
aaa-active-directory - Manages an AAA Active Directory(r) agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-active-directory component within the policy agent module using the following syntax.

```
CREATE/MODIFY
create aaa-active-directory [name]
modify aaa-active-directory [name]
options
  app-service [[string] | none]
  auth-max-logon-attempt [integer]
  fetch-nested-groups [true | false]
  fetch-primary-groups [true | false]
  hints [true | false]
  query-attrname [[string] | none]
  query-filter [[string] | none]
  server [[string] | none]
  trusted-domains [[string] | none]
  show-extended-error [true | false]
  type [query | auth | last]
```

upn [true | false]

DISPLAY

```
list aaa-ldap
list aaa-ldap [ [ [name] | [glob] | [regex] ] ... ]
show running-config aaa-ldap
show running-config aaa-ldap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  current-module
  non-default-properties
  one-line
  app-service
  partition
```

DELETE

```
delete aaa-active-directory ([name] | all)
```

DESCRIPTION

You can use the aaa-active-directory component to configure an AAA Active Directory agent.

EXAMPLES

```
create aaa-active-directory MyADQueryagent {query-filter "(be
sAMAccountName={session.logon.last.username})" type query server
"companyAD" }
Creates the query type AAA Active Directory agent named
MyADQueryagent that uses the (be
sAMAccountName={session.logon.last.username}) filter and the
companyAD AAA AD Server.

create agent aaa active MyADAuthagent { type auth server "companyAD" }
Creates the authorization type AAA Active Directory agent named
MyADAuthagent that uses the companyAD AAA AD server.

list aaa-active-directory all
Displays a list of AAA Active Directory agents and their
properties.

delete aaa-active-directory MyADagent
Deletes the MyADagent AAA Active Directory agent.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auth-max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

fetch-nested-groups
When enabled, the system administrator can retrieve the full list of groups that user belongs to, even if the retrieval privileges are nested through other groups to which the user belongs to directly. The default value is false.

fetch-primary-groups
When enabled, the system administrator can retrieve the primary group of a user, and use that name as a group in access policy item rules. The default value is false.

hints
When enabled, the system offers the user an option to create a hint that assists in remembering a password. The default value is false.

query-attrname
Specifies the attribute name that you are adding or deleting for the agent.

query-filter
Specifies the search criteria the system uses when querying an AAA Active Directory(r) server for authentication information. The system supports session variables as part of search query string.

[name]
Specifies the name of an AAA Active Directory agent. This setting is required.

partition
Displays the partition within which the component resides.

server
Specifies an AAA Active Directory server the system uses for Active Directory queries and authentication.

server
Specifies an AAA Active Directory Trusted Domains object that the system uses for Active Directory queries and authentication. This option requires upn option to be enabled

show-extended-error
Specifies to display a verbose error message. The default value is false.

type Specifies the type of AAA Active Directory agent. The default value is last.

query
Specifies that the agent makes a query against the AAA Active Directory Server to retrieve information in accordance with the query-filter and query-attributes options.

auth Specifies that the agent is an authentication agent only. It uses the AAA Active Directory Server, but only for authentication purposes. APM does not get any information from the Domain.

last
upn When enabled, APM supports the user principal name (UPN) naming style and process cross-domain authentication requests. Some examples of UPNs are: user@fqdn.of.domain.com, user@upnsuffix.com, and user@domain. The default value is false.

apm policy agent aaa-client-cert

NAME
aaa-client-cert - Manages an AAA Client Certification agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-client-cert component within the policy-agent module using the following syntax.

CREATE/MODIFY
modify aaa-client-cert [name]
create aaa-client-cert [name]
options:
app-service [[string] | none]
mode [request | require]

DISPLAY
list aaa-client-cert
list aaa-client-cert [[[name] | [glob] | [regex]] ...]
show running-config aaa-client-cert
show running-config aaa-client-cert [[[name] | [glob] | [regex]] ...]
options:
all
all-properties
current-module
non-default-properties
one-line
app-service
partition

DELETE
delete aaa-client-cert [name]

DESCRIPTION
You can use this component to configure an AAA Client Certification agent.

EXAMPLES
create aaa-client-cert MyCCagent
Creates the AAA Client Certification agent named MyCCagent in the Common partition.

list aaa-client-cert all
Displays a list of AAA Client Certification agents.

delete aaa-client-cert MyCCagent
Deletes the MyCCagent AAA Client Certification agent.

OPTIONS
[name]
Specifies the name of an AAA client cert agent. This setting is required.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

mode Specifies the mode (request/require) for this certificate. The options are:

request

Specifies that the system requests a valid certificate from a client, but always authenticates the client.

require

Specifies that the system requires a client to present a valid certificate.

partition

Displays the partition within which the component resides.

apm policy agent aaa-crldp

NAME

aaa-crldp - Manages an AAA CRLDP (Constraint-Based Routed Label Distributed Protocol) agent.

MODULE

apm policy agent

SYNTAX

Configure the aaa-crldp component within the policy agent module using the following syntax.

CREATE/MODIFY

create aaa-crldp [name]

modify aaa-crldp [name]

options:

app-service [[string] | none]

server (| none)

DISPLAY

list aaa-crldp

list aaa-crldp [[[name] | [glob] | [regex]] ...]

show running-config aaa-crldp

show running-config aaa-crldp [[[name] | [glob] | [regex]] ...]

options:

all

all-properties

app-service

current-module

non-default-properties

one-line

partition

DELETE

delete aaa-crldp [name]

DESCRIPTION

You can use the aaa-crldp component to create and manage an AAA CRLDP agent.

EXAMPLES

create aaa-crldp MyCCagent

Creates an AAA CRLDP agent named MyCCagent in the Common partition.

list aaa-crldp all

Displays a list of AAA CRLDP agents.

delete aaa-crldp MyCCagent

Deletes the MyCCagent AAA CRLDP agent.

OPTIONS

[name]

Specifies the name of an agent that you want to display or delete. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

server
Specifies the name of the server on which this agent resides. This option is required.

apm policy agent aaa-http

NAME
aaa-http - Manages an AAA HTTP agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-http component within the policy agent module using the following syntax.

CREATE/MODIFY
create aaa-http [name]
modify aaa-http [name]
options
app-service [[string] | none]
max-logon-attempt [integer]
server [[string] | none]

DISPLAY
list aaa-http
list aaa-http [[[name] | [glob] | [regex]] ...]
show running-config aaa-http
show running-config aaa-http [[[name] | [glob] | [regex]] ...]
options:
all
all-properties
current-module
non-default-properties
one-line
app-service
partition

DELETE
delete aaa-http [name]

DESCRIPTION
You can use the aaa-http component to configure an AAA HTTP agent.

EXAMPLES
create aaa-http MyCCagent
Creates the aaa-http agent named MyCCagent in the Common partition.

list all aaa-http
Displays a list of aaa-http agents.

delete aaa-http MyCCagent
Deletes the MyCCagent aaa-http agent.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system

allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

[name]

Specifies the name of an AAA HTTP agent. This setting is required.

partition

Displays the partition within which the component resides.

server

Specifies which AAA HTTP server the system uses for Active Directory queries and authentication.

app-service

partition

DELETE

delete aaa-ldap [name]

DESCRIPTION

Use this component to create, modify, display, or delete an AAA LDAP agent.

EXAMPLES

```
create aaa-ldap MyLDAPagent { user-dn
```

```
"cn={session.logon.last.username},cn=users,dc=lab,dc=fp,dc=com" type
```

```
auth server "companyLDAP" } aaa-ldap MyLDAPagent { search-dn
```

```
"cn=users,dc=lab,dc=fp,dc=com" filter
```

```
"(SAMAccountName={session.logon.last.username})" type auth server
```

```
"companyLDAP" }
```

Creates the authorization type AAA LDAP agent named MyLDAPagent

that is associated with the companyLDAP server that uses the

cn={session.logon.last.username},cn=users,dc=lab,dc=fp,dc=f5net,dc=com

user domain name, the cn=users,dc=lab,dc=fp,dc=com search domain,

and the (SAMAccountName=%{{session.logon.last.username}}) filter.

```
create aaa-ldap MyLDAPagent { search-dn "cn=users,dc=lab,dc=fp,dc=com"
  filter "(SAMAccountName=%{{session.logon.last.username}})" type query
  server "companyLDAP" }
```

Creates the query type AAA LDAP agent named MyLDAPagent that is associated with the companyLDAP server that uses the cn=users,dc=lab,dc=fp,dc=com search domain and the (SAMAccountName=%{{session.logon.last.username}}) filter.

```
create aaa-ldap MyLDAPagent { user-dn
  "cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=com" type
  modify modify-type add server "companyLDAP" ldapmod-attributes add {
  objectClass { mod-op add mod-values add { top person
  organizationalPerson user } } cn { mod-op add mod-values add { demo } }
  }
```

Creates the modify type AAA LDAP agent named MyLDAPagent that is associated with the companyLDAP server that uses the cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=f5net,dc=com user domain name, the add modify type, and the ldapmod attributes

```
create aaa-ldap MyLDAPagent { user-dn
  "cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=com" type
  modify modify-type modify server "companyLDAP" ldapmod-attributes add {
  givenName { mod-op replace mod-values add { demo } } }
```

Creates the modify type AAA LDAP agent named MyLDAPagent that is associated with the companyLDAP server that uses the cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=f5net,dc=com user domain name, the modify modify type, and the ldapmod attributes which uses givenName modify attribute replace mod operation and the demo mod values

```
create aaa-ldap MyLDAPagent { user-dn
  "cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=com" type
  modify modify-type delete server "companyLDAP" }
```

Creates the modify type AAA LDAP agent named MyLDAPagent that is associated with the companyLDAP server that uses the cn=%{{session.logon.last.username}},cn=users,dc=lab,dc=fp,dc=f5net,dc=com user domain name, the delete modify type

```
list aaa-ldap
Displays a list of AAA LDAP agents.
```

```
delete aaa-ldap MyLDAPagent
Deletes the MyLDAPagent AAA LDAP agent.
```

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

attr-name

Adds an attribute name to the agent or deletes an attribute name from the agent.

group-member-scope

Specifies the scope of user lookup for a group. When the search returns a group, this attribute specifies whether to also look up the members of the group. The options are:

none No members required.

direct Only direct members required.

all All members required. This includes those that derive membership in this group through membership in other groups and those that are direct members.

group-membership-scope

Specifies the scope of group lookup for a user or a group. When the search returns a user or a group, this attribute specifies whether to also look up the groups to which this user or group belong. The options are:

none No groups required.

direct Only the groups to which the current user or group belong directly are required.

all All groups required. This includes the groups to which the user or the group belong directly and the groups to which the user or group belong indirectly (through membership in another group).

filter

Specifies the LDAP filter that APM uses when querying an AAA LDAP server for authentication information. You must use the filter option with the search-dn option.

max-logon-attempt

Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

[name]

Specifies the name of an AAA LDAP agent. This setting is required.

partition

Displays the partition within which the component resides.

search-dn

Specifies the base domain name that APM uses for internal LDAP search operations. You must use the search-dn option with the filter option.

server
Specifies the AAA LDAP server that the system uses for LDAP queries and authentication.

show-extended-error
Specifies to display a verbose error message. The default value is false.

type Specifies a type of AAA LDAP agent. This setting is required. The default is last.

user-dn
Specifies the fully qualified domain name of the Access Policy Manager. F5 Networks recommends that you specify this value in lower case and without spaces for compatibility with some specific LDAP servers. The specific content of this string depends on your directory layout.

BIG-IP 2016-03-14 apm policy agent aaa-ldap(1)

apm policy agent aaa-oauth

NAME
aaa-oauth - Manages an AAA OAuth(r) agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-oauth component within the policy agent module using the following syntax.

```
CREATE/MODIFY
create aaa-oauth[name]
modify aaa-oauth [name]
options:
  app-service [[string] | none]
  auth-redirect-request [name]
  grant-type [authorization-code | password]
  redirection-uri [string]
  scope [[string] | none]
  scope-data-request [name]
  server [name]
  token-refresh-request [name]
  token-request [name]
  type [client | scope]
  validation-scopes-request [name]
```

```
DISPLAY
list aaa-oauth
list aaa-oauth [ [name] | [glob] | [regex] ] ... ]
show running-config aaa-oauth
show running-config aaa-oauth [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  current-module
  non-default-properties
  one-line
  app-service
  partition
```

```
DELETE
delete aaa-oauth [name]
```

DESCRIPTION
Use this component to create, modify, display, or delete an OAuth Client or OAuth Scope agent.

EXAMPLES
create aaa-oauth MyGoogleClient { auth-redirect-request
 GoogleAuthRedirectRequest grant-type authorization-code scope
 "https://www.googleapis.com/auth/userinfo.email
 https://www.googleapis.com/auth/userinfo.profile" server myGoogleServer
 token-request GoogleTokenRequest type client validation-scopes-request
 GoogleValidationScopesRequest } Creates the OAuth Client agent to
 acquire an access_token from Google authorization server using

authorization-code grant type. Defines two scopes. The user's permission will be requested for the scopes.
create aaa-oauth MyGoogleScope { scope-data-request {
 https://www.googleapis.com/auth/userinfo.profile { request
 GoogleScopeUserInfoProfileRequest } } server myGoogleServer type scope
 validation-scopes-request GoogleValidationScopesRequest }
Creates OAuth Scope agent to get the list of scopes associated with the access_token, and defines the scope-data-request to retrieve more information about user identity if the access_token contains the scope
"https://www.googleapis.com/auth/userinfo.profile".

list aaa-oauth
Displays a list of OAuth agents.

delete aaa-oauth MyGoogleScope
Deletes the MyGoogleScope OAuth agent.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auth-redirect-request
OAuth Request name to be used for user redirect in order to obtain authorization code.

grant-type
Specifies grant type that should be used to request an access_token.

redirection-uri
Specifies redirection URI. The redirection URI is used by the Authorization Server to redirect user back after authentication. The URI is a property of client application registered at authorization server. This option is used along with 'authorization-code' grant type only.

scope
The list of scopes to request user's permission for.

scope-data-request
Defines OAuth Request to obtain additional information from the resource server for the specified scope, using access_token.

server
Specifies OAuth Server that represents the authorization server to work with.

token-refresh-request
Specifies OAuth Request to refresh an expired access_token.

token-request
Specifies OAuth Request to request an access_token.

type Type of the OAuth agent. Available options are: client or scope. Default value client. The type cannot be changed for an existing OAuth agent.

validation-scopes-request
Specifies OAuth Request to validate the access_token (when agent type is client) or to retrieve list of scopes associated with the access_token (when agent type is scope).

apm policy agent aaa-ocsp

NAME

aaa-ocsp - Manages an AAA OCSP (Online Certificate Status Protocol) agent.

MODULE

apm policy agent

SYNTAX
Configure the aaa-ocsp component within the policy agent module using the following syntax.

CREATE/MODIFY
create aaa-ocsp [name]
modify aaa-ocsp [name]
options:
 app-service [[string] | none]
 certificate-type
 ocsp-responder

DISPLAY
list aaa-ocsp
list aaa-ocsp [[name] | [glob] | [regex]] ...]
show running-config aaa-ocsp
show running-config aaa-ocsp [[name] | [glob] | [regex]] ...]
options:
 all
 all-properties
 current-module
 non-default-properties
 one-line
 app-service
 partition

DELETE
delete aaa-ocsp [name]

DESCRIPTION
Use this command to create, modify, display, or delete an AAA OCSF agent.

EXAMPLES
create aaa-ocsp MyCCagent
Creates the AAA OCSF agent named MyCCagent in the Common partition.

list aaa-ocsp all
Displays a list of AAA OCSF agents.

delete aaa-ocsp MyCCagent
Deletes the MyCCagent AAA OCSF agent.

OPTIONS
[name]
Specifies the name of an agent that you want to display or delete. This setting is required.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

certificate-type
Specifies the type of certificate to check against OCSF responder. The value can be either user or machine. The default value is user.

ocsp-responder
Specifies which OCSF responder object to use to validate a certificate.

partition
Displays the partition within which the object resides.

apm policy agent aaa-radius

NAME
aaa-radius - Manages an AAA RADIUS agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-radius component within the policy agent module using

the following syntax.

```
CREATE/MODIFY
create aaa-radius [name]
modify aaa-radius [name]
options:
  app-service [[string] | none]
  max-logon-attempt
  password-source [[string] | none]
  server ( | none)
  show-extended-error (true | false)
  username-source [[string] | none]

DISPLAY
list aaa-radius
list aaa-radius [ [name] | [glob] | [regex] ] ... ]
show running-config aaa-radius
show running-config aaa-radius [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  current-module
  non-default-properties
  one-line
  app-service
  partition

DELETE
delete aaa-radius [name]
```

DESCRIPTION
Use this command to create, modify, display, or delete an AAA RADIUS agent.

EXAMPLES
create aaa-radius Myradiusagent {server "companyradius"}
Creates an AAA RADIUS agent named Myradiusagent that is associated with the companyradius server.

list aaa-radius
Displays a list of AAA RADIUS agents.

delete aaa-radius Myradiusagent
Deletes the Myradiusagent AAA RADIUS agent.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

[name]
Specifies the name of an AAA RADIUS agent. This setting is required.

partition
Displays the partition within which the object resides.

password-source
Specifies the session variable name from which RADIUS agent should read the password. The default value is `#{session.logon.last.password}`.

server
Specifies the AAA RADIUS server that the system uses for RADIUS queries and authentication.

show-extended-error
Specifies to display a verbose error message. The default value is false.

username-source
Specifies the session variable name from which RADIUS agent should read the username. The default value is `#{session.logon.last.username}`.

SEE ALSO

apm policy agent aaa-saml

NAME
aaa-saml - Manages a AAA SAML agent.

MODULE
apm policy agent

SYNTAX
Configure the aaa-saml component within the policy agent module using the following syntax.

CREATE/MODIFY
create aaa-saml [name]
modify aaa-saml [name]
options:
 app-service [[string] | none]
 attr-consuming-service-session-var (| none)
 attribute-consuming-service (| none)
 server (| none)

DISPLAY
list aaa-saml
list aaa-saml [[name] | [glob] | [regex]] ...]
show running-config aaa-saml
show running-config aaa-saml [[name] | [glob] | [regex]] ...]
options:
 all
 all-properties
 current-module
 non-default-properties
 one-line
 app-service
 partition

DELETE
delete aaa-saml [name]

DESCRIPTION
Use this command to create, modify, display, or delete a AAA SAML agent.

EXAMPLES
create aaa-saml Mysamagent {server "companysaml"}
Creates a AAA SAML agent named Mysamagent that is associated with the companysaml server.

list aaa-saml
Displays a list of AAA SAML agents.

delete aaa-saml Mysamagent
Deletes the Mysamagent AAA SAML agent.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

attr-consuming-service-session-var
Specifies the session variable used as the source for the attribute consuming service index. The index will be included in the SAML authentication request generated. The IdP maps the index to the list of attributes derived from the metadata previously shared and returns those attributes in the SAML Response. attr-consuming-service-session-var and attribute-consuming-service cannot be configured at the same time.

attribute-consuming-service
Specifies the name of one of the attribute consuming services associated with the server. The index associated with the selected attribute consuming service will be included in the SAML authentication request generated. The IdP maps the index to the list of attributes derived from the metadata previously shared and returns those attributes in the SAML Response. attribute-consuming-service and attr-consuming-service-session-var cannot be configured at the same time.

partition
Displays the partition within which the object resides.

server
Specifies the AAA SAML server that the system uses for SAML queries and authentication.

edit aaa-securid | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list aaa-securid
list aaa-securid [[name] | [glob] | [regex]] ...]
show running-config aaa-securid
show running-config aaa-securid [[name] | [glob] | [regex]] ...]
options:
 all
 all-properties
 current-module
 non-default-properties
 one-line
 app-service
 partition

DELETE
delete aaa-securid [name]

DESCRIPTION
You can use the aaa-securid component to create and manage an AAA SecurID agent.

EXAMPLES
create aaa-securid mySecuridAgent { server rsal_106 }
Creates an AAA SecurID agent named mySecuridAgent that is associated to AAA RSA Server rsal_106.

list all aaa-securid
Displays a list of AAA SecurID agents.

delete aaa-securid MyCCagent
Deletes the MyCCagent AAA Client Certification agent.

OPTIONS
[name]
Specifies the name of an agent that you want to display or delete. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

password-source
Specifies the session variable name from which RSA SecurID agent should read the password. The default value is `#{session.logon.last.password}`.

server
Specifies the AAA RSA SecurID server that the system uses for LDAP queries and authentication.

show-extended-error
Specifies to display a verbose error message. The default value is `false`.

username-source
Specifies the session variable name from which RSA SecurID agent should read the username. The default value is `#{session.logon.last.username}`.

apm policy agent acct-radius

NAME
acct-radius - Manages a RADIUS Accounting agent.

MODULE
apm policy agent

SYNTAX
Configure the acct-radius component within the policy agent module using the following syntax.

```
CREATE/MODIFY
create acct-radius [name]
modify acct-radius [name]
options:
  app-service [[string] | none]
  server [[string] | none]
  username-source [[string] | none]

edit acct-radius | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list acct-radius
list acct-radius [ [name] | [glob] | [regex] ] ... ]
show running-config acct-radius
show running-config acct-radius [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  current-module
  non-default-properties
  one-line
  app-service
  partition
```

```
DELETE
delete acct-radius [name]
```

DESCRIPTION
You can use the acct-radius component to create and manage a RADIUS Accounting agent.

EXAMPLES
create acct-radius MyRADIUSagent { server "MyRADIUS" }
Creates the MyRADIUSagent RADIUS Accounting agent that is associated with the MyRADIUS server.

```
list acct-radius
Displays a list of RADIUS Accounting agents and the servers associated with the agents.
```

```
delete acct-radius MyRADIUSagent
Deletes the MyRADIUSagent RADIUS Accounting agent.
```

OPTIONS

`[name]`
Specifies the name of a RADIUS Accounting server. This setting is required.

`partition`
Displays the partition within which the component resides.

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`server`
Specifies a RADIUS Accounting server the system uses to send RADIUS Accounting START and RADIUS Accounting STOP messages. This option is required.

`username-source`
Specifies the session variable name from which RADIUS Accounting agent should read the username. The default value is `%{session.logon.last.username}`.

apm policy agent acct-tacacsplus

NAME

`acct-tacacsplus` - Manages a TACACS+(r) Account agent.

MODULE

`apm policy agent`

SYNTAX

Configure the `acct-tacacsplus` component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create acct-tacacsplus [name]
modify acct-tacacsplus [name]
options
  app-service [[string] | none]
  server [[string] | none]
```

DISPLAY

```
list acct-tacacsplus
list acct-tacacsplus [ [ [name] | [glob] | [regex] ] ... ]
show running-config acct-tacacsplus
show running-config acct-tacacsplus [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  current-module
  non-default-properties
  app-service
  partition
```

DELETE

```
delete acct-tacacsplus [name]
```

DESCRIPTION

You can use the `acct-tacacsplus` component to configure a TACACS+ Account agent.

EXAMPLES

```
create acct-tacacsplus MyADQueryagent { server "companyAD" }
Creates the agent type TACACS+ Account named MyADQueryagent that uses the companyAD server.
```

```
list acct-tacacsplus all
Displays a list of TACACS+ Account agents and the server associated with each agent.
```

```
delete acct-tacacsplus MyADagent
Deletes the MyADagent TACACS+ Account agent.
```

OPTIONS

`[name]`
Specifies the name of an acct-tacacsplus agent. This setting is required.

`partition`
Displays the partition within which the component resides.

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`server`
Specifies the TACACS+ Account server that the system uses for queries and authentication.

apm policy agent decision-box

NAME

decision-box - Manages a Decision Box agent.

MODULE

apm policy agent

SYNTAX

Configure the decision-box component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create decision-box [name]
modify decision-box [name]
options
  app-service [[string] | none]
  customization-group [name]
```

DISPLAY

```
list decision-box
list decision-box [ [ [name] | [glob] | [regex] ] ... ]
show running-config decision-box
show running-config decision-box [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

DELETE

```
delete decision-box ([name] | all)
```

DESCRIPTION

You can use the decision-box component to configure a Decision Box agent.

EXAMPLES

```
create dynamic-acl MyADQueryagent
Creates the Decision Box agent named MyADQueryagent.
```

```
list decision-box all
Displays a list of Decision Box agents.
```

```
delete decision-box MyADagent
Deletes the MyADagent Decision Box agent.
```

OPTIONS

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the name of the existing customization group to which the agent belongs.

[name]
Specifies the name of a Decision Box agent. This setting is required.

partition
Displays the partition within which the component resides.

BIG-IP 2012-10-19 apm policy agent decision-box(1)

apm policy agent dynamic-acl

NAME
dynamic-acl - Manages a Dynamic ACL agent.

MODULE
apm policy agent

SYNTAX
Configure the dynamic-acl component within the policy agent module using the following syntax.

```
CREATE/MODIFY
create dynamic-acl [name]
modify dynamic-acl [name]
options
  app-service [[string] | none]
  entries [ add | delete | modify | none | replace-all-with]
```

```
DISPLAY
list dynamic-acl
list dynamic-acl [ [name] | [glob] | [regex] ] ... ]
show running-config dynamic-acl
show running-config dynamic-acl [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

```
DELETE
delete dynamic-acl [name]
```

DESCRIPTION
You can use the dynamic-acl component to create and manage a Dynamic access control list (acl) agent that parses ACL text input with a specified format from a specified session variable, assigns the parsed entry into a Dynamic ACL object, and assigns it into a current user session. An ACL is a set of restrictions associated with a resource or favorite that defines access for users and groups.

EXAMPLES
create dynamic-acl {
 { acl [format [f5 | cisco]] source
 } }>
Creates the Dynamic ACL agent named MyDynamicAclAgent.

```
list dynamic-acl
Displays a list of Dynamic ACL agents.
```

```
delete dynamic-acl MyDynamicAclAgent
Deletes the Dynamic ACL agent named MyDynamicAclAgent.
```

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

```
entries
Specifies the name of the entry to assign this dynamic access
```

control list.

[name]
Specifies the name of the Dynamic Acl agent. This setting is required.

partition
Displays the partition within which the component resides.

BIG-IP 2012-10-19 apm policy agent dynamic-acl(1)

apm policy agent ending-allow

NAME
ending-allow - Manages an Ending Allow agent.

MODULE
apm policy agent

SYNTAX
Configure the ending-allow component within the policy agent module using the following syntax.

CREATE/MODIFY
create ending-allow [name]
modify ending-allow [name]
options:
app-service [[string] | none]

DISPLAY
list ending-allow
list ending-allow [[[name] | [glob] | [regex]] ...]
show running-config ending-allow
show running-config ending-allow [[[name] | [glob] | [regex]] ...]
options:
all
all-properties
app-service
current-module
non-default-properties
one-line
partition

DELETE
delete ending-allow ([name] | all)

DESCRIPTION
Access policy endings indicate the final outcome of a branch of an access policy. An Allow ending is a successful ending in which the system displays the user's home page and grants access to a webtop connection.

EXAMPLES
create ending-allow MyEndingAllowAgent { }
Creates the Ending Allow agent named MyEndingAllowAgent.

list ending-allow
Displays a list of Ending Allow agents.

delete ending-allow MyEndingAllowAgent
Deletes the Ending Allow agent named MyEndingDeniedAgent.

OPTIONS
[name]
Specifies the name of an Ending Allow agent. This option is required.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

partition
Displays the partition within which the component resides.

SEE ALSO

BIG-IP 2012-10-19 apm policy agent ending-allow(1)

apm policy agent ending-deny

NAME
ending-deny - Manages an Ending Deny agent.

MODULE
apm policy agent

SYNTAX
Configure the ending-deny component within the policy agent module using the following syntax.

CREATE/MODIFY
create ending-deny [name]
modify ending-deny [name]
options
app-service [[string] | none]
customization-group [name]

DISPLAY
list ending-deny
list ending-deny [[[name] | [glob] | [regex]] ...]
show running-config ending-deny
show running-config ending-deny [[[name] | [glob] | [regex]] ...]
options:
all
all-properties
app-service
current-module
non-default-properties
one-line
partition

DELETE
delete ending-deny ([name] | all)

DESCRIPTION
Access policy endings indicate the final outcome of a branch of an access policy. The Logon Deny ending is the final result of an unsuccessful logon attempt (the failure could be caused by an incorrect logon attempt, a security requirement incompatibility, or the use of an unsupported device). Upon reaching a Logon Deny ending, the user sees an error message. You can use the ending-deny component to create and manage an Ending Deny agent.

EXAMPLES
create ending-deny MyEndingDenyAgent customization-group MyLogOffCG
Creates the Ending Deny agent named MyEndingDenyAgent that is associated with the MyLogOffCG customization group.

list ending-deny
Displays a list of Ending Deny agents.

delete ending-deny MyEndingDenyAgent
Deletes the Ending Deny agent named MyEndingDenyAgent.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the name of the existing customization-group to which the agent belongs. It enables you to customize the logon deny page. For example, you can indicate a specific reason for the denial of access. This setting is required, and the customization group that you assign must be of the type logout.

[name]
Specifies the name of an Ending Deny agent. This setting is required.

partition
Displays the partition within which the component resides.

BIG-IP 2012-10-19 apm policy agent ending-deny(1)

apm policy agent ending-redirect

NAME

ending-redirect - Manages an Ending Redirect agent.

MODULE

apm policy agent

SYNTAX

Configure the ending-redirect component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create ending-redirect [name]
modify ending-redirect [name]
options
  app-service [[string] | none]
  close-session [true | false]
  url [value]
```

DISPLAY

```
list ending-redirect
list ending-redirect [ [ [name] | [glob] | [regex] ] ... ]
show running-config ending-redirect
show running-config ending-redirect [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

DELETE

```
delete ending-redirect ([name] | all)
```

DESCRIPTION

The Redirect ending can be used to redirect the user, rather than allowing or denying a connection. It can also send a user directly to an update script or to different server or landing URI. Upon reaching a Redirect ending, the user sees a screen indicating that they are being redirected to a different URL. You can use the ending-redirect component to create and manage an Ending Redirect agent.

EXAMPLES

```
create ending-redirect MyEndingRedirectAgent { url
"http://www.myweb.com" }
Creates the Ending Redirect agent named MyEndingRedirectAgent that
redirects a connection to http://www.myweb.com.
```

=item

```
Creates an agent using the current protocol and the session
variable %{session.server.network.protocol}
```

```
list ending-redirect
Displays a list of Ending Redirect agents.
```

```
delete ending-redirect MyEndingRedirectAgent
Deletes the Ending Redirect agent named MyEndingRedirectAgent.
```

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

close-session

Redirects to the specified URI after closing the session if enabled. Otherwise, redirect to the specified URI without closing the session. The default is enabled.

[name]

Specifies the name of an Ending Redirect agent. This option is required.

url Specifies the URL to which the system redirects the original request. This option is required, and you must specify an absolute URL.

An absolute URL specifies the exact location of a file or directory on the Internet.

apm policy agent endpoint-check-machine-cert

NAME
endpoint-check-machine-cert - Manages an End-point Check Machine certificate agent.

MODULE
apm policy agent

SYNTAX
Configure the endpoint-check-machine-cert component within the apm policy agent module using the following syntax.

CREATE/MODIFY
create endpoint-check-machine-cert [name]
modify endpoint-check-machine-cert [name]
options:
allow-elevation [true | false]
app-service [[string] | none]
ca-profile-name [value]
issuer [value]
save-cert [true | false]
serial-number [integer]
store-location [machine | user]
store-name [value]
subject-alt-name [value]
subject-match-fqdn [value]

edit endpoint-check-machine-cert [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list endpoint-check-machine-cert
list endpoint-check-machine-cert [[[name] | [glob] | [regex]] ...]
show running-config endpoint-check-machine-cert
show running-config endpoint-check-machine-cert [[[name] | [glob] | [regex]] ...]
options:
all
all-properties
app-service
current-module
non-default-properties
one-line
partition

DELETE
delete endpoint-check-machine-cert [name]

DESCRIPTION
Endpoint security is a centrally-managed method of monitoring and maintaining client-system security.

The endpoint-check-machine-cert component checks for the presence of a valid machine certificate on Windows/Mac client systems during access policy validation.

EXAMPLES
create endpoint-check-machine-cert MyMCagent
Creates the Endpoint Check Machine certificate agent named MyMCagent in the Common partition.

list endpoint-check-machine-cert
Displays a list of Endpoint Check Machine certificate agents.

delete endpoint-check-machine-cert MyMCagent
Deletes the MyMCagent Endpoint Check Machine certificate agent.

OPTIONS

allow-elevation
Specifies that User Account Control (UAC) prompts are allowed during private key checking.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

ca-profile-name
Specifies the name of the certificate authority profile to validate the certificate.

issuer
Specifies the name used to match the issuer name in the machine certificate.

[name]
Specifies the name of an external logon page agent. This option is required.

partition
Displays the partition within which the component resides.

save-cert
Specifies to store the entire machine certificate in a session variable.

serial-number
Specifies the serial number used to match the serial number of the machine certificate.

store-location
Specifies the location of the certificate store on the client machine.

store-name
Specifies the name of the certificate store on the client machine.

subject-alt-name
Specifies the name used to match the subject-alt-name in the machine certificate.

subject-match-fqdn
Specifies if lookup must match fully qualified domain name (FQDN) in the machine certificate.

apm policy agent endpoint-check-software

NAME

endpoint-check-software - Manages an Endpoint Software Check agent.

MODULE

apm policy agent

SYNTAX

Configure the endpoint-check-software component within the apm policy agent module using the following syntax.

CREATE/MODIFY

```
create endpoint-check-software [name]
modify endpoint-check-software [name]
options:
  collect [ true | false ]
```

```

continuous-check [ true | false ]
type [ antivirus | firewall | patch-management | antispyware | peer-to-peer | hard-disk-encryption | health-agent
check-list-type [ required | allow | deny ]
items [ vendor_id | product_id | state | version | db-age | db-version | last-scan | missing-updates | platform ]

edit endpoint-check-software [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list endpoint-check-software
list endpoint-check-software [ [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-check-software
show running-config endpoint-check-software [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition

DELETE
delete endpoint-check-software ([name] | all)

DESCRIPTION
Endpoint security is a centrally-managed method of monitoring and
maintaining client-system security. You can use the endpoint-check-
software component to create and manage an agent that enforces
monitoring of various client-system security third party software.
Different types of third party software supported are described below
in options.

The configuration attributes in the items option are generic and
therefore for a given software type only certain items attributes are
useful, rest of the attributes are ignored even if they are configured.
For example: for type=peer-to-peer only vendor_id, product_id, state
and version are considered and rest of the items like db-age, db-
version etc are ignored. Following is the list of useful attributes
corresponding to the software type:

Common to all software type:
vendor_id, product_id, version, platform, state

antivirus & antispyware:
db-age, db-version, last-scan

patch-management:
missing-updates

EXAMPLES
create endpoint-check-software MyEndpointWCagent items state enabled
add
Creates the Endpoint Check Software agent named MyEndpointWCagent,
which verifies that the specified third party software on the
client is compliant with system administrators configuration,
which my just check for the installation or monitor the state of
the software

list endpoint-check-software
Displays a list of Endpoint Software Check agents.

delete endpoint-check-software MyEndpointWCagent
Deletes the Endpoint Software Check agent named MyEndpointWCagent.

OPTIONS
items
Adds items to or deletes items from an Endpoint Software Check
agent. You can specify the following attributes for the software:

check-list-type Specifies how the list of software should be
checked
required:
Client is required to have at least one of the software
configured in the list in order to pass the access policy.
And that software should satisfy all the configuration fields
e.g. state, version etc.

allow: Client is allowed to have any of the software
configured in the list but NOT any other than that, in order
to pass the access policy. List is treated as whitelist. A
given client software will not match unless it satisfies all
the configuration fields (e.g. state, version etc). NOTE: The
check will also be successful if client has no software
installed at all. List of software is treated as whitelist.

deny: Client should NOT have any software configured in the
list in order to pass the access policy. And that software
should satisfy all the configuration fields (e.g. state,
version etc). NOTE: The check will also be successful if
client has no software installed at all. List of software is
treated as blacklist.

db-age
Specifies the maximum age of the anti-virus/anti-spyware
database that you want an Endpoint Software Check agent to
verify the presence of on the client in order to allow the
access policy to pass.

db-version
Specifies the version of the anti-virus/anti-spyware database
that you want an Endpoint Software Check agent to verify the

```

presence of on the client in order to allow the access policy to pass.

product_id
Specifies the product ID of the software that you want an Endpoint Software Check agent to verify the presence of on the client in order to allow the access policy to pass.

vendor_id
Specifies the vendor ID of the software that you want an Endpoint Software Check agent to verify the presence of on the client in order to allow the access policy to pass.

NOTE: If none of the vendor id or product id is defined then check is performed for any of the software of given type. If both vendor id and product id are configured then, product id is ignored and only vendor id is considered. Vendor ID always takes precedence. A vendor can have many products. Each product (of every vendor) has unique ID assigned to them. Similarly, every vendor is assigned a unique ID too which is separate from product ID. If you want to check every software from a vendor then specify vendor_id only.

state
State means different things to different software type. The state can be enabled, disabled or unspecified. The default is unspecified.

antivirus and antispyware:
When the state is set to enabled or disabled, agent verifies that the specified antivirus/antispyware software has real time protection enabled or disabled on the client that is attempting to connect. When state is unspecified, it ignores the state.

patch-management:
When the state is set to enabled, agent verifies that the specified PM software is running on the client that is attempting to connect. When its set to unspecified, state of the software is ignored.

firewall:
When the state is enabled or disabled, agent verifies that the specified firewall software has real time protection enabled or disabled on the client that is attempting to connect. When state is unspecified, the software state is ignored.

peer-to-peer:
When the state is set to enabled agent verifies that the peer-to-peer software is running on the client that is attempting to connect. When state is unspecified, the agent only verifies that the software is installed or not.

hard-disk-encryption:
When the state is set to enabled agent verifies that all disk volumes are encrypted on the client that is attempting to connect. When the state is set to disabled agent verifies that system disk volume is encrypted on the client that is attempting to connect. When state is unspecified, the agent only verifies that the software is installed or not.

health-agent:
When the state is set to enabled agent verifies that endpoint client is compliant with the health policy set out by the site administrator.

version
Specifies the version of the software that you want an Endpoint Software Check agent to verify the presence of on the client in order to allow the access policy to pass.

last-scan
Specifies the maximum allowed duration without the full system scan of endpoint client that software agent can accept in order to allow the access policy to pass. It is specified in number of days.

missingupdates
Specifies the maximum number of allowed missing critical updates of the PM software at the endpoint client in order to allow the access policy to pass. Leave blank to ignore number of missing critical updates. Specify 0 to make sure endpoint client is up-to-date

platform
Specifies the platform. It could be any of the following: windows, linux, mac or any. The default is any.

type Its the type of the third party software to be monitored on the client system. It could be any of the following: antivirus, firewall, patch-management, antispyware, peer-to-peer, hard-disk-encryption, health-agent

collect
This setting is ignored.

continuous-check
Continuously check the items, and end the session if the result changes. The default is false.

[name]
Specifies the name of an Endpoint Software Check agent. This

option is required.

partition
Displays the partition within which the component resides.

apm policy agent endpoint-linux-check-file

NAME
endpoint-linux-check-file - Manages an Endpoint Linux Check File agent.

MODULE
apm policy agent

SYNTAX
Configure the endpoint-linux-check-file component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create endpoint-linux-check-file [name]
modify endpoint-linux-check-file [name]
options:
  continuous-check [ true | false ]
  app-service [[string] | none]
  files [ filename | md5 | modified | size ]
```

```
edit endpoint-linux-check-file [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list endpoint-linux-check-file
list endpoint-linux-check-file [ [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-linux-check-file
show running-config endpoint-linux-check-file [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

DELETE

```
delete endpoint-linux-check-file ([name] | all)
```

DESCRIPTION

Access Policy Manager checks for the presence of one or more files on a client that is attempting to connect. If a file with the described properties exists, the action goes to the successful branch. If the file does not exist, or a file exists but one or more properties are not correct, the action goes to the fallback branch.

You can use the endpoint-linux-check-file component to create or manage an Endpoint Linux Check File agent that verifies the presence of specified Linux files on a client.

EXAMPLES

```
create endpoint-linux-check-file Myprofile act file check ag { files {
  filename "/tmp/demo/demofile" md5 "6b61ad518c23650b17e738e1fa2bb04e"
  modified 2007-06-01 10:30:10 size 12 } { filename "/tmp/demo/testfile"
  md5 "f20d9f2072bbeb6691c0f9c5099b01f3" size 9 } }
Creates the Endpoint Linux Check File agent named
Myprofile act file check ag that checks that the client contains
two files located in the /tmp/demo directory: a 12 byte file named
demofile that was modified no later than January 6, 2007 at 10:30
and has an MD5 checksum of 6b61ad518c23650b17e738e1fa2bb04e, and a
```

9-byte file named testfile that has an MD5 check sum of f20d9f2072bbeb6691c0f9c5099b01f3.

list all endpoint-linux-check-file Company8profile_act_file_check_ag
Displays information about the Endpoint Linux Check File agent named Company8profile_act_file_check_ag.

```
delete endpoint-linux-check-file Company8profile_act_check_file { files
{ filename "/tmp/demo/demofile" }}
Deletes the /tmp/demo/demofile file from the Endpoint Linux Check
File agent named Company8profile_act_file_check_ag.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

files
Adds files to or deletes files from an Endpoint Linux Check File agent. You can specify the following attributes of the files that you want an Endpoint Linux Check File agent to verify the presence of on the client in order to allow the access policy to pass.

filename
Specifies the name of the file and includes the full path. The Endpoint Linux Check File agent that you are creating must be able to verify the file's presence on the client for the access policy to pass. When you add a file to or delete a file from the agent, this setting is required.

md5 Specifies the value of an MD5 checksum. The Endpoint Linux Check File agent you are creating must be able to match the checksum on the client for the access policy to pass. The default is none.

modified
Specifies the last modified date of the specified file. The Endpoint Linux Check File agent you are creating must verify this date on the client for the access policy to pass. The default is 1970-01-01 00:00:00.

size Specifies the size, in bytes, of the specified file. The Endpoint Linux Check File agent you are creating must verify this size on the client for the access policy to pass. The default is 0.

continuous-check
Continuously check the files, and end the session if the result changes. The default is false.

[name]
Specifies the name of an Endpoint Linux Check File agent. This setting is required.

partition
Displays the partition within which the component resides.

apm policy agent endpoint-linux-check-process

NAME
endpoint-linux-check-process - Manages an Endpoint Linux Check Process agent.

MODULE
apm policy agent

SYNTAX
Configure the endpoint-linux-check-process component within the policy

agent module using the following syntax.

CREATE/MODIFY

```
create endpoint-linux-check-process [name]
modify endpoint-linux-check-process [name]
options
  continuous-check [ true | false ]
  app-service [[string] | none]
  expression [ string | none ]
```

```
edit endpoint-linux-check-process [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list endpoint-linux-check-process
list endpoint-linux-check-process [ [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-linux-check-process
show running-config endpoint-linux-check-process [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

DELETE

```
delete endpoint-linux-check-process [name]
```

DESCRIPTION

You can use the endpoint-linux-check-process component to create and manage an Endpoint Linux Check Process agent that collects information about the Linux processes running on the client.

EXAMPLES

```
create endpoint-linux-check-process MyEndpointWCPagent { (bash OR top)
AND firefox }
Creates the Endpoint Linux Check Process agent named
MyEndpointWCPagent that checks that the client has either bash or
top, and firefox launched.
```

```
list endpoint-linux-check-process
Displays a list of Endpoint Linux Check Process agents.
```

```
delete endpoint-linux-check-process MyEndpointWCPagent
Deletes the Endpoint Linux Check Process agent named
MyEndpointWCPagent.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

expression
Specifies the expression that you want an Endpoint Linux Check Process agent to use to verify the processes that are running on the client to allow the access policy to pass. You can use the following operators: AND, OR, NOT, (and). You can use wildcards in the process name, for example, navapvc.*.

If the check is successful, the system returns 1. If the check fails, the system returns 0. If the expression is incorrect, the system returns -1.

continuous-check
Continuously check the expression, and end the session if the result changes. The default is false.

[name]
Specifies the name of an Endpoint Linux Check Process agent. This setting is required.

partition
Displays the partition within which the component resides.

all-properties
app-service
current-module
non-default-properties
one-line
partition

DELETE
delete endpoint-mac-check-file ([name] | all)

DESCRIPTION
Access Policy Manager checks for the presence of one or more files on a client that is attempting to connect. If a file with the described properties exists, the action goes to the successful branch. If the file does not exist, or a file exists but one or more properties are not correct, the action goes to the fallback branch.

You can use the endpoint-mac-check-file component to create or manage an Endpoint Macintosh Check File agent that verifies the presence of specified Macintosh files on a client.

EXAMPLES
create endpoint-mac-check-file Myprofile_act_file_check_ag { files { filename "/tmp/demo/demofile" md5 "6b61ad518c23650b17e738e1fa2bb04e" modified 2007-06-01 10:30:10 size 12 } { filename "/tmp/demo/testfile" md5 "f20d9f2072bbeb6691c0f9c5099b01f3" size 9 } }
Creates the Endpoint Macintosh Check File agent named Myprofile_act_file_check_ag that checks that the client contains two files located in the /tmp/demo directory: a 12 byte file named demofile that was modified no later than January 6, 2007 at 10:30 and has an MD5 checksum of 6b61ad518c23650b17e738e1fa2bb04e, and a 9 byte file named testfile that has an MD5 check sum of f20d9f2072bbeb6691c0f9c5099b01f3.

list all endpoint-mac-check-file Company8profile_act_file_check_ag
Displays information about the Endpoint Macintosh Check File agent named Company8profile_act_file_check_ag.

delete endpoint-mac-check-file Company8profile_act_check_file { files { filename "/tmp/demo/demofile" } }
Deletes the /tmp/demo/demofile file from the Endpoint Macintosh Check File agent named Company8profile_act_file_check_ag.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

files
Adds files to or deletes files from an Endpoint Macintosh Check File agent. You can specify the following attributes of the files that you want an Endpoint Macintosh Check File agent to verify the presence of on the client to allow the access policy to pass:

filename
Specifies the name of the file and includes the full path. The Endpoint Macintosh Check File agent that you are creating must be able to verify the file's presence on the client for the access policy to pass. When you add a file to or delete a file from the agent, this setting is required.

md5 Specifies the value of an MD5 checksum. The Endpoint Macintosh Check File agent you are creating must be able to match the checksum on the client for the access policy to pass. The default is none.

modified
Specifies the last modified date of the specified file. The Endpoint Macintosh Check File agent you are creating must verify this date on the client for the access policy to pass. The default is 1970-01-01 00:00:00.

size Specifies the size, in bytes, of the specified file. The Endpoint Macintosh Check File agent you are creating must verify this size on the client for the access policy to pass. The default is 0.

continuous-check
Continuously check the files, and end the session if the result changes. The default is false.

[name]
Specifies the name of an Endpoint Macintosh Check File agent. This setting is required.

partition
Displays the partition within which the component resides.

apm policy agent endpoint-mac-check-process

NAME

endpoint-mac-check-process - Manages an Endpoint Macintosh Check Process agent.

MODULE

apm policy agent

SYNTAX

Configure the endpoint-mac-check-process component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create endpoint-mac-check-process [name]
modify endpoint-mac-check-process [name]
options
  continuous-check [ true | false ]
  app-service [[string] | none]
  expression [ string | none ]
```

```
edit endpoint-mac-check-process [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list endpoint-mac-check-process
list endpoint-mac-check-process [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-mac-check-process
show running-config endpoint-mac-check-process [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  current-module
  non-default-properties
  one-line
  partition
```

DELETE

```
delete endpoint-mac-check-process ([name] | all)
```

DESCRIPTION

You can use the endpoint-mac-check-process component to create and manage an Endpoint Macintosh Check Process agent that collects information about the Macintosh processes running on the client.

EXAMPLES

```
create endpoint-mac-check-process MyEndpointWCPagent { (bash OR top)
AND firefox }
```

Creates the Endpoint Macintosh Check Process agent named MyEndpointWCPagent that checks that the client has either bash or top, and firefox launched.

```
list endpoint-mac-check-process
```

Displays a list of Endpoint Macintosh Check Process agents.

```
delete endpoint-mac-check-process MyEndpointWCPagent
```

Deletes the Endpoint Macintosh Check Process agent named MyEndpointWCPagent.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

expression

Specifies the expression that you want an Endpoint Macintosh Check Process agent to use to verify the processes that are running on the client in order to allow the access policy to pass. You can use the following operators: AND, OR, NOT, (and). You can use wildcards in the process name, for example, navapvc.*.

If the check is successful, the system returns 1. If the check fails, the system returns 0. If the expression is incorrect, the system returns -1.

continuous-check

Continuously check the expression, and end the session if the result changes. The default is false.

[name]

Specifies the name of an Endpoint Macintosh Check Process agent. This setting is required.

partition

Displays the partition within which the component resides.

DELETE

delete endpoint-windows-browser-cache-cleaner ([name] | all)

DESCRIPTION

Endpoint security is a centrally-managed method of monitoring and maintaining client-system security. You can use the endpoint-windows-browser-cache-cleaner component to create and manage an Endpoint Windows Browser Cache Cleaner agent. This agent cleans items from the client browser and computer after logoff, and also enforces session inactivity timeouts.

EXAMPLES

```
create endpoint-windows-browser-cache-cleaner MyEndpointWBCCagent idle  
timeout 0
```

Creates the Endpoint Windows Browser Cache Cleaner agent named MyEndpointWBCCagent that does not enforce a timeout.

```
create endpoint-windows-browser-cache-cleaner MyEndpointWBCCagent {  
idle timeout 0 clean passwords enable }
```

Creates the Endpoint Windows Browser Cache Cleaner agent named MyEndpointWBCCagent that does not enforce a timeout, but does clear saved passwords from the client after logoff.

```
list endpoint-windows-browser-cache-cleaner
```

Displays a list of Endpoint Windows Browser Cache Cleaner agents.

```
delete endpoint-windows-browser-cache-cleaner MyEndpointWBCCagent
```

Deletes the Endpoint Windows Browser Cache Cleaner agent named MyEndpointWBCCagent.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

cache-clean-type

Specifies which browser cache temporary files are removed. If set to all, the temporary files are removed. If set to all-except-css-js, the browser cache is cleared, but all style sheets and JavaScript are left on the browser cache. If set to all-except-img-css-js, the browser cache is cleared, but all style sheets, JavaScript, and images are left on the browser cache. The default is all.

clean-passwords

When true, the Endpoint Windows Browser Cache Cleaner agent ensures that saved passwords are cleared from the client after logoff. The default is false.

empty-recycle-bin

When true, the Endpoint Windows Browser Cache Cleaner agent empties the Recycle Bin on the client after logoff. The default is false.

idle-timeout

Specifies the number of minutes that the client session can be idle before the Endpoint Windows Browser Cache Cleaner agent disconnects the session. The default is 0, which enforces no timeout. This is a required setting.

idle-timeout-screen-lock

Specifies the number of minutes the system can receive no user input before the workstation is locked. The default is 0, which specifies no timeout enforced.

monitor-webtop

When true, the Endpoint Windows Browser Cache Cleaner agent forces session termination if the browser or webtop is closed. The default is false.

[name]

Specifies the name of the Endpoint Windows Browser Cache Cleaner agent. This is a required setting.

partition

Displays the partition within which the component resides.

remove-connection-entry

When true, the Endpoint Windows Browser Cache Cleaner agent removes the connection from the Network Connections Dial-up Networking folder on the client. The default is false.

SEE ALSO

DELETE
delete endpoint-windows-check-file ([name] | all)

DESCRIPTION
Access Policy Manager checks for the presence of one or more files on a client that is attempting to connect. If a file with the described properties exists, the action goes to the successful branch. If the file does not exist, or a file exists but one or more properties are not correct, the action goes to the fallback branch.

You can use the endpoint-windows-check-file component to create or manage an Endpoint Windows Check File agent that verifies the presence of specified Windows files on a client.

EXAMPLES
create endpoint-windows-check-file Myprofile act_file_check_ag { files { filename "C:\\demo\\demofile" md5 "6b61ad518c23650b17e738e1fa2bb04e" modified 2007-06-01 10:30:10 size 12 } { filename "C:\\demo\\test.file" md5 "f20d9f2072bbeb6691c0f9c5099b01f3" size 9 } }
Creates the Endpoint Windows Check File agent named Myprofile_act_file_check_ag that checks that the client contains two files located in the C:\\demo directory: a 12 byte file named demofile that was modified no later than January 6, 2007 at 10:30 and has an MD5 checksum of 6b61ad518c23650b17e738e1fa2bb04e, and a 9 byte file named test.file that has an MD5 check sum of f20d9f2072bbeb6691c0f9c5099b01f3.

list all endpoint-windows-check-file Company8profile act_file_check_ag
Displays information about the Endpoint Windows Check File agent named Company8profile_act_file_check_ag.

delete endpoint-windows-check-file Company8profile_act_check_file { files { filename "C:\\demo\\demofile" } }
Deletes the C:\\demo\\demofile file from the Endpoint Windows Check File agent named Company8profile_act_file_check_ag.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

files
Adds files to or deletes files from an Endpoint Windows Check File agent. You can specify the following attributes for the files that

you want an Endpoint Windows Check File agent to verify the presence of on the client to allow the access policy to pass.

filename

Specifies a file name and includes the full path. The Endpoint windows Check File agent you are creating must be able to verify the file's presence on the client for the access policy to pass. When you add a file to or delete a file from the agent, this setting is required.

md5 Specifies the value of an MD5 checksum. The Endpoint windows Check File agent that you are creating must match the checksum on the client for the access policy to pass. The default is none.

modified

Specifies the last modified date of the specified file. The Endpoint windows Check File agent you are creating must verify this date on the client for the access policy to pass. The default is 1970-01-01 00:00:00.

operation

Specifies the operator that you want your Endpoint Windows Check File agent to use when verifying the attributes of the specified file on the client. The default is equal.

signer

Specifies that the Endpoint Windows Check File agent must verify that the specified file on the client is signed for the access policy to pass. The default is none.

size Specifies the size, in bytes, of the specified file. The Endpoint Windows Check File agent you are creating must verify this file size on the client for the access policy to pass. The default is 0.

version

Specifies the version of the specified file that you want your Endpoint Windows Check File agent to verify on the client for the access policy to pass. Specify the version using the following form: x.x.x.x. The maximum value is 65535.65535.65535.65535. The default is none.

continuous-check

Continuously check the files, and end the session if the result changes. The default is false.

[name]

Specifies the name of an Endpoint Windows Check File agent. This option is required.

partition

Displays the partition within which the component resides.

```

DESCRIPTION

You can use the endpoint-windows-check-process component to create and manage an agent that collects information about the Windows processes running on the client.

EXAMPLES

```

create endpoint-windows-check-process MyEndpointWCPagent { (NISUM.exe
OR blackd.exe) AND navapvc.* }
Creates the Endpoint Windows Check Process agent named
MyEndpointWCPagent that checks that the client has either
NISUM.exe or blackd.exe, and navapvc.* installed.

```

```

list endpoint-windows-check-process
Displays a list of Endpoint Windows Check Process agents.

```

```

delete endpoint-windows-check-process MyEndpointWCPagent delete
Deletes the Endpoint Windows Check Process agent named
MyEndpointWCPagent.

```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

expression
Specifies the expression that you want an Endpoint Windows Check Process agent to use to verify the processes that are running on the client in order to allow the access policy to pass. You can use the following operators: AND, OR, NOT, (and). You can use wildcards in the process name, for example, navapvc.*.

If the check is successful, the system returns 1. If the check fails, the system returns 0. If the expression is incorrect, the system returns -1.

continuous-check
Continuously check the expression, and end the session if the result changes. The default is false.

[name]
Specifies the name of an Endpoint Windows Check Process agent. This setting is required.

partition
Displays the partition within which the component resides.

non-default-properties
```

DISPLAY

```
list endpoint-windows-check-registry
```

```
list endpoint-windows-check-registry [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config endpoint-windows-check-registry
```

```
show running-config endpoint-windows-check-registry [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
partition
```

```
show endpoint-windows-check-registry
```

```
show endpoint-windows-check-registry [name]
```

DELETE

```
delete endpoint-windows-check-registry [name]
```

DESCRIPTION

You can use the endpoint-windows-check-registry component to create and manage an agent that collects information about the Windows registry keys on the client that is attempting to connect.

EXAMPLES

```
create endpoint-windows-check-registry MyEndpointWCRagent
{"\"HKEY_LOCAL_MACHINE\\SOFTWARE\\Microsoft\\Internet
Explorer\".\"Version\"=\"5.0.2800.0\""}
}
```

Creates the Endpoint Windows Check Registry agent named MyEndpointWCRagent that checks the registry on the client for version 5.0.2800.0 of Internet Explorer in the HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft directory.

```
create endpoint-windows-check-registry MyEndpointWCRagent
{"\"HKEY_LOCAL_MACHINE64\\SOFTWARE\\Microsoft\\Internet
Explorer\".\"Version\"=\"5.0.2800.0\""}
}
```

Creates the Endpoint Windows Check Registry agent named MyEndpointWCRagent that checks the registry on the client for version 5.0.2800.0 of Internet Explorer in the HKEY_LOCAL_MACHINE64\SOFTWARE\Microsoft directory.

Note that the registry value HKEY_LOCAL_MACHINE64 is one of the 32 and 64-bit registry keys that you can specify on 64-bit Windows versions. On 64-bit Windows systems, you can check for registry keys in either the 64-bit registry or the 32-bit registry. To specify the registry to check, append a number to the registry root key name. The following key names are supported:

```
HKEY_CURRENT_USER
HKEY_CURRENT_USER32
HKEY_CURRENT_USER64
HKEY_LOCAL_MACHINE
HKEY_LOCAL_MACHINE32
HKEY_LOCAL_MACHINE64
HKEY_CLASSES_ROOT
HKEY_CLASSES_ROOT32
HKEY_CLASSES_ROOT64
HKEY_USERS
HKEY_USERS32
```

HKEY_USERS64 HKEY values specified with a 32 allow you to check values in the 32-bit view of 64-bit registry. This is the perspective used by 32-bit applications running with on a 64-bit operating system.

HKEY values with a 64 appended allow you to check values in the 64-bit view of the registry. This is the perspective used by native 64-bit applications. When checking values on 32-bit Windows, the number of bits specified in the registry key name is ignored.

```
list endpoint-windows-check-registry
```

Displays a list of Endpoint Windows Check Registry agents.

```
delete endpoint-windows-check-registry MyEndpointWCRagent delete
Deletes the Endpoint Windows Check Registry agent named MyEndpointWCRagent.
```

OPTIONS

```
app-service
```

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

expression

Specifies the expression that you want an Endpoint Windows Check Registry agent to use to verify the registry entries that are present on the client in order to allow the access policy to pass. You can use the following operators: AND, OR, NOT, (and).

If the check is successful, the system returns 1. If the check fails, the system returns 0. If the expression is incorrect, the system returns -1.

Important: You must use quotation marks (" ") around key and value arguments, and in data when the content contains spaces, commas, slashes, tabs, or other delimiters. If quotation marks exist as part of a registry path or value name, you must use quotation marks around those quotation marks.

Tip: The system treats data in the formats "d.d[d].d" or "d,d[,d][,d]" (where d is a number) as a version number. The system treats data in the format "mm/dd/yyyy" as a date.

continuous-check

Continuously check the expression, and end the session if the result changes. The default is false.

[name]

Specifies the name of the an Endpoint Windows Check Registry agent. This option is required.

partition

Displays the partition within which the component resides.

apm policy agent endpoint-windows-group-policy

NAME

endpoint-windows-group-policy - Manages an Endpoint Windows Group Policy agent.

MODULE

apm policy agent

SYNTAX

Warning: This page is obsolete. Windows Group Policy is no longer supported.

Configure the external-logon-page component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create endpoint-windows-group-policy [name]
modify endpoint-windows-group-policy [name]
options:
  app-service [[string] | none]
  policy-file { [name] }
```

```
edit endpoint-windows-group-policy [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list endpoint-windows-group-policy
list endpoint-windows-group-policy [ [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-windows-group-policy
show running-config endpoint-windows-group-policy [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

non-default-properties
partition

show endpoint-windows-group-policy
show endpoint-windows-group-policy [name]

DELETE
delete endpoint-windows-group-policy [name]

DESCRIPTION
Endpoint Windows Group Policy agents enable you to apply an Endpoint Windows Group Policy to a client machine and create a result session variable.

EXAMPLES
create endpoint-windows-group-policy { Firewall_Settings_Template }
Creates a policy for the Access Policy using the Firewall Settings template.

edit endpoint-windows-group-policy Firewall_Settings_Template
Edits the Firewall Settings Template.

OPTIONS
[name]
Specifies a name for the Endpoint Windows Group Policy agent.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

policy-file
Specifies the group policy template that is applied to the client. This option is required.

SEE ALSO

options:
 all-properties

```

non-default-properties
partition

show endpoint-windows-info-os
show endpoint-windows-info-os [name]

DELETE
delete endpoint-windows-info-os [name]

DESCRIPTION
You can use the endpoint-windows-info-os component to create and manage
an agent that retrieves information about the Microsoft Windows
operating system from the client, such as version and hotfix number.

EXAMPLES
create endpoint-windows-info-os MyEndpointWIOSagent { }
Creates the Endpoint Windows Operating System Information agent
named MyEndpointWIOSagent.

list endpoint-windows-info-os
Displays a list of Endpoint Windows Operating System Information
agents.

delete endpoint-windows-info-os MyEndpointWIOSagent delete
Deletes the Endpoint Windows Operating System Information agent
named MyEndpointWCRagent.

OPTIONS
[name]
Specifies the name of an Endpoint Windows Info OS agent. This
setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

NAME
endpoint-windows-protected-workspace - Manages an Endpoint Windows
Protected Workspace agent.

MODULE
apm policy agent

SYNTAX
Configure the endpoint-windows-protected-workspace component within the
policy agent module using the following syntax.

CREATE/MODIFY
create endpoint-windows-protected-workspace [name]
modify endpoint-windows-protected-workspace [name]
options:
  allow-burn-cid [true | false]
  allow-printer-use [true | false]
  allow-user-switch [true | false]
  allowed-network-shares [add | delete | modify | replace-all-with] {
    [[string]]
  }
  app-service [[string] | none]
  close-google-desktop-search [true | false]
  usb-flash-access [all | ironkey | none]

edit endpoint-windows-protected-workspace [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties

```

non-default-properties

DISPLAY

```
list endpoint-windows-protected-workspace
list endpoint-windows-protected-workspace [ [ [name] | [glob] | [regex] ] ... ]
show running-config endpoint-windows-protected-workspace
show running-config endpoint-windows-protected-workspace [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

show endpoint-windows-protected-workspace
show endpoint-windows-protected-workspace [name]
```

DELETE

```
delete endpoint-windows-protected-workspace [name]
```

DESCRIPTION

You can use the endpoint-windows-protected-workspace component to create and manage an agent that enables an administrator to impose limitations on applications running on Windows client machines.

OPTIONS

```
allow-burn-cid
Specifies that the user can burn CDs from within protected
workspace. The default is false.

allow-printer-use
Specifies whether a user can print inside a protected workspace.
The default is true.

allow-user-switch
Specifies whether a user can temporarily switch from a protected
workspace. The default is true.

allowed-network-shares
Specifies a list of Windows network shares to which user has Write
access. The default is none.

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

[name]
Specifies the name of the Endpoint Windows Protected Workspace
agent. This option is required.

partition
Displays the partition within which the component resides.

usb-flash-access
Specifies whether a user has access to a USB port. The default is
false.
```

BIG-IP apm policy agent-endpoint-windows-protected-workspace(1)

apm policy agent external-logon-page

NAME

external-logon-page - Manages an External Logon Page agent.

MODULE

apm policy agent

SYNTAX

Configure the external-logon-page component within the policy agent module using the following syntax.

CREATE/MODIFY

```
create external-logon-page [name]
modify external-logon-page [name]
```

```

options:
  app-service [[string] | none]
  split-username {true | false}
  uri [[string]> | none]

edit external-logon-page [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

  DISPLAY
list external-logon-page
list external-logon-page [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    partition

DELETE
delete external-logon-page [name]

DESCRIPTION
  The External Logon Page agent creates an external Logon page that
  redirects the client browser.

EXAMPLES
  create external-logon-page MyExternalLogonPageAgent { uri
  "MyExternalLogonPageServerURI" }
  Creates the External Logon Page agent named
  MyExternalLogonPageAgent that is associated with the URI
  MyExternalLogonPageServerURI.

  create external-logon-page MyExternalLogonPageAgent { uri
  "%{session.my_server_uri}" }
  Creates the External Logon Page agent named
  MyExternalLogonPageAgent with a URI of session.my_server_uri.

  list external-logon-page
  Displays a list of External Logon Page agents.

  delete external-logon-page MyExternalLogonPageAgent
  Deletes the External Logon Page agent named
  MyExternalLogonPageAgent.

OPTIONS
  [name]
  Specifies the name of an External Logon Page agent. This option is
  required.

  partition
  Displays the partition within which the component resides.

  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  split-username
  Specifies whether user's input is split into username and domain.
  This option supports UPN style logon ID (userid@domainid) and
  Windows Domain User account ID (domainid\userid). The default is
  false. Set this to true when you want to store the username and
  domain separately.

  uri
  Specifies a predefined configuration that contains several
  settings that you want the agent to use to configure an External
  Logon page. This option is required.

SEE ALSO
  logon-page

COPYRIGHT

apm policy agent http-header-modify

NAME
 http-header-modify - HTTP header and cookie manipulation agent for
 per-request access policy.

MODULE

apm policy agent

SYNTAX

Manipulate HTTP headers or cookies within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY

```
create http-header-modify [name]
modify http-header-modify [name]
options:
  app-service [[string] | none]
  cookie-entries [add | delete | modify | none | replace-all-with] {
    [name] {
      options:
        app-service [[string] | none]
        cookie-name [string]
        cookie-operation [cookie-delete | cookie-update]
        cookie-value [string]
      }
    }
  header-entries [add | delete | modify | none | replace-all-with] {
    [name] {
      options:
        app-service [[string] | none]
        header-delimiter [string]
        header-name [string]
        header-operation [header-append | header-insert | header-remove | header-replace]
        header-value [string]
      }
    }
  }
edit http-header-modify [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list http-header-modify
list http-header-modify [ [ [name] | [glob] | [regex] ] ... ]
show running-config http-header-modify
show running-config http-header-modify [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  cookie-entries
  header-entries
  non-default-properties
  partition
```

DELETE

```
delete http-header-modify [name]
```

DESCRIPTION

You can use the http-header-modify component to create and manage a http-header-modify agent that manipulates the HTTP and Cookie headers. Operations supported for HTTP header include insert, append, replace and remove while for cookie only update and delete operations are available. Please note that this agent applies only to per-request access policy.

EXAMPLES

```
create http-header-modify MyProfile_act_http-header-modify_ag {
  cookie-entries {
    0 {
      cookie-name PHPSESSID
      cookie-value 1234
    }
    1 {
      cookie-name mySession
      cookie-operation cookie-delete
      cookie-value 5678
    }
  }
  header-entries {
    0 {
      header-name Cache-Control
      header-value no-cache
    }
    1 {
      header-delimiter ;
      header-name User-Agent
      header-operation header-append
      header-value "Mozilla/5.0"
    }
    2 {
      header-name Pragma
      header-operation header-replace
      header-value no-store
    }
    3 {
      header-name Pragma
      header-operation header-remove
      header-value no-cache
    }
  }
}
```

In above example, http-header-modify agent named MyProfile_act_http-header-modify_ag in partition Common and adds 2 cookie and 4 HTTP header entries. cookie entry 0 updates cookie value PHPSESSID to '1234' while entry 1 deletes when cookie value 'mySession=5678'. Header entries refer to various header operations. Entry 0 inserts header 'Cache-Control: 5678'. Entry 1 updates value of header User-Agent to include ';Mozilla/5.0'. Entry 2 replaces value of

header Pragma by 'no-store'. Finally, 3 entry will remove header-value matching 'Pragma: no-cache' from HTTP headers.

list http-header-modify

Displays a list of http-header-modify agents.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

name Specifies the name of HTTP header modify agent. This setting is required.

cookie-entries

Specifies a list of entries specifying cookie header manipulations.

cookie-name

Specifies cookie name to match. This setting is required for cookie-entries.

cookie-operation

Specifies operation on the cookie name specified in cookie-name. Possible values include cookie-update and cookie-delete.

cookie-update

Update the cookie value in the cookie-name, cookie-value pair. This is the default cookie-operation.

cookie-delete

Delete the cookie that matches the cookie-name, cookie-value pair.

cookie-value

Specifies cookie value to be operated on. This is required for cookie-entries.

header-entries

Specifies a list of entries specifying HTTP header manipulations.

header-delimiter

Specifies delimiter character to use when header-operation is header-append.

header-name

Specifies HTTP header to match to be operated on. This setting is required for header-entries.

header-operation

Specifies operation on the HTTP header specified in header-name. Options include the following:

header-append

Append header-value to the value of HTTP header header-name delimited by header-delimiter.

header-insert

Insert HTTP header containing header-name, header-value pair. This is the default header-operation.

header-remove

Remove the HTTP header, value pair that matches the header-name, header-value pair.

header-replace

Replace value of HTTP header matching header-name by value header-value.

header-value

Specifies HTTP header value to be operated on. This is required for header-entries.

partition

Displays the partition within which the component resides.

apm policy agent ip-geolocation-lookup

NAME
ip-geolocation-lookup - Manages an IP Geolocation Lookup agent.

MODULE
apm policy agent

SYNTAX
Configure the ip-geolocation-lookup component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create ip-geolocation-lookup [name]
modify ip-geolocation_lookup [name]
options:
app-service [[string] | none]

edit ip_geolocation_lookup [[name] | [glob] | [regex] ...]
options:
all-properties
non-default-properties

DISPLAY
list ip_geolocation_lookup
list ip_geolocation_lookup [[name] | [glob] | [regex] ...]
options:
all-properties
non-default-properties
partition

DELETE
delete ip_geolocation_lookup [name]

DESCRIPTION
You can use the ip_geolocation_lookup component to create and manage an IP Geolocation Lookup agent.

EXAMPLES
create ip_geolocation_lookup example_ip_geolocation_lookup_ag
Creates the example_ip_geolocation_lookup_ag IP Geolocation Lookup agent that searches for the IP Geolocation of the chosen IP address.

delete ip_geolocation_lookup example_ip_geolocation_lookup_ag delete
Deletes the IP Geolocation Lookup agent named example_ip_geolocation_lookup_ag.

OPTIONS
[name]
Specifies the name of a IP Geolocation Lookup agent. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

BIG-IP 201apm4policy agent ip-geolocation-lookup(1)

apm policy agent ip-reputation-lookup

NAME
ip-reputation-lookup - Manages an IP Reputation Lookup agent.

MODULE
apm policy agent

SYNTAX
Configure the ip-reputation-lookup component within the policy agent module using the syntax shown in the following sections.

```
CREATE/MODIFY
create ip-reputation-lookup [name]
modify ip-reputation_lookup [name]
options:
  app-service [[string] | none]

edit ip_reputation_lookup [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list ip_reputation_lookup
list ip_reputation_lookup [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

DELETE
delete ip_reputation_lookup [name]

DESCRIPTION
You can use the ip_reputation_lookup component to create and manage an
IP Reputation Lookup agent.
```

EXAMPLES

```
create ip_reputation_lookup example_ip_reputation_lookup_ag
Creates the example_ip_reputation_lookup_ag IP Reputation Lookup
agent that searches for the IP Reputation of the chosen IP
address.

delete ip_reputation_lookup example_ip_reputation_lookup_ag delete
Deletes the IP Reputation Lookup agent named
example_ip_reputation_lookup_ag.
```

OPTIONS

```
[name]
Specifies the name of a IP Reputation Lookup agent. This setting
is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.
```

BIG-IP 2018apm-policy agent ip-reputation-lookup(1)

apm policy agent irule-event

NAME

irule-event - Manages an iRule Event agent.

MODULE

apm policy agent

SYNTAX

Configure the irule-event component within the policy agent module using the syntax shown in the following sections.

```
CREATE/MODIFY
create irule-event [name]
modify irule-event [name]
options:
  app-service [[string] | none]
  id [[string] | none]
  expect-data [[client-accepted] | [ssl-client-hello] | [ssl-cert-available] | [http] | [none]]

edit irule-event [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list irule-event
list irule-event [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config irule-event
show running-config irule-event [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

show irule-event
show irule-event [name]

DELETE
delete irule-event [name]
```

DESCRIPTION

You can use the `irule-event` component to add a custom Access iRule event to an access policy. This agent enables you to combine access policy execution with iRule execution.

For example, you can retrieve the current agent ID (using an iRule command `ACCESS::policy agent_id`) to determine which of the iRule agents raised the event and then perform some custom logic execution.

The Per-Request Policy's Access iRule event functions similarly to the Access iRule event in the main access policy, but retrieval of the current agent ID uses the iRule command `"ACCESS::perflow get perflow.irule_agent_id"` to determine which of the iRule agents raised the event.

The `expect-data` component is used in the Per-Request Policy when adding an Access iRule event. You must specify the last piece of data that the policy should wait for before raising the event. The default is HTTP.

EXAMPLES

```
when ACCESS_POLICY_AGENT_EVENT { if {[ACCESS::policy agent_id] eq
"lastLogon"} { # Our limit in seconds set 2weeks 1209600 # diff in 100
nanosecond increments between MS time attribute (year 1601) and start
of epoch set offset 11644473600000 set adtime "[ACCESS::session data
get session.ad.last.attr.lastLogon]" # convert adtime to milliseconds
set millisecs [expr {$adtime / 10000}] # subtract offset set
lastlogintime [expr {$millisecs - $offset}] # convert to seconds
because milliseconds for 'now' were negative (maybe vmware issue) set
secs [expr {$lastlogintime / 1000}] set now [clock seconds] # finally
calculate the difference set diff [expr {$now - $secs}] log local0.
"lastLogon: $diff seconds from current time" if { $diff $2weeks } {
ACCESS::session data set session.custom.lastLogonWithin2Weeks 0 } else
{ ACCESS::session data set session.custom.lastLogonWithin2Weeks 1 } } }
```

In this example, `ACCESS_POLICY_AGENT_EVENT` gathers data containing the users whose last logon was within the last two weeks. Note that you can access session variables and create new session variables inside this event.

```
list irule-event all
Displays a list of OAM agents.
```

```
delete irule-event my_irule_agent
Deletes the iRule Event agent named my_irule_agent.
```

OPTIONS

`app-service`
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`id` Specifies the ID of the iRule event. The default is none. You can use the ID to determine which agent caused the `ACCESS_POLICY_AGENT_EVENT`. You can also use the ID to perform different processing inside iRule for different agents.

`[name]`
Specifies the name of the component. This option is required.

`partition`
Displays the partition within which the component resides.

NAME
kerberos - Manages a Kerberos agent.

MODULE
apm policy agent

SYNTAX
Configure the kerberos component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create kerberos [name]
modify kerberos [name]
options:
app-service [[string] | none]
max-logon-attempt [integer]
server [string]

edit kerberos [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list kerberos
list kerberos [[[name] | [glob] | [regex]] ...]
show running-config kerberos
show running-config kerberos [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

show kerberos
show kerberos [name]

DELETE
delete kerberos [name]

DESCRIPTION
You can use the kerberos component to create and manage a Kerberos agent.

EXAMPLES
create kerberos my_kerberos_agent
Creates a Kerberos agent named my_kerberos_agent.

list kerberos all
Displays a list of Kerberos agents.

delete kerberos my_kerberos_agent
Deletes the Kerberos agent named my_kerberos_agent.

OPTIONS
[name]
Specifies the name of the component. This option is required.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

partition
Displays the partition within which the component resides.

server
Specifies the name of the Kerberos server. This option is required.

apm policy agent l7-protocol-lookup

NAME
l7-protocol-lookup - Manages a L7 Protocol Lookup agent.

MODULE
apm policy agent

SYNTAX
Configure the l7-protocol-lookup component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create l7-protocol-lookup [name]
modify l7_protocol_lookup [name]
options:
app-service [[string] | none]

edit l7_protocol_lookup [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list l7_protocol_lookup
list l7_protocol_lookup [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

DELETE
delete l7_protocol_lookup [name]

DESCRIPTION
You can use the l7_protocol_lookup component to create and manage a L7 Protocol Lookup agent.

EXAMPLES
create l7_protocol_lookup example_l7_protocol_lookup_ag
Creates the example_l7_protocol_lookup_ag L7 Protocol Lookup agent that identifies the layer 7 protocol.

delete l7_protocol_lookup example_l7_protocol_lookup_ag delete
Deletes the L7 Protocol Lookup agent named example_l7_protocol_lookup_ag.

OPTIONS
[name]
Specifies the name of a L7 Protocol Lookup agent. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

BIG-IP 2018-0apmlpolicy agent l7-protocol-lookup(1)

apm policy agent logging

NAME
logging - Manages a Logging agent.

MODULE

apm policy agent

SYNTAX

Configure the logging component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY

```
create logging [name]
modify logging [name]
```

options:

```
app-service [[string] | none]
log-message [[string] | none]
variables [[string] | none]
```

```
edit logging [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list logging
```

```
list logging [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config logging
```

```
show running-config logging [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
app-service
log-message
non-default-properties
partition
variables
```

DELETE

```
delete logging [name]
```

DESCRIPTION

You can use the logging component to create and manage a logging agent that monitors the value of session variables and identifies the path taken by access policy execution. A logging agent can also be used to create and monitor custom or predefined session variables. Note that a session variable may or may not exist depending on the result of the access policy execution.

EXAMPLES

```
create logging MyProfile_act_logging_ag {
  variables
  {
    {session-var "session.logon.*"}
    {session-var "session.windows_check_file.Company8profile_act_file_check_ag.item_x.filename"}
  }
}
```

Creates the logging agent named MyProfile_act_logging_ag in partition Common and adds two session variables that define actions that the agent logs: session.logon.* indicates to log application logon attempts and session.windows_check_file.Company8profile_act_file_check_ag.item_x.filename indicates to log the outcome of the file check on the client. The x in item_x indicates the order of the files in the list configured for the file checker. The list starts with index 0 (zero).

```
create logging MyProfile_act_logging_ag {
  log-message "Logon Name: %{session.logon.last.username}."
}
```

Above example applies only to logging agent tied to per-request access policy. Here logging agent named MyProfile_act_logging_ag in partition Common will print log messages containing logon name. This removes the requirement to configure variables separately for per-request access policy.

```
list logging
```

Displays a list of logging agents.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

log-message

Specifies the log message to display. This option is required. For per-request access policy only, this option can contain session or per-request variables. However, session variables containing wildcard (*) are not supported.

name Specifies the name of a logging agent. This option is required.

partition

Displays the partition within which the component resides.

variables

Adds a variable to or deletes a variable from a logging agent. You use the sessionvar option to specify a session variable that indicates which actions the system logs. This option does not apply to per-request access policy agent.

BIG-IP 2016-03-14 apm policy agent logging(1)

apm policy agent logon-page

NAME
logon-page - Manages a Logon Page agent.

MODULE
apm policy agent

SYNTAX
Configure the logon-page component within the policy agent module using the following syntax.

CREATE/MODIFY
create logon-page [name]
modify logon-page [name]
options:
app-service [[string] | none]
basic-auth-realm [[string] | none]
customization-group [[string] | none]
field-modifiable1 [true | false]
field-modifiable2 [true | false]
field-modifiable3 [true | false]
field-modifiable4 [true | false]
field-modifiable5 [true | false]
field-type1 [checkbox | none | password | text]
field-type2 [checkbox | none | password | text]
field-type3 [checkbox | none | password | text]
field-type4 [checkbox | none | password | text]
field-type5 [checkbox | none | password | text]
http-401-auth-level [basic | basic-negotiate | negotiate | none]

session-var-name2 [[integer] | none]
session-var-name3 [[integer] | none]
session-var-name4 [[integer] | none]
session-var-name5 [[integer] | none]
clean-sess-var1 [true | false]
clean-sess-var2 [true | false]
clean-sess-var3 [true | false]
clean-sess-var4 [true | false]
clean-sess-var5 [true | false]
split-username [true | false]
type [401 | form-based]

edit logon-page [[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list logon-page
list logon-page [[name] | [glob] | [regex]] ...]
show running-config logon-page
show running-config logon-page [[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

show logon-page
show logon-page [name]

DELETE
delete logon-page [name]

DESCRIPTION
You can use the logon-page component to create and manage a Logon Page agent. This agent creates a logon page that includes the form in which users input the credentials required by an access policy. You can use the customization-group option to customize the logon page.

EXAMPLES
create logon-page MyLogonPageAgent my { type 401 basic-auth-realm myrealm split-username false http-401-auth-level none }
Creates a basic authentication Logon Page agent named MyLogonPageAgent that results in a 401 response.

list logon-page
Displays a list of Logon Page agents.

delete logon-page MyLogonPageAgent
Deletes the Logon Page agent named MyLogonPageAgent.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

basic-auth-realm

Specifies the system being accessed for HTTP basic authentication. This value is shown in the 401 response. Use this option only for basic authentication Logon pages.

clean-sess-var1 - clean-sess-var5

Specifies whether session variable under corresponding sess-var-name would be cleaned before logon page appearance (i.e. agent execution) or not. Works only with form-based authentication.

customization-group

Specifies a predefined configuration that contains several settings that you want the agent to use to configure a logon page. This setting is required, and the customization group that you assign must be of the type logon. Use this option only for basic authentication Logon pages.

field-modifiable1 - field-modifiable5

Specifies whether the user can modify the contents of the field on a form-based Logon page. The default is true. You can use this option to display read-only information. A Logon page contains can have a maximum of five fields. Use this option only for form-based Logon pages.

field-type1 - field-type5

Specifies the type of fields on a form-based Logon page. The default is text. Use this option only for form-based Logon pages. The options are:

checkbox
none
password
text

http-401-auth-level

Use this option only for basic authentication Logon pages. The options are:

basic
basic-negotiate
negotiate
none

[name]

Specifies the name of a Logon Page agent. This setting is required.

partition

Displays the partition within which the component resides.

post-var-name1 - post-var-name5

Specifies the name of the variable that is sent with POST request. Use this option only for form-based Logon pages.

sess-var-name1 - sess-var-name5

Specifies the session variable from which the initial value is taken. Use this option only for form-based Logon pages.

split-username

Specifies whether the user's input is split into username and domain. This option supports UPN style logon ID (userid@domainid) and Windows Domain User account ID (domainid\userid). The default is false. Set this to true when you want to store the username and domain separately.

Use this option only for basic authentication Logon pages.

type Specifies the type of logon page that appears. The options are:

401 Displays a basic HTTP authentication form.

form-based

Displays a logon page.

SEE ALSO

external-logon-page

apm policy agent message-box

NAME
message-box - Manages a Message Box agent.

MODULE
apm policy agent

SYNTAX
Configure the message-box component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create message-box [name]
modify message-box [name]
options:
 app-service [[string] | none]
 customization-group [string]

edit message-box [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list message-box
list message-box [[[name] | [glob] | [regex]] ...]
show running-config message-box
show running-config message-box [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 partition

show message-box
show message-box [name]

DELETE
delete message-box [name]

DESCRIPTION
You can use the message-box agent to create, display, or delete a Message Box agent. You cannot use the command line interface to create or modify the messages that display in a message box. You can also edit customizable messages using the visual policy editor.

EXAMPLES
create message-box MyMessageBoxAgent { customization group "MyMessageBoxCG" }
Creates the Message Box agent named MyMessageBoxAgent that is associated with the customization group named MyMessageBoxCG.

list message-box
Displays a list of Message Box agents.

delete message-box MyMessageBoxAgent
Deletes the Message Box agent named MyMessage BoxAgent.

OPTIONS
[name]
Specifies the name of a Message Box agent. This option is required.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the name of the customization group that contains the messages you want to apply to an access policy. This option is required.

partition
Displays the partition within which the component resides.

SEE ALSO

COPYRIGHT

apm policy agent oam

NAME
oam - Manages an OAM agent.

MODULE
apm policy agent

SYNTAX
Warning: This page is obsolete. AAA OAM agent is no longer supported.

Configure the oam component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create oam [name]
modify oam [name]
options:
app-service [[string] | none]
max-logon-attempt [integer]
server [[string] | none]
show-extended-error [true | false]
url [[string] | none]

edit oam [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list oam
list oam [[[name] | [glob] | [regex]] ...]
show running-config oam
show running-config oam [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

show oam
show oam [name]

DELETE
delete oam [name]

DESCRIPTION
You can use the oam component to create and manage an OAM agent.

EXAMPLES
create oam oam_agent1 { server oam10g max-logon-attempt 3 show-extended-error false url "http://www.mydomain.com/protected/" }
Creates an OAM agent named oam_agent1 that uses authentication server oam10g and prompts a user for credentials three times before denying access to http://www.mydomain.com/protected/.

modify oam oam_agent1 max-logon-attempt 4
list oam all
Displays a list of OAM agents.

delete oam my_oam_agent
Deletes the OAM agent named my_tacacsplus_agent.

OPTIONS
[name]
Specifies the name of the component. This option is required.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

max-logon-attempt
Specifies the maximum number of opportunities that users have to re-enter credentials after their first attempt to log in fails. If you set this value to a number from 2 to 5 inclusive, the system allows users the specified number of opportunities to log in after the first attempt to log in fails. If you set the value to 1, the system does not allow a second log in opportunity after a first log in attempt fails. The default value is 3.

partition
Displays the partition within which the component resides.

server
Specifies the name of the OAM server used for user authentication. This option is required.

url
Specifies the URL of the resource that is protected by the OAM server. It is used to authenticate the user using the specified user credentials. This option is required, and you must specify an absolute URL. An absolute URL specifies the exact location of a file or directory on the Internet.

show-extended-error
Specifies to display a verbose error message on the retry logon page. The default value is false.

non-default-properties
one-line
partition
prompt-for-authorization
recursive

DELETE

delete oauth-authz [name]

DESCRIPTION

You can use the oauth-authz component to create and manage an OAuth Authorization agent that provides OAuth Authorization server functionality, and also manage scopes and claims to provide different level of access control based on end user's role or any other criteria. For JWT type tokens, you can use the agent to manage audience and subject values.

EXAMPLES

```
create oauth-authz MyOAuthAuthzAgent {
  audience add { "company-oauth-rs.com" "partner-oauth-rs.com" }
  customization-group "company_authz"
  entries add {
    0 {
      expression "expr {return true}"
      id-token-claim-entries add {
        0 {
          claim-name "group"

        }
      }
      scope-entries add {
        0 {
          scope-name "project"
          scope-value "project-one"
        }
      }
    }
  }
}
subject "%{session.assigned.uuid}"
}
```

Creates an OAuth Authorization agent named MyOAuthAuthzAgent that uses customization group company_authz to customize the OAuth Authorization page.

The agent associates these scopes name, email, and domain and their values to each access token because the first expression always evaluates to true. If an id token is issued, it contains claim group. If the token type issued is JWT, each access token also includes claims group and profile and the UserInfo response will contain claim profile. The agent also associates scope project with value project-one to the token if the user is testuser. If JWT access token is issued to user testuser, it will contain claim service with value medium.

The agent additionally includes audience containing values company-oauth-rs.com and partner-oauth-rs.com along with subject and its value if the token issued is a JWT access token.

```
list oauth-authz
```

Displays a list of OAuth Authorization agents.

```
delete oauth-authz MyOAuthAuthzAgent
```

Deletes the OAuth Authorization agent named MyOAuthAuthzAgent.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

audience

Specifies a list of audience values used in JWT tokens issued. If audience list is specified in the OAuth Authorization agent, it overwrites the values in OAuth profile and OAuth client app.

customization-group

Specifies the customization group that defines the appearance of the OAuth Authorization page.

entries

Specifies a list of entries consisting of an expression and a list of scope entries. If the expression evaluates to true, then the OAuth Authorization agent associates the corresponding list of scope entries to an issued token. Scope entries determine the access control that the OAuth Authorization server requests on behalf of the client application.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

expression

Specifies the expression that you want an OAuth Authorization agent to use to verify in order to associate the corresponding scopes to an issued token. You can use the following operators: AND, OR, NOT, (and).

id-token-claim-entries

Specifies a list of entries consisting of an ID token claim name and its value.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

claim-name

Specifies the name of the claim.

claim-value

Specifies a value to the corresponding claim. This value can be any string or session variable.

jwt-access-token-claim-entries

Specifies a list of entries consisting of a JWT access-token claim name and its value.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

claim-name

Specifies the name of the claim.

claim-value

Specifies a value to the corresponding claim. This value can be any string or session variable.

scope-entries

Specifies a list of entries consisting of a scope name and its value.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

scope-name

Specifies the name of the scope.

scope-value

Specifies a value to the corresponding scope. This value can be any string or session variable.

userinfo-claim-entries

Specifies a list of entries consisting of a UserInfo claim name and its value.

app-service

Specifies the name of the application service to which

the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

claim-name
Specifies the name of the claim.

claim-value
Specifies a value to the corresponding claim. This value can be any string or session variable.

[name]
Specifies the name of the OAuth Authorization agent. This setting is required.

partition
Displays the partition within which the component resides.

prompt-for-authorization
Specifies whether the OAuth Authorization page, for user authorization, is displayed. This is applicable only for "Authorization code" and "Implicit" grants.

subject
Specifies the value of subject in JWT tokens issued. If subject is specified in the OAuth Authorization agent, it overwrites the the value specified in the OAuth profile.

apm policy agent resource-assign

NAME
resource-assign - Manages a Resource Assign agent.

MODULE
apm policy agent

SYNTAX
Configure the resource-assign component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY
create resource-assign [name]
modify resource-assign [name]
options:
app-service [[string] | none]
rules (| none)
type [acls | general | resources | webtop-and-webtop-links]

edit resource-assign [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list resource-assign
list resource-assign [[[name] | [glob] | [regex]] ...]
show running-config resource-assign
show running-config resource-assign [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

show resource-assign
show resource-assign [name]

DELETE
delete resource-assign [name]

DESCRIPTION
You can use the resource-assign component to create and manage an agent that assigns an ACL, a resource group, or both to an access policy. A resource group is a collection of resources, access control lists, and protection criteria, which includes your company intranet servers, applications, and network shares. An ACL is a set of restrictions

associated with a resource or favorite that defines access for users and groups.

EXAMPLES

```
create resource-assign MyAssignResourceAgent my rules { { expression
"expr { [mcget {session.ad.last.authresult}] == 1 }" webtop-links add {
google } } }
```

Creates the Resource Assign agent named MyAssignResourceAgent and assigns webtop-link google when authentication is passed.

```
list resource-assign all
```

Displays a list of Resource Assign agents.

```
delete resource-assign MyAssignResourceAgent
```

Deletes the Resource Assign agent named MyAssignResourceAgent.

OPTIONS

[name]

Specifies the name of the Resource Assign agent. This option is required.

partition

Displays the partition within which the component resides.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

rules

Adds a rule to or deletes a rule from the Resource Assign agent. You can use the following attributes to define a rule:

acl Specifies an access control list that this rule assigns to users.

connectivity-resource-group

Specifies the name of the connectivity resource group to which this rule applies.

expression

Specifies the expression that indicates which resource groups this rule assigns to users.

type Specifies the type of Resource Assign agent. The default is general.

SEE ALSO

apm policy agent route-domain-selection

NAME

route-domain-selection - Manages a Route Domain Selection agent.

MODULE

apm policy agent

SYNTAX

Configure the route-domain-selection component within the policy agent module using the syntax shown in the following sections.

CREATE/MODIFY

```
create route-domain-selection [name]
modify route-domain-selection [name]
options:
  app-service [[string] | none]
  location-specific [true | false]
  route-domain [[integer] | none]
  snat [automap | none]
  snatpool [[string] | none]
```

```
edit route-domain-selection [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list route-domain-selection
list route-domain-selection [ [ [name] | [glob] | [regex] ] ... ]
```

```

show running-config route-domain-selection
show running-config route-domain-selection [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

show route-domain-selection
show route-domain-selection [name]

DELETE
delete route-domain-selection [name]

DESCRIPTION
  You can use the route-domain-selection component to create a Route
  Domain Selection agent.

EXAMPLES
  create route-domain-selection my_rds ag route-domain 0 snat automap
  Creates the my_rds_ag Route Domain Selection agent.

  show route-domain-selection
  Displays a list of Route Domain Selection agents.

  delete route-domain-selection my_rd_selection_agent
  Deletes the Route Domain Selection agent named
  my_rd_selection_agent.

OPTIONS
  [name]
  Specifies the name of a Variable Assignment agent. This option is
  required.

  partition
  Displays the partition within which the component resides.

  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  location-specific
  Specifies whether or not this object contains one or more
  attributes with values that are specific to the location where the
  BIG-IP device resides. The location-specific attribute is either
  true or false. When using policy sync, mark an object as location-
  specific to prevent errors that can occur when policies reference
  objects, such as authentication servers, that are specific to a
  certain location.

  route-domain
  Specifies the route domain. The default is 0 (zero).

  snat
  automap
  none Snat is not used.

  snatpool

```

apm policy agent session-check

NAME
session-check - Manages a Session Check agent.

MODULE
apm policy agent

SYNTAX
Configure the session-check component within the policy agent module using the syntax shown in the following sections.

```

CREATE/MODIFY
create session-check [name]
modify session-check [name]
options:
  app-service [[string] | none]

```

```

edit session-check [ [ name ] | [ glob ] | [ regex ] ] ... ]
  options:
    all-properties
    non-default-properties

DISPLAY
list session-check
list session-check [ [ name ] | [ glob ] | [ regex ] ] ... ]
  options:
    all-properties
    non-default-properties
    partition

DELETE
delete session-check [name]

DESCRIPTION
  You can use the session-check component to create and manage an agent
  that check for the existence of access policy session in a flow.

EXAMPLES
  create session-check example_session_check_ag
  Creates the example_session_check_ag Session Check agent that
  performs the access policy session existence check for the flow.

  delete session-check ExampleSessionCheckAgent delete
  Deletes the Session Check agent named ExampleSessionCheckAgent.

OPTIONS
  [name]
  Specifies the name of a Session Check agent. This setting is
  required.

  partition
  Displays the partition within which the component resides.

  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

SEE ALSO
COPYRIGHT
  No part of this program may be reproduced or transmitted in any form or

```

```
options:
  all-properties
  non-default-properties
  partition
```

```
DELETE
delete ssl-check [name]
```

DESCRIPTION

You can use the ssl-check component to create and manage an agent that check for the existence of SSL traffic in a flow.

EXAMPLES

```
create ssl-check example_ssl_check_ag
Creates the example_ssl_check_ag SSL Check agent that performs the
SSL traffic existence check for the flow.
```

```
delete ssl-check ExampleSSLCheckAgent delete
Deletes the SSL Check agent named ExampleSSLCheckAgent.
```

OPTIONS

```
[name]
Specifies the name of a SSL Check agent. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

apm policy agent tacacsplus

NAME

tacacsplus - Manages a TACACS+ agent.

MODULE

apm policy agent

SYNTAX

Configure the tacacsplus component within the policy agent module using the syntax shown in the following sections.

```
CREATE/MODIFY
create tacacsplus
modify tacacsplus
options:
  app-service [[string] | none]
  max-logon-attempt [integer]
  server [[string] | none]
```

```
edit tacacsplus [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list tacacsplus
list tacacsplus [ [ [name] | [glob] | [regex] ] ... ]
show running-config tacacsplus
show running-config tacacsplus [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition
```

```

show tacacsplus
show tacacsplus [name]

DELETE
delete tacacsplus [name]

DESCRIPTION
You can use the tacacsplus component to create and manage a TACACS+
agent.

EXAMPLES
list tacacsplus all
Displays a list of TACACS+ agents.

delete tacacsplus my_tacacsplus_agent
Deletes the TACACS+ agent named my_tacacsplus_agent.

OPTIONS
[name]
Specifies the name of the component. This option is required.

app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

max-logon-attempt
Specifies the maximum number of opportunities that users have to
re-enter credentials after their first attempt to log in fails. If
you set this value to a number from 2 to 5 inclusive, the system
allows users the specified number of opportunities to log in after
the first attempt to log in fails. If you set the value to 1, the
system does not allow a second log in opportunity after a first
log in attempt fails. The default value is 3.

partition
Displays the partition within which the component resides.

server
Specifies the name of the TACACS+ server. This option is required.

SEE ALSO
COPYRIGHT

BIG-IP 2012-10-19 apm policy agent tacacsplus(1)

apm policy agent variable-assign

```

NAME
variable-assign - Manages a Variable Assignment agent.

MODULE
apm policy agent

SYNTAX
Configure the variable-assign component within the policy agent module
using the syntax shown in the following sections.

CREATE/MODIFY
create variable-assign [name]
modify variable-assign [name]
options:
app-service [[string] | none]
type [citrix-smart-access | general | intranet-webtop | sso-cred-mapping | virtual-keyboard]
variables { [varname [name] expression {[string] }}

edit variable-assign [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties

DISPLAY
list variable-assign
list variable-assign [ [ [name] | [glob] | [regex] ] ... ]
show running-config variable-assign
show running-config variable-assign [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
partition

show variable-assign

```

show variable-assign [name]

DELETE
delete variable-assign [name]

DESCRIPTION

You can use the variable-assign component to create and manage an agent that assigns one or more variables to an access policy. F5 Networks recommends that you use the visual policy editor to create complex variable assignments.

EXAMPLES

```
create variable-assign username_variable_assign_ag { variables {  
  varname "session.logon.last.username" expression "[mcget  
  {session.ssl.cert.cn}]" } }
```

Creates the username_variable_assign_ag Variable Assignment agent that automatically assigns the value of the common name field in the client certificate to the username field of the logon page. This is useful when an access policy contains the Variable Assignment agent between the client certification and the AAA Active Directory server query actions.

```
create variable-assign acl_variable_assign_ag { variables { varname  
  "config.connectivity_resource_network_access.MyprofileNR2.acl_name"  
  expression "expr {\\"MY_ACL1\\"" } }
```

Creates a Variable Assignment agent that carries out a configured ACL when a particular branch in the access policy is followed, using the Variable Assignment agent to populate the appropriate variables with the ACL name.

```
show variable-assign  
Displays a list of Variable Assignment agents.
```

```
delete variable-assign MyAssignVariableAgent delete  
Deletes the Variable Assignment agent named MyAssignVariableAgent.
```

OPTIONS

[name]
Specifies the name of a Variable Assignment agent. This setting is required.

partition
Displays the partition within which the component resides.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

type Specifies the type of agent. The default is general.

variables
Adds a variable to or deletes a variable from the Variable Assignment agent. You must specify the following attributes for each variable:

expression
A Tcl expression that the system evaluates, and then assigns the value of the expression to a specific property of the assigned Network Access resource or to a newly created session variable.

varname
A variable that forms the left-hand side of the expression. You can use the name of an existing variable or a new session variable.

show access [name]

DELETE
delete access [name]

DESCRIPTION

You can use the access component to configure an access profile. An access profile is a pre-configured group of settings that you can use to configure secure Network Access for an application.

EXAMPLES

```
create access MyAccessProfile { defaults-from access access-policy
  "my_access_policy" accepted-languages "my_accepted_languages" default-
  language "en" customization-group "company_logout" eps-group
  'myepsgroup' framework-installation-group "company_header"
  "company_footer" errormap-group "company_errormap" }
```

Creates an access profile named MyAccessProfile that is based on the default access profile named access, uses the access policy named my_access-policy, accepts the languages in the my_accepted_languages class, uses English as the default language, and uses these groups to customize the application pages and messages: company_logout, company_header, company_footer, and company_errormap.

```
list access all all-properties
```

Displays a list of access profiles, including parameter values.

```
delete access MyAccessProfile
```

Deletes the access profile named MyAccessProfile.

OPTIONS

accept-languages
Specifies the name of a class that defines the languages supported by the access profile. The default languages are en (English), ja (Japanese), zh-cn (simplified Chinese (PRC)), and zh tw (traditional Chinese (Taiwan)). This option is required.

access-policy
Specifies the access policy that you want to enforce using this access profile. An access policy contains various security checks that a client must pass before the BIG-IP Access Policy Manager grants access to a protected application. This option is required.

access-policy-timeout
Specifies, for this access profile, the number of seconds within which a user must complete the steps to gain access to an application. The default is 300 seconds. This option is designed to quickly release session resources when a user does not complete the access process, for example, when the user closes the browser before completing the access process.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the customization group that defines the appearance of the logout and error pages. This option is required.

default-language
Specifies the default language for the BIG-IP Access Policy Manager that you want to implement with this access profile. The default is en (English). If the client requests a language that is not supported, the BIG-IP Access Policy Manager uses the default value. This option is required.

defaults-from
Specifies the default access policy from which this profile is created. This option is required.

domain-cookie
Specifies a domain cookie to use with an application access control connection. If you specify a domain cookie, then the line domain=specified_domain is added to the MRHsession cookie. The default is none.

domain-groups
Specifies a group of multiple domains or multiple hosts in multiple domains to which a single user session has access. For example, you can use this option to configure a single user session to have access to three domains: www.a.com, www.b.com, and www.c.com. When a user logs in to any of these domains, that user can access the other domains without logging in again. This option is required when you set the domain-mode option to multi-domain. This option is ignored when you set the access domain-mode option to single-domain.

For each domain in the domain group, you can specify the following settings:

cookie-host
Specifies the host name for which to create the user's session cookie.

cookie-domain
Specifies the domain for which to create the user's session cookie.

`secure-cookie`
Adds a security attribute to the user's session cookie.

`persistent-cookie`
Adds a persistence attribute to the user's session.

`sso-name`
Specifies the SSO method to use when accessing a backend application.

`domain-mode`
Specifies how the SSO configuration is applied. The options are:

`single-domain`
Applies the SSO configuration to a single domain. This is the default.

When you set `domain-mode` to `single-domain`, you must also set the `sso-name` option.

`multi-domain`
Applies the SSO configuration across multiple domains. This option allows users a single APM login/session and applies the credentials across multiple Local Traffic Manager or Access Policy Manager virtual servers in front of different domains. Note that to apply SSO configurations across multiple domains, all virtual servers must be on one BIG-IP system.

When you set `domain-mode` to `multi-domain`, you must also configure the `domain-group` option, and provide a URI for the `primary-auth-service` option.

`user-identity-method`
Specifies how access will bind a session to a request.

`http` Use `http` information such as cookies and URI query string to identify user.

`ip-address`
Use IP address to identify a user. Do not use this setting if clients may be behind a NAT.

`eps-group`
This option is required.

`errormap-group`
Specifies the customization settings for the error map that you want to implement with this access profile. This setting is required.

`framework-installation-group`
Specifies the customization settings for the header and footer that you want to implement with this access profile. This setting is required.

`generation-ui-group`
Specifies the generation of the user interface group for the new generation access configuration. This option is required.

`generation-timeout`
Specifies the timeout, in seconds, for the new generation access configuration.

`generation-action`
`increment`
Activates the current access policy configuration for an access profile. For example, the following command activates current access policy configuration for profile `myAccessProfile`:
`tmsl modify apm profile access myAccessProfile generation-action increment`

`noop` Specifies "no operation to be performed". This is the default.

`sync` Specifies that the policy is being modified due to APM policy sync operation. This is an internal action; you should not set it.

`httponly-cookie`
Specifies whether `HttpOnly` directive should be inserted in HTTP response from BIG-IP. The client browser should prevent script from accessing cookie, if this flag is set in the response. The default is false.

`inactivity-timeout`
Specifies, for this access profile, the number of seconds that the session on the client can be idle before the server disconnects the VPN tunnel. The default is 900 seconds.

`logout-uri-include`
Specifies a list of URIs to include in the access profile for initiating session logout.

`logout-uri-timeout`
Specifies the timeout used to delay logout for the customized logout URIs defined in the `logout uri include list`

`log-settings`
Specifies one or more log-setting containers to associate with this profile

`max-concurrent-sessions`
Specifies, for this access profile, the number of concurrent

sessions allowed. The default is 0 (zero), which represents unlimited sessions. Users assigned an administrative role of Application Editor can view the value of this option. Users assigned any other administrative role can modify this option.

max-concurrent-users

Specifies, for this access profile, the number of concurrent sessions allowed. The default is 0 (zero), which represents unlimited sessions. This field is Read-only for Application Editors. Users assigned any other administrative role can modify this field.

max-failure-delay

Specifies the maximum random delay after authentication failure during the access policy. It is the maximum number of seconds before the user is shown an error message on the logon page and prompted to re-enter credentials. The default is 5 seconds. 0 (zero) represents no delay. Note: Set max-failure-delay to no more than one-half the access-policy-timeout value and no more than 65 seconds greater than min-failure-delay.

max-in-progress-sessions

Specifies the maximum number of in-progress concurrent sessions a user can have. The in-progress sessions are the sessions for which an access policy has not completed. The default is 0, which represents an unlimited number of such sessions.

max-session-timeout

Specifies the maximum lifetime of one session. The maximum lifetime is the number of seconds between session creation and session termination.

min-failure-delay

Specifies the minimum random delay after authentication failure during the access policy. It is the minimum number of seconds before the user is prompted for credentials again or shown an error message on the logon page. The default is 2 seconds.

[name]

Specifies the name of the access profile. This option is required.

oauth-profile

Specifies an oauth profile for use with an OAuth Authorization Server.

persistent-cookie

Specifies to retain the cookie for a user session, even when the user session is terminated, when set to true. Although this is an insecure method, this setting is useful and required in cases where you have a third-party application, such as Sharepoint, and need to store the cookie in a local database so that any attempt to access backend server applications through Access Policy Manager succeeds. The default is false.

primary-auth-service

Specifies the address of your primary authentication URI. This setting is required when you set the domain-mode option to multi-domain.

For example, when you set this option to <https://logon.yourcompany.com>, the user session is stored on this primary domain, and the user can access multiple backend applications from multiple domains and hosts without re-entering credentials.

restrict-to-single-client-ip

Specifies whether a user session is tied to a single client IP. If during session's lifetime, the user's client IP address changes, the current session is terminated. The user needs to re-login to create a new session from the new client IP address. The default is false.

sandboxes

Specifies the association between the access profile and the sandbox. If retain-public-access is set to true, this association is retained even if there is no resource that uses sandbox files in the access policy that corresponds to this access profile.

scope

Specifies the confining scope for sessions created by the profile. Set this option to profile (which is also the default-value) to confine the validity of a session to the profile from which it was created. Set this option to virtual-server to further confine the validity of a session to the virtual server from which it was created. Setting this option to global allows the session to be valid on any virtual server with any access profile that also specifies global scope.

secure-cookie

Set this option to true, if you want to add a secure keyword to the session cookie. Set this option to false, if you want to configure an application access control scenario that uses an HTTPS virtual server to authenticate the user, and then sends the user to an existing HTTP virtual server to use applications. The default is true.

sso-name

Specifies the SSO configuration that you want BIG-IP Access Policy Manager to use to submit the user's credentials to the backend application. This allows the user to log in once to the Access Policy Manager and then gain access to backend applications without logging in again.

type Specifies the type of access profile. You can specify the

following types for an access profile.

all Supports ltm-apm and ssl-vpn access types.

identity-service

Used internally to provide identity service for a supported integration. Only APM creates this type of profile.

ltm-apm

For web access management configuration.

oauth-resource-server

Supports apps and devices that use OAuth tokens but do not support cookies.

rdg-rap

For validating connections to hosts behind APM when APM acts as a gateway for RDP clients.

ssl-vpn

For network access, portal access, or application access.

sso For configuring matching virtual servers for Single Sign-On (SSO).

swg-explicit

For Secure Web Gateway explicit forward proxy.

swg-transparent

For Secure Web Gateway transparent forward proxy.

system-authentication

For configuring administrator access to the BIG-IP system (when using APM as a pluggable authentication module).

use-http-503-on-error

Set this option to true to use HTTP response code 503 for error pages sent by BIG-IP Access Policy Manager to clients. Set this option to false to use HTTP response code 200. The default is false.

DESCRIPTION

You can use the connectivity component to configure a connectivity profile. By using the connectivity profile, you can configure L2 and L4 tunnels, compression, Windows and mobile client settings, and client component downloads from F5 Networks and Citrix.

EXAMPLES

```
create connectivity myconnectivityprofile { }
```

Creates a connectivity profile named myconnectivityprofile that inherits its settings from the system default connectivity profile.

OPTIONS

adaptive-compression

Enables or disables adaptive compression. Use this option to configure compression settings for application tunnels and to optimize applications and RDP traffic. The default is enabled.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

citrix-client-bundle

Specifies the Citrix client bundle used by this connectivity profile. The default is default-citrix-client-bundle.

client-policy

Adds, deletes, or modifies the client policy for any of the following clients:

android-ec Android Edge Client

android-ep Android Edge Portal

chromeos-ec Chrome OS Edge Client

macos-ec Mac OS F5 Access

ec Windows/OSX Edge Client

ios-ec iOS Edge Client

ios-ep iOS Edge Portal

Options (please refer to the SYNTAX section to see if a certain option is supported for a particular client):

component-update

Specifies how the client handles automatic updates. The options are:

yes Automatically installs a client update when one is available.

prompt

Prompts the user about installing a client update.

No Disables the client from receiving automatic updates.

device-lock-method

Specifies the device lock quality that the client should enforce on the device. The options are:

alphanumeric

Device passcode must contain at least alphanumeric (or other symbol) characters.

alphanumeric

Device passcode must contain at least both numeric and alphanumeric (or other symbol) characters.

any A device passcode must be set but does not matter what it is.

numeric

Device passcode must contain at least numeric characters.

enable-mobilesafe

Enables or disable MobileSafe checks. Use this option to configure whether client should execute the MobileSafe security checks as part of the logon. The default is false.

enforce-device-lock

Specifies whether client should enforce a device passcode policy on the device. The default is true.

enforce-logon-mode

Specifies whether client should enforce a logon mode on the device. The default is false. Set to true if external logon page is used.

logon-mode

Specifies logon mode to be enforced on the device. The default is native. Set to web if external logon page is used.

enforce-pin-lock

Specifies whether client should enforce an app-level PIN before allowing access to the app. The default is true.

location-dns

Specifies a list of DNS suffixes used by the Network Location Awareness feature of the client. This list represents the internal network where local resources are available without the need of a Network Access connection. The default is none.

max-grace-period

Specifies the length of time (in minutes) the app was taken to the background before the user will be asked for a PIN. With the option set to 0, user will be asked for the PIN every time the app is taken from the background. The default is 2.

max-inactivity-time

Sets the length of time (in minutes) since the user last touched the screen or pressed a button before the device locks the screen. The default is 5.

min-passcode-length

Specifies the minimum required number of characters for the device passcode. The default is 4.

require-device-auth

Specifies whether device authentication is needed before accessing cached credentials. The default is false.

reuse-winlogon-creds

Specifies whether client can reuse logon credentials entered by a user for a subsequent log in. The default is false.

reuse-winlogon-session

Specifies whether client should attempt to use the same Windows logon session. The default is false.

save-password

Specifies whether client allows user password caching. The default is false.

save-password-method

Specifies whether client saves encrypted passwords on disk or caches passwords in memory only. The default is disk.

save-password-timeout

Specifies the number of minutes that a cached password remains valid (applies only to in-memory password caching). The default is 240.

save-servers-on-exit

Specifies whether client maintains a list of Access Policy Manager systems that the client accessed. The default is true.

servers

Specifies a list of server and alias pairs in the client's server list.

compress-buffer-size

Specifies the size of compressed data for Network Access tunnels. The default is 4096.

compress-cpu-saver

Specifies whether the system monitors the percentage of CPU usage and adjusts compression rates automatically when CPU usage reaches either the CPU saver high threshold or the CPU saver low threshold. The default is true.

compress-cpu-saver-high

Specifies the percentage of CPU usage at which the system starts automatically decreasing the amount of content being compressed, as well as the amount of compression which the system is applying. The default is 90 percent.

compress-cpu-saver-low

Specifies the percentage of CPU usage at which the system resumes content compression at the user-defined rates. The default is 75 percent.

compress-gzip-level

Specifies the degree to which the system compresses the content. Higher compression levels slow down the compression process. The default is 6, which provides a higher amount of compression at the expense of more CPU processing time. 1 is the lowest level and 9 is the highest level. 0 disables compression.

compress-gzip-memlevel

Specifies the number of kilobytes of memory that the system uses for internal compression buffers when compressing data. You can select a value between 1 and 256. The default is 8192.

compress-gzip-window-size

Specifies the number of kilobytes in the window size that the system uses when compressing data. You can select a value between 1 and 128. The default is 16384.

compress-ingress

Specifies whether incoming data is compressed. The default is false.

compress-preferred-method

Specifies the preferred method of data compression. The default is zlib.

compression

Enables or disables compression between the client and the server. The default is enabled.

compression-codecs

Specifies the available compression codecs for server-to-client connections. The server compares the available compression types you configure with the available compression types on the client, and then chooses the most effective mutual compression setting. Compression for the client is configured separately. The default includes all three available codecs:

lzo Offers a balance between CPU resources and compression ratio, compressing more than deflate, but with less CPU resources than bzip2.

deflate

Uses the least CPU resources, but compresses the least effectively.

bzip2

Uses the most CPU resources, but compresses the most effectively.

customization-group

Specifies which customization groups are applied. This option is required.

defaults-from

Specifies the profile from which this profile inherits properties that are not specified explicitly. The default is connectivity.

deflate-compression-level

Specifies the level of compression performed by the deflate codec. The default is 1.

description

Specifies a user-defined description for the connectivity profile.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies the profile that you want to use as the parent profile. The new profile inherits all settings and values from the parent profile.

tunnel-name

Specifies the name of the tunnel through which data passes. The default is none.

DESCRIPTION

You can use the exchange component to configure an exchange profile. An exchange profile is a preconfigured group of settings that you can use to configure authentication for exchange services such as Outlook Anywhere, ActiveSync, Autodiscover and Offline Address Book, so that those work with BIG-IP.

EXAMPLES

```
create exchange MyExchangeProfile {
  ntlm-auth-name "MyNTLMAuth"
  rpc-over-http-url "/rpc/rpcproxy.dll"
  rpc-over-http-auth-type ntlm
  rpc-over-http-sso-config "MyKerberosSSOConfig"
}>
```

Creates an exchange profile named MyExchangeProfile that is based on the general settings such as NTLM Authentication configuration MyNTLMAuth. The profile is configured for Outlook Anywhere (RPC over HTTP) service with url "/rpc/rpcproxy.dll", client authentication type ntlm and SSO configuration type MyKerberosSSOConfig

```
list exchange all all-properties
```

Displays a list of exchange profiles, including parameter values.

```
delete access MyExchangeProfile
```

Deletes the exchange profile named MyExchangeProfile.

OPTIONS

ntlm-auth-name

Specifies the NTLM configuration object that clients can use to authenticate on the front-end. Backend SSO type must be Kerberos for ntlm or basic-ntlm front end.

active-sync-auth-type

Specifies the client-side authentication type for ActiveSync exchange service. The valid value is basic.

active-sync-sso-config

Specifies the back end SSO config for ActiveSync exchange service. This is optional.

active-sync-url

Specifies the URL for ActiveSync exchange service. URL is required for ActiveSync service to be enabled through BIG-IP.

auto-discover-auth-type

Specifies the client-side authentication type for Autodiscover exchange service. The valid values are basic, ntlm and basic-ntlm.

auto-discover-sso-config

Specifies the back end SSO config for Autodiscover exchange service. This is optional.

description

Specifies a user-defined description for the exchange profile.

auto-discover-url

Specifies the URL for Autodiscover exchange service. URL is required for Autodiscover service to be enabled through BIG-IP.

offline-address-book-auth-type

Specifies the client-side authentication type for Offline Address Book exchange service. The valid values are basic, ntlm and basic-ntlm.

offline-address-book-sso-config

Specifies the back end SSO config for Offline Address Book exchange service. This is optional.

offline-address-book-url
Specifies the URL for Offline Address Book exchange service. URL is required for Offline Address Book service to be enabled through BIG-IP.

rpc-over-http-auth-type
Specifies the client-side authentication type for Outlook Anywhere (RPC over HTTP) exchange service. The valid values are basic, ntlm and basic-ntlm.

rpc-over-http-sso-config
Specifies the back end SSO config for Outlook Anywhere (RPC over HTTP) exchange service. This is optional.

rpc-over-http-url
Specifies the URL for Outlook Anywhere (RPC over HTTP) exchange service. URL is required for Outlook Anywhere (RPC over HTTP) service to be enabled through BIG-IP.

user-agent-pattern-for-utf8
Specifies the user agent pattern for UTF8.

web-service-auth-type
Specifies the client-side authentication type for Web Exchange service. The valid values are basic, ntlm and basic-ntlm.

web-service-sso-config
Specifies the back end SSO config for Web Exchange service. This is optional.

web-service-sync-url
Specifies the URL for Web Exchange service. URL is required for Web Service to be enabled through BIG-IP.

options:
  all-properties
  non-default-properties
  partition

```

```

show oauth
show oauth [name]

```

```

DELETE
delete oauth [name]

```

DESCRIPTION

You can use the oauth component to configure an oauth profile. An oauth profile is a pre-configured group of settings that you can use to configure OAuth Authorization Server.

NOTE: For the oauth profile to take effect, this profile must be associated with an access profile. (See man page for apm access profile.)

EXAMPLES

```

create oauth myOAuthProfile {
defaults-from oauth
client-apps add { client_1 client_2}
resource-servers add { rs_1 rs_2}
opaque-token enabled
db-instance db_test
jwt-token enabled
openid-connect enabled
issuer https://example.f5.com
primary-key jwk1_hs256
id-token-primary-key jwk1_rs256
generate-jwt-refresh-token true
jwt-refresh-token-enc-secret password
auth-url /f5-oauth2/v1/authorize
token-issuance-url /f5-oauth2/v1/token
token-revocation-url /f5-oauth2/v1/revoke
token-introspection-url /f5-oauth2/v1/introspect
openid-cfg-url /f5-oauth2/v1/.well-known/openid-configuration
jwks-url /f5-oauth2/v1/jwks
userinfo-url /f5-oauth2/v1/userinfo
}

```

Creates an oauth profile named myOAuthProfile that is based on the default oauth profile named oauth. The profile serves OAuth requests from client applications named client_1 and client_2 and resource servers named rs_1 and rs_2.

The profile is configured to generate both Opaque and JWT access tokens. For Opaque access token, it uses db instance named db_test. For JWT access token, it uses issuer named https://example.f5.com, primary key named jwk1_hs256 to sign JWT tokens and JWT refresh token encryption secret named password for encryption of refresh token generated with the JWT access token. The profile also supports OpenID Connect. It uses key named jwk1_rs256 to sign ID Tokens.

It uses /f5_oauth2/v1/authorize as the authorization endpoint, /f5-oauth2/v1/token as token issuance endpoint, /f5-oauth2/v1/revocation as revocation endpoint, /f5-oauth2/v1/introspect as token introspection endpoint for validating Opaque tokens, /f5-oauth2/v1/.well-known/openid-configuration as OpenID Connect metadata configuration endpoint, /f5-oauth2/v1/jwks as JWKS

endpoint and /f5-oauth2/v1/userinfo as UserInfo endpoint.

list oauth all all-properties

Displays a list of oauth profiles, including parameter values.

delete oauth myOAuthProfile

Deletes the oauth profile named myOAuthProfile.

OPTIONS

access-token-lifetime

Specifies the number of minutes for which the access token should be valid. The default is 5 minutes.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

audience

Specifies the audience claim for which the JWT access token is intended. This is a list of values. Each value in this list can be a string, URI, or session variable.

auth-code-lifetime

Specifies the number of minutes for which the authorization code should be valid. The default is 5 minutes.

auth-url

Specifies the path of the authorization endpoint that is used to authenticate the resource owner and provide the authorization code. The default is /f5-oauth2/v1/authorize.

client-apps

Specifies the list of client applications that is served by the OAuth Authorization Server associated with this profile.

db-instance

Specifies the db instance that is used to store tokens generated by the OAuth Authorization Server that is associated with this profile.

defaults-from

Specifies the default oauth profile from which this profile is created. The default is oauth.

generate-jwt-refresh-token

Specifies whether a refresh token should be generated along with the JWT access token. This is applicable only for "Authorization Code" and "Resource Owner Password Credentials" grant types. The default is true.

generate-refresh-token

Specifies whether a refresh token should be generated along with the access token. This is applicable only for "Authorization Code" and "Resource Owner Password Credentials" grant types.

id-token-claims

Specifies the list of claims that are part of ID token.

id-token-lifetime

Specifies the number of minutes for which the ID token should be valid. The default is 5 minutes.

id-token-primary-key

Specifies the JWK config that is used to retrieve the shared key (symmetric) or private key (asymmetric) used to sign ID token. If the key is asymmetric, the configured public key will be returned as part of JWKS URL response.

ignore-expired-cert

Specifies whether to ignore the expiry of the certificate used for signing JWT access token. If this value is true, then the certificate will be used for signing JWT access token even if it is expired. The default is false.

issuer

Specifies the issuer claim that is part of JWT access token. This value must be a URI.

jwt-url

Specifies the path of the JWKS endpoint that returns public signing keys. These keys are used by OAuth Resource Servers to verify the digital signature of JWT access token. The default is /f5-oauth2/v1/jwks.

jwt-access-token-claims

Specifies the list of claims that are part of JWT access token.

jwt-access-token-lifetime

Specifies the number of minutes for which the JWT access token should be valid. The default is 5 minutes.

jwt-ec-signature-format

Specifies the JWT token signature format for Elliptic Curve. The default is binary format.

jwt-refresh-token-enc-secret

Specifies the JWT refresh token encryption secret that is used to generate an encryption key. This key is used to encrypt the refresh token when JWT token is enabled.

`jwt-refresh-token-lifetime`
Specifies the number of minutes for which the JWT refresh token should be valid. The default is 60 minutes.

`jwt-token`
Specifies whether JWT access token should be generated. The default is false.

`opaque-token`
Specifies whether opaque (non-JWT) access token should be generated. The default is true.

`openid-cfg-url`
Specifies the path of OpenID Connect endpoint that returns OpenID Connect configuration. The default is `/f5-oauth2/v1/.well-known/openid-configuration`.

`openid-connect`
Specifies whether this OAuth profile supports OpenID connect or not.

`per-user-token-limit`
Specifies the maximum number of active access tokens that can be generated for a user. The default is 255. The range is 0 to 5000.

`primary-key`
Specifies the JWK config that is used to retrieve the shared key (symmetric) or private key (asymmetric) used to sign JWT access token. If the key is asymmetric, the configured public key will be returned as part of JWKS URL response.

`refresh-token-lifetime`
Specifies the number of minutes for which the refresh token should be valid. The default is 480 minutes.

`refresh-token-usage-limit`
Specifies the maximum number of times the access token can be obtained using the refresh token request. The default value is 0, which represents unlimited number of times.

`resource-servers`
Specifies the list of resource servers that is served by the OAuth Authorization Server that is associated with this profile.

`reuse-access-token`
Specifies whether an access token is reused or a new access token is generated when it is obtained using refresh token request. When the access token is reused, its expiry time is extended.

`reuse-refresh-token`
Specifies whether a refresh token is reused or a new refresh token is generated when it is obtained using refresh token request.

`rotation-keys`
Specifies one or more JWK configs that contain public keys used as rotation keys. The public keys derived from this set will be returned as part of JWKS URL response.

`subject`
Specifies the subject claim that is part of JWT access token. This value can be a string, URI, or session variable. The default is `#{session.assigned.uuid}`

`token-issuance-url`
Specifies the path of token issuance endpoint that is used to issue an access token and possibly a refresh token. The default is `/f5-oauth2/v1/token`.

`token-revocation-url`
Specifies the path of token revocation endpoint that is used to revoke an access token or a refresh token. The default is `/f5-oauth2/v1/ revoke`.

`token-introspection-url`
Specifies the path of token introspection endpoint that is used to introspect an access token. The default is `/f5-oauth2/v1/introspect`.

`trusted-ca-bundle`
Specifies the trusted ca bundle that is used during verification of JWK config specified in `primary-key` that uses asymmetric key.

`userinfo-claims`
Specifies the list of claims that are part of UserInfo.

`userinfo-primary-key`
Specifies the JWK config that is used to retrieve the shared key (symmetric) or private key (asymmetric) used to sign UserInfo. If the key is asymmetric, the configured public key will be returned as part of JWKS URL response.

`userinfo-url`
Specifies the path of userinfo endpoint that is used to obtain claims about the authenticated end-user. The default is `/f5-oauth2/v1/userinfo`.

apm profile remote-desktop

NAME
remote-desktop - Displays information about a default profile that supports a Citrix remote desktop resource.

MODULE
apm profile

SYNTAX
Displays the properties of the remote-desktop component within the profile module.

DISPLAY
list remote-desktop
list remote-desktop [[[name] | [glob] | [regex]] ...]
show running-config remote-desktop
show running-config remote-desktop [[glob] | [regex]] ...]
options:
all-properties
location-specific [true | false]
non-default-properties
one-line

DESCRIPTION
You can use the remote-desktop component to display the properties of the default remote desktop profile.

A remote desktop profile is for internal use only. You should not create or modify a remote desktop profile.

EXAMPLES
list remotedesktop all-properties

Displays all of the properties of the default remote desktop profile.

OPTIONS
location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

BIG-IP 2016-03-14 apm profile remote-desktop(1)

apm profile vdi

NAME
vdi - Configures a VDI profile.

MODULE
apm profile

SYNTAX

Configure the vdi component within the profile module using the syntax shown in the following sections.

```
CREATE/MODIFY
create vdi [name]
modify vdi [name]
options:
  msrdp-ntlm-auth-name [[string] | none]
  citrix-storefront-replacement [enabled | disabled]
```

```
edit vdi [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list vdi
list vdi [ [ [name] | [glob] | [regex] ] ... ]
show running-config vdi
show running-config vdi [ [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete vdi [name]
```

DESCRIPTION
You can use the vdi component to configure a VDI profile. A VDI profile is a group of settings that you can use to enable and configure VDI services such as Citrix, VMware View and MSRDP, so that those work with the BIG-IP system.

EXAMPLES

```
create vdi MyVdiProfile {
  msrdp-ntlm-auth-name "MyNTLMAuth"
  citrix-storefront-replacement disabled
}
```

Creates a VDI profile named MyVdiProfile with NTLM Authentication configuration MyNTLMAuth to be used for MSRDP clients authentication.

```
list vdi all-properties
```

Displays a list of VDI profiles, including parameter values.

```
delete vdi MyVdiProfile
```

Deletes the VDI profile named MyVdiProfile.

OPTIONS

msrdp-ntlm-auth-name
Specifies the NTLM auth configuration object to be used by this VDI profile for MSRDP client authentication.

citrix-storefront-replacement
Specifies whether Citrix StoreFront functionality is enabled on APM. When this option is enabled, APM will respond to StoreFront-specific requests from Citrix Receiver clients. When disabled, APM will fallback to PNAgent protocol.

apm report custom-report-field

NAME
custom-report-field - Configures a custom report field.

MODULE
apm report

SYNTAX
Configure the custom-report-field component within the custom-report module using the syntax shown in the following sections.

```
CREATE/MODIFY
create custom-report-field name [string] field-id [integer] field-position [integer] report-name [string]
options
  alias [string]
  app-service [string]
```

```
    sort-direction [asc|desc|unsorted]
    sort-order [integer]
modify custom-report-field [alias | app-service | field-id | field-position | name | report-name | sort-direction | so
options
    alias [string]
    app-service [string]
    field-position [integer]
    report-name [string]
    sort-direction [asc|desc|unsorted]
    sort-order [integer]
```

DISPLAY

```
list custom-report-field
list custom-report-field [alias | app-service | field-id | field-position | name | report-name | sort-direction | sort
```

DESCRIPTION

Configures a custom report field with options.

It is highly recommended that you use the web GUI to configure this custom object.

EXAMPLES

```
create alias UserName field-id 12 field-position 1 name
APDNOTICE_USERNAME.User_Name report-name cust1 sort-direction asc
sort-order 100000
```

Creates a custom-report-field named UserName under custom report named cust1, field-position is 1, sort direction is ascending and sort-order is 100000.

Note: Some field-id's and names are predefined and fixed values and not customizable, see below for details:

```
    apm report custom-report-field {
field-id 21
name APDNOTICE_CLIENT_INFO.Client_Version
    }
    apm report custom-report-field {
field-id 19
name APDNOTICE_CLIENT_INFO.Client_UI_Mode
    }
    apm report custom-report-field {
field-id 16
name APDNOTICE_ASSIGN_WEBTOP_LINKS.Webtop_Links
    }
    apm report custom-report-field {
field-id 18
name APDNOTICE_ACCESS_POLICY_RESULT.Access_Policy_Result
    }
    apm report custom-report-field {
field-id 20
name APDNOTICE_CLIENT_INFO.Client_Type
    }
    apm report custom-report-field {
field-id 15
name APDNOTICE_ASSIGN_WEBTOP.Webtop_Name
    }
    apm report custom-report-field {
field-id 13
name APDNOTICE_ASSIGN_ACL.ACL_variable
    }
    apm report custom-report-field {
field-id 12
name APDNOTICE_USERNAME.User_Name
    }
    apm report custom-report-field {
field-id 14
name APDNOTICE_ASSIGN_RESOURCE.resource_var
    }
    apm report custom-report-field {
field-id 17
name APDNOTICE_CLIENT_INFO.Client_Platform
    }
```

OPTIONS

alias

Specifies the alias of the custom report field.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

field-id

Specifies a unique id of the custom report field. This item is fixed and not customizable.

field-position

Specifies field's position among all available fields.

name

Specifies a unique name for the custom report field. This item is fixed and not customizable.

report-name

Specifies the custom report that the custom-report-field belongs to.

sort-direction

Specifies the sort direction of the custom-report-field. It can be asc, desc, or unsorted. Default is asc.

sort-order

Specifies the sort order of the custom-report-field. Default is 100000.

SEE ALSO

BIG-IP 2016-03-14 apm report custom-report-field(1)

apm resource app-tunnel

NAME

app-tunnel - Configures an application tunnel.

MODULE

apm resource

SYNTAX

Configure the app-tunnel component within the resource module using the syntax shown in the following sections.

CREATE/MODIFY

```
create app-tunnel [name]
modify app-tunnel [name]
options:
  acl-order [integer]
  app-service [[string] | none]
  application-launch-warning [true | false]
  apps [add | delete | modify | replace-all-with] {
    [name]
  }
  customization-group [add | delete | modify | replace-all-with] {
    [name]
  }
  description [[string] | none]
  location-specific [true | false]
  type [app-tunnel | last | network-access | remote-desktop | web-application]
```

```
edit app-tunnel [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list app-tunnel
list app-tunnel [ [ [name] | [glob] | [regex] ] ... ]
show running-config app-tunnel
show running-config app-tunnel [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

```
show app-tunnel
show app-tunnel [name]
```

DELETE

```
delete app-tunnel [name]
```

DESCRIPTION

You can use the app-tunnel component to configure an application tunnel to provide secure access to a network, remote desktop, or specific applications.

EXAMPLES

```
item create app-tunnel myapptunnel customization-group
myapptunnelcg
```

Creates an application tunnel named myapptunnel that uses the policies in the customization group myapptunnelcg.

```
item delete app-tunnel myapptunnel
```

Deletes the application tunnel named myapptunnel.

OPTIONS

acl-order

Specifies the location of this app tunnel in the ACL hierarchy in Access Policy Manager ACL lists. The default is 0 (zero).

app-service

Specifies the name of the application service to which the object

belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

application-launch-warning
Specifies whether to display a warning before launching an application. The options are:

true The system displays security warnings before launching an application, regardless of whether the site is considered a Trusted site. This is the default value.

false
The system displays security warnings before launching an application, only if the site is not in the Trusted Sites list.

apps Specifies the applications that a user can access using this application tunnel. The default is none.

customization-group
Specifies whether customizations are applied to the application tunnel. You can add, modify, delete, or replace all customization groups. This option is required.

description
Specifies a description for the application tunnel. The default is none.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies a name for the component.

partition
Displays the partition within which the app-tunnel component resides. The default is common.

type Specifies the type of application tunnel. The options are:

app-tunnel
This is the default.

network-access
Provides access to a network.

remote-desktop
Provides access to a remote desktop.

web-application
Provides access to a Web application.

COPYRIGHT

BIG-IP 2016-03-14 apm resource app-tunnel(1)

apm resource client-rate-class

NAME
client-rate-class - Configures a client rate class resource.

MODULE
apm resource

SYNTAX
Configure the client-rate-class component within the resource module using the syntax shown in the following sections.

CREATE/MODIFY
create client-rate-class [name]
modify client-rate-class [name]
options:
app-service [[string] | none]
burst [integer]
ceiling [integer]

```

description [[string] | none]
dscp [integer]
location-specific [true | false]
mode [borrow | discard | shape]
rate [integer]
type [best-effort | controlled-load | guaranteed]

edit client-rate-class [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list client-rate-class
list client-rate-class [ [ [name] | [glob] | [regex] ] ... ]
show running-config client-rate-class
show running-config client-rate-class [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

show client-rate-class
show client-rate-class [name]

DELETE
delete client-rate-class [name]

DESCRIPTION
You can use the client-rate-class component to configure a client rate
class resource, which is used in traffic control.

EXAMPLES
  create client-rate-class sfl{ dscp 40 rate 60000 ceiling 80000 mode
  shape }
Creates a client rate class resource named sfl used in traffic
control. Sets the dscp to 40 and the rate to 60000, sets the
ceiling to 80000, and sets the mode to shape.

  list client-rate-class all
Displays a list of all client rate class on the system.

  delete client-rate-class sfl
Deletes the client rate class named sfl from the system.

OPTIONS
  app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

  burst
Specifies in bytes the maximum amount of data that can reach the
ceiling rate at one time. The default is 0 (zero).

  ceiling
Specifies how far, beyond the value specified for the rate option,
that traffic can flow when bursting. This number sets an absolute
limit. No traffic can exceed this rate. The rate class might limit
traffic throughput to the value of the rate option when there is
high contention among siblings of a parent-child class hierarchy.
The default value is the value of the rate option. The minimum
value is 296 bp.

  description
Specifies a description for the client rate class. The default is
none.

  dscp
Specifies six bits of DS field used as a codepoint to select the
PHB (Per Hop Behavior) for a packet in each network node. The
default is -1.

  location-specific
Specifies whether or not this object contains one or more
attributes with values that are specific to the location where the
BIG-IP device resides. The location-specific attribute is either
true or false. When using policy sync, mark an object as location-
specific to prevent errors that can occur when policies reference
objects, such as authentication servers, that are specific to a
certain location.

  [name]
Specifies a unique name to identify the client rate class.

  mode
Specifies the mode to use for this client rate class. The options
are:

  borrow
Allows traffic on the client rate class to borrow resources
from other flows that are temporarily idle. Traffic that
borrows resources is marked as nonconforming and receives a
lower priority. This is the default.

  discard
Discards packets that do not conform to the specified traffic
control descriptor.

  shape
Delays packets submitted for transmission until the packets
conform to the specified flow parameters

  partition
Displays the partition within which this component resides. The

```

default is common.

rate Specifies the guaranteed throughput rate of the traffic handled by this rate class. You can configure the rate in bits per second (bps), kilobits per second (Kbps), megabits per second (Mbps), or gigabits per second (Gbps).

type Specifies the service type in use for the client rate class. The options are:

best-effort

Windows traffic control creates a flow for this client traffic class, and traffic on the flow is handled with the same priority as other Best Effort traffic. This is the default.

controlled-load

Traffic control transmits a very high percentage of packets to the intended receivers. Packet loss for this type closely approximates the basic packet error rate of the transmission medium. Transmission delay for a very high percentage of the delivered packets does not greatly exceed the minimum transit delay experienced by any successfully delivered packet.

guaranteed

Guarantees that datagrams arrive within a specified delivery time and will not be discarded due to queue overflows, provided that the flow of traffic stays within specified traffic parameters. This type is intended for applications that require guaranteed packet delivery.

apm resource client-traffic-classifier

NAME

client-traffic-classifier - Configures client traffic classifier entries.

MODULE

apm resource

SYNTAX

Configure the client-traffic-classifier component within the resource module using the syntax shown in the following sections.

CREATE/MODIFY

```
create client-traffic-classifier [name]
modify client-traffic-classifier [name]
options:
  app-service [[string] | none]
  entries [add | delete | modify | replace-all-with] {
    [name] {
      app-service [[string] | none]
      client-rate-class [[string] | none]
      dst-ip [[ipv4 address] | none]
      dst-mask [[integer] | none]
      dst-port [[integer] | none]
      protocol [[integer] | none]
      src-ip [[ipv4 address] | none]
      src-mask [[integer] | none]
      src-port [[integer] | none]
    }
  }
  location-specific [true | false]
}

edit client-traffic-classifier [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list client-traffic-classifier
list client-traffic-classifier [ [name] | [glob] | [regex] ] ... ]
show running-config client-traffic-classifier
show running-config client-traffic-classifier [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

```
app-service
non-default-properties
one-line
partition
```

```
show client-traffic-classifier
show client-traffic-classifier [name]
```

```
DELETE
delete client-traffic-classifier [name]
```

DESCRIPTION

You can use the client-traffic-classifier component to configure a client traffic classifier, which is used by traffic control agent.

EXAMPLES

```
create client-traffic-classifier tfl{ entries entry1 { protocol "6"
dst-ip "192.168.0.0" dst-mask "255.255.0.0" dst-port "0" client-rate-
class "sf1" }
entry2{protocol "6"
src-ip "10.10.0.0"
src-mask "255.255.255.0"
client-rate-class "sf2"}}}
```

Creates a client traffic classifier named tfl, sets the entry to entry1, the protocol to 6, the DST IP to 192.168.0.0, the DST mask to 255.255.0.0, the DST port to 0 (zero), and the client rate class to sf1.

```
list client-traffic-classifier all
Displays a list of all client traffic classifiers on the system.
```

```
modify client-traffic-classifier tfl entries entry1 protocol 17
Modifies the client traffic classifier named tfl.
```

```
delete client-traffic-classifier tfl
Deletes the client traffic classifier named tfl from the system.
```

OPTIONS

```
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
```

```
dst-ip
Specifies the IP address of the receiver of the packet.
```

```
dst-mask
Specifies the subnet mask for the destination address.
```

```
dst-port
Specifies the 16-bit number to identify the sending port for either UDP or TCP network application.
```

```
location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.
```

```
[name]
Specifies the name of the component.
```

```
partition
Displays the partition within which the component resides. The default is Common.
```

```
protocol
Specifies which traffic protocol to use in the filtering rule.
```

```
src-ip
Specifies the address from which the packet is being sent.
```

```
src-mask
Specifies the subnet mask for the source address.
```

```
src port
Specifies a 16-bit number to identify the sending port for either UDP or TCP network application.
```

apm resource ipv6-leasepool

NAME
ipv6-leasepool - Configures a lease pool.

MODULE
apm resource

SYNTAX
Configure the ipv6-leasepool component within the resource module using the syntax shown in the following sections.

CREATE/MODIFY
create ipv6-leasepool [name]
modify ipv6-leasepool [name]
options
 app-service [[string] | none]
 description [[string] | none]
 location-specific [true | false]
 members [add | delete | modify | replace-all-with] {
 [[first ip address in range] - [last ip address in range]]
 }

DISPLAY
list ipv6-leasepool
list ipv6-leasepool [[[name] | [glob] | [regex]] ...]
show running-config ipv6-leasepool
show running-config ipv6-leasepool [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 partition

show ipv6-leasepool
show ipv6-leasepool [name]

DELETE
delete ipv6-leasepool [name]

DESCRIPTION
Configures an IPv6 lease pool to create a collection of IPv6 addresses grouped as a single object. You can use a lease pool to associate that collection of IP addresses with a network access resource.

EXAMPLES
create ipv6-leasepool myipv6-leasepool {fd1f::1-fd1f::64}

Creates a ipv6-leasepool named myipv6-leasepool that contains the IPv6 addresses in the range fd1f::1 - fd1f::64.

Note: No spaces are allowed between the first IPv6 address, hyphen, and second IPv6 address.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description
Specifies a unique description of the lease pool.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies a unique name for the lease pool.

members
Specifies a range of IPv6 addresses separated by a hyphen.

partition
Displays the partition within which the component resides. The default is Common.

SEE ALSO
apm profile, ltm virtual

show running-config leasepool [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show leasepool
show leasepool [name]

DELETE
delete leasepool [name]
```

DESCRIPTION
Configures a lease pool to create a collection of IPv4 addresses grouped as a single object. You can use a lease pool to associate that collection of IPv4 addresses with a network access resource.

EXAMPLES
create leasepool myleasepool {10.10.10.1-10.10.10.10}

Creates a leasepool named myleasepool that contains the IPv4 addresses in the range 10.10.10.1 - 10.10.10.10.

Note: No spaces are allowed between the first IPv4 address, hyphen, and second IPv4 address.

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description
Specifies a unique description of the lease pool.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies a unique name for the lease pool.

members
Specifies a range of IP addresses separated by a hyphen.

partition
Displays the partition within which the component resides. The default is Common.

show network-access
show network-access [name]
```

```
DELETE
delete network-access [name]
```

DESCRIPTION

You can use the network-access component to configure the general settings for a network access connection.

EXAMPLES

```
create network-access mynetwork-access customization-group mynetaccess
Creates a network access connection configuration object named mynetwork-access that uses the policies in the customization group named mynetaccess.
```

```
delete network-access mynetwork-access
Deletes the network access connection configuration object named mynetwork-access.
```

OPTIONS

```
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
```

```
address-space-dhcp-requests-excluded
Specifies whether requests from IP addresses using DHCP are excluded from accessing the network. The default is true.
```

```
address-space-exclude-subnet
Specifies the IPv4 address spaces whose traffic you want to exclude from access to a subnet on the network. The default is none.
```

```
ipv6-address-space-exclude-subnet
Specifies the IPv6 address spaces whose traffic you want to exclude from access to a subnet on the network. The default is none.
```

```
address-space-include-dns-name
Specifies a list of domain names describing the target LAN DNS addresses for split tunneling only. You can add multiple address spaces to the list. For each address space, type the domain name, in the form site.siterequest.com or *.siterequest.com. The default is none.
```

```
address-space-exclude-dns-name
Specifies the DNS address spaces whose traffic you want to exclude from access to a subnet on the network. You can add multiple address spaces to the list. For each address space, type the domain name, in the form site.siterequest.com or *.siterequest.com. The default is none.
```

```
address-space-include-subnet
Specifies a list of IPv4 addresses or address/mask pairs describing the target LAN. When using split tunneling, only the traffic to these addresses and network segments goes through the tunnel configured for Network Access. You can add multiple address spaces to the list. For each address space, type the IPv4 address and network mask. The default is none.
```

```
ipv6-address-space-include-subnet
Specifies a list of IPv6 addresses or address/mask pairs describing the target LAN. When using split tunneling, only the traffic to these addresses and network segments goes through the tunnel configured for Network Access. You can add multiple address spaces to the list. For each address space, type the IPv6 address and network mask. The default is none.
```

```
address-space-local-subnets-excluded
Specifies whether to exclude local access to any host or subnet in routes that you have specified in the client routing table. The default is false. When you set this option to true, the system does not support integrated IP filtering.
```

```
address-space-loc-dns-servers-excluded
Specifies whether to exclude local access to DNS servers configured on client prior to establishing network access connection. The default is false.
```

```
address-space-protect
Specifies whether the IP address spaces whose traffic is forced through the tunnel are protected. The default is false.
```

```
app-service
The default is none.
```

```
application-launch
Specifies the applications to launch when the client accesses the network. The default is none.
```

application-launch-warning
Specifies whether the user is warned that an application is being launched. The default is true.

auto-launch
Specifies whether NA resource is to be launched automatically from full webtop. The default is false.

client-interface-speed
Specifies the baud rate of the client interface with the network. The default is 10000000.

client-ip-filter-engine
Specifies whether the client IP address is filtered. The default is .

client-power-management
Specifies how to interact with Windows power management features.

prevent
Prevents Windows from entering standby/hibernate during connection.

terminate
Terminate network access connection if Windows is entering standby/hibernate

ignore
Do nothing. Ignore power management events. This is the default value.

client-proxy
Specifies whether this resource handles a client proxy. The default is false.

client-proxy-address
Specifies the IP address of the proxy client. The default is any6.

client-proxy-enforce-subnets
Specifies whether address space subnets must be enforced in proxy auto-configuration. The default is true.

client-proxy-exclusion-list
Specifies the Web addresses that do not need to be accessed through your proxy server. You can use wild cards to match domain and host names or addresses, for example, www*.com, 128.*, 240.8, 8., mygroup.*, and *.*. The default is none.

client-proxy-ignore-auto-config-error
Allow client to connect even after an error in merging or downloading a proxy auto-configuration file. The default is false.

client-proxy-local-bypass
Specifies whether you want to allow local (intranet) addresses to bypass the proxy server. The default is false.

client-proxy-port
Specifies the port number of the proxy server you want Network Access clients to use to connect to the Internet. The default is 0 (zero).

client-proxy-script
Specifies the URL for a proxy auto-configuration script, if one is used with this connection. The default is none.

client-proxy-use-http-pac
Specifies whether the browser uses http:// to locate the proxy the autoconfig file, instead of file://. Set this to true for applications, like Citrix MetaFrame, that cannot use the client proxy autoconfig script when the browser attempts to use the prefix file:// to locate the script. The default is false.

client-proxy-use-local-proxy
Specifies whether the browser uses the proxy configured on client prior to establishing network access connection. The default is false.

client-traffic-classifier
Specifies a client traffic classifier to use with this network access connection. The default is none.

compression
Specifies whether you want to compress all traffic between the Network Access client and the controller. The default is none.

customization-group
Specifies the customization group that defines the policies that apply to network access. This option is required.

description
Specifies a unique description of the network access configuration object. The default is none.

dns-primary
For split tunneling, specifies the IPv4 address of the primary name server that is conveyed to the remote access point for IPv4 traffic. The default is any6.

ipv6-dns-primary
For split tunneling, specifies the IPv6 address of the primary name server that is conveyed to the remote access point for IPv6 traffic. The default is any6.

dns-secondary

For split tunneling, specifies the IPv4 address of the secondary name server that is conveyed to the remote access point for IPv4 traffic. The default is any6.

ipv6-dns-secondary

For split tunneling, specifies the IPv6 address of the secondary name server that is conveyed to the remote access point for IPv6 traffic. The default is any6.

dns-suffix

Type in a DNS suffix to send to the client. If this field is left blank, the controller sends its own DNS suffix. You can specify multiple default domain suffixes separated with commas. The default is none.

drive-mapping

For split tunneling, specifies the drive to which this resource provides a network access connection. The default is none.

dtls Specifies whether the network access connection uses Datagram Transport Level Security (DTLS). DTLS uses UDP instead of TCP, to provides better throughput for high demand applications like VoIP or streaming video, especially with lossy connections. The default is false.

dtls-port

Specifies the port number that the network access resource uses for secure UDP traffic with DTLS. The default is 4433.

execute-logoff-scripts

Specifies whether the system to executes logoff scripts (configured on the Active Directory domain) when the connection is terminated. The default is false.

idle-timeout-threshold

Defines the average byte rate that either ingress or egress tunnel traffic must exceed for the tunnel to update a session. If the average byte rate falls below the specified threshold, the system applies the inactivity timeout, which is defined in the session's Access Profile. The default is 0 (zero).

idle-timeout-window

Defines the value that the system uses to calculate the Exponential Moving Average (EMA) byte rate of ingress and egress tunnel traffic. The default is 0 (zero).

leasepool-name

Specifies the IPv4 lease pools that the user can access with this network access connection. The default is none.

ipv6-leasepool-name

Specifies the IPv6 lease pools that the user can access with this network access connection. The default is none.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

microsoft-network-client

Specifies whether the client PC can access remote resources over a VPN connection. The default is true.

microsoft-network-server

Specifies whether the server can access remote resources over a VPN connection. The default is false.

network-tunnel

Enables or disables the network tunnel. The default is enabled.

optimized-app

Specifies the optimized applications that you want to users to access using this network access connection resource. You can add, delete, modify, or replace the current optimized applications. The default is none.

partition

Displays the partition within which this network access connection component resides. The default is Common.

provide-client-cert

Specifies whether client certificates are required to establish an SSL connection. You can set this option to false if the client certificates are only requested in an SSL connection. In this case, the client is configured to not send client certificates. The default is true.

proxy-arp

Select Enable to enable Proxy ARP for this network access resource. When you implement Proxy ARP for a network access resource, remote VPN tunnel clients can use IP addresses from the LAN IP subnet without additional network infrastructure changes. Ranges of IP addresses from the LAN subnet can be configured in the lease pools and assigned to tunnel clients. When a host on the LAN sends traffic to a tunnel client, an ARP query is sent to request the client address. Access Policy Manager then responds with its own MAC address. Traffic is then sent to network access and forwarded to the client over the network access tunnel. No configuration changes are required on devices other than the Access Policy Manager.

See your Network Access documentation for more information about Proxy ARP configuration. The default is false.

split-tunneling

Specifies whether only traffic targeted to a specified address space is sent over the network access tunnel. With split tunneling, all other traffic bypasses the tunnel. The default is false. When you set this option to true, all traffic passing over the network access connection uses this setting.

static-host

Specifies the static hosts to which this resource provides a network access connection. The default is none.

supported-ip-version

Specifies the supported IP protocol version. The default is ipv4.

sync-with-active-directory

Specifies whether you want the network access connection to emulate the Windows logon process for a client on an Active Directory domain. The default is false.

When this option is set to true, network policies are synchronized when the connection is established, or at logoff. The following items are synchronized:

- o Logon scripts are started as specified in the user profile.
- o Drives are mapped as specified in the user profile.
- o Group policies are synchronized as specified in the user profile. Group Policy logon scripts are started when the connection is established, and Group Policy logoff scripts are run when the network access connection is stopped.

type Specifies the type of network access connection this component provides. The default is network-access.

wins-primary

Specifies the primary IP address to which this resource provides a network access connection. The default is any6.

wins-secondary

Specifies the secondary IP address to which this resource provides a network access connection. The default is any6.

```

DESCRIPTION

You can use the portal-access component to specify a portal access resource.

EXAMPLES

```
item create portal-access myportalaccess acl-order 14 patching-
type full-patch items add { item1 { host www.mywebsite.com paths
/* }}
```

Creates a portal access resource named myportalaccess.

```
item delete portal-access myportalaccess
```

Deletes the portal access resource named myportalaccess.

OPTIONS

acl-order

Specifies the order of this portal access in Access Policy Manager ACL lists. This option is required.

application-uri app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

css-patching

Specifies whether the response content type CSS is patched. The default is true.

customization-group

The customization group is created automatically if not specified.

description

Specifies a description of the resource. The default is none.

flash-patching

Specifies whether the system patches Flash content. The default is true.

host-replace-string

Specifies the replacement host string, when you specify minimal for the patching-type option.

host-search-strings

Specifies the host string to replace, when you specify minimal for the patching-type option.

html-patching

Specifies whether the system patches HTML content. The default is true.

items

Configures the host name or IP address, the network mask (if the resource is a network), the port, and any paths specified for a portal access resource. The default is none.

javascript-patching

Specifies whether the system patches JavaScript content. The default is true.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies a unique name for the component.

patching-type
Specifies whether this resource provides minimal or full path patching.

path-match-case
Specifies whether the application URI is case-sensitive. The default is true.

proxy-host
Specifies the proxy host that the portal access uses. The default is none. If you configure this option, you must also configure the option proxy-port.

proxy-port
Specifies the port that the portal access proxy uses. The default is none. Configure this option, only when you configure the option proxy-host.

publish-on-webtop
Specifies whether to publish this resource on the webtop. The default is false. If you set this option to true, you must also specify the Application URI using the application-uri option.

scheme-patching
Specifies whether this resource replaces all HTTP scheme addresses with HTTPS scheme addresses. This option is effective only when minimal patching is selected for patching-type. The default is false.

apm resource remote-desktop citrix-client-bundle

NAME
citrix-client-bundle - Configures a Citrix Client Bundle remote desktop resource configuration object.

MODULE
apm resource remote-desktop

SYNTAX
Configure the citrix-client-bundle component within the resource remote desktop module using the syntax shown in the following sections.

CREATE/MODIFY

```
create citrix-client-bundle [name]
modify citrix-client-bundle [name]
```

options:

```
app-service [[string] | none]
download-url [[url] | none]
packages [[string] | none]
windows-download-url [[url] | none]
windows-min-version [[string] | none]
windows-package [[string] | none]
sb-windows-package [[string] | none]
```

```
edit citrix-client-bundle [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list citrix-client-bundle
list citrix-client-bundle [ [name] | [glob] | [regex] ] ... ]
show running-config citrix-client-bundle
show running-config citrix-client-bundle [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
one-line
partition
```

```
show citrix-client-bundle
show citrix-client-bundle [name]
```

DELETE

```
delete citrix-client-bundle [name]
```

DESCRIPTION

You can use the `citrix-client-bundle` component to configure a Citrix Client Bundle remote desktop resource.

EXAMPLES

```
create citrix-client_bundle myccb { windows-min-version xp }
```

Creates a Citrix Client Bundle remote desktop resource named `myccb` that can be downloaded from `receiver.citrix.com` (the default value), where the client must have at least Windows XP installed.

OPTIONS

`app-service`

Specifies the name of the application service to which the object belongs. The default value is `none`. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`download-url`

Specifies the default location `receiver.citrix.com` from which to download the Citrix installation package.

`packages`

This option is deprecated and is maintained here for backward compatibility reasons.

`[name]`

Specifies an object name. This option is required; however, the parameter name is implicit and must not be typed in the syntax.

`windows-download-url`

Specifies the location from which to download the Windows version. You can provide a value for either the `windows-download-url` or `windows-package` option, but not both. The default is `none`.

`windows-min-version`

Specifies the oldest version of the Citrix client that can be used with this remote desktop resource. The default is `none`.

`windows-package`

This option is deprecated and is replaced by `sb-windows-package` and is maintained here for backward compatibility reasons.

`sb-windows-package`

Specifies the location of the Citrix Receiver client or Citrix HTML5 package to be uploaded. You can provide a value for either the `sb-windows-package` or `windows-download-url` option, but not for both. The default is `none`. The package can be uploaded via BIG-IP TMUI or can be assigned with TMSH. Follow the below mentioned steps to assign package to `sb-windows-package`.

Configure the component of the sandbox, `citrix-client-package`, within the resource module under `apm` using the syntax shown in the following sections.

MODIFY

```
modify sandbox citrix-client-package
options
  base-uri [string]
  description [[string] | none]
  files [add | delete | modify | replace-all-with] {
    [item name] {
content-type [string]
filename [string]
file-type citrix-bundle
folder [string]
local-path [string]
name [string] } } }
```

DISPLAY

```
list sandbox
list sandbox [ [ [name] | [glob] | [regex] ] ... ]
  all-properties
  non-default-properties
  one-line
  partition
```

A sandbox is a container for files stored on the BIG-IP, to which you want to provide client access. The `local-path` indicates the location of the file on the BIG-IP to be added into the sandbox e.g. `/shared/tmp/FILENAME`. Once the item is created on modifying `citrix-client-package sandbox`, it can be referenced as `citrix-client-package:[item name]` while assigning it to `sb-windows-package`.

apm resource remote-desktop citrix-client-package-file

NAME

citrix-client-package-file - Configures a Citrix client package file configuration object.

MODULE

apm resource remote-desktop

SYNTAX

Configure the citrix-client-package-file component within the resource remote desktop module using the syntax shown in the following sections.

CREATE/MODIFY

```
create citrix-client-package-file [name]
```

```
modify citrix-client-package-file [name]
```

options:

```
  app-service [[string] | none]
```

```
  location-specific [true | false]
```

```
  original-file-name [[string] | none]
```

```
  source-path [[string] | none]
```

```
edit citrix-client-package-file [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
  all-properties
```

```
  non-default-properties
```

DISPLAY

```
list citrix-client-package-file
```

```
list citrix-client-package-file [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config citrix-client-package-file
```

```
show running-config citrix-client-package-file [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
  all-properties
```

```
  non-default-properties
```

```
  one-line
```

```
  partition
```

DELETE

```
delete citrix-client-package-file [name]
```

DESCRIPTION

You can use the citrix-client-package-file component to configure access to a Citrix client package file.

EXAMPLES

```
create citrix-client-package myccpackage { source-path
```

```
  www.siterequest.citrix_download.com }
```

Creates a Citrix client package remote desktop resource named

myccpackage that is available from

www.siterequest.citrix_download.com.

OPTIONS

[name]

Specifies an object name. This option is required; however, the parameter name is implicit and must not be typed in the syntax.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

original-file-name

Specifies the original file name of the Citrix Installation package file name to download. The default is none.

source-path

Specifies the location from which to download the Citrix client package file. This option is required.

 pool [pool name]
 host [fqdn]
 ip [ip address]
 location-specific [true | false]
 password-source [session.logon.last.password | none]
 port [[string] | none]
 username-source [session.logon.last.username | none]
 edit citrix [[[name] | [glob] | [regex]] ...]
 options:
 all-properties
 non-default-properties
DISPLAY
 list citrix
 list citrix [[[name] | [glob] | [regex]] ...]
 show running-config citrix
 show running-config citrix [[[name] | [glob] | [regex]] ...]
 options:
 all-properties
 non-default-properties
 show citrix
 show citrix [name]
DELETE
 delete citrix [name]

DESCRIPTION
 You can use the B component to configure a Citrix remote desktop resource.

EXAMPLES

```
create citrix mycitrix { ip 172.29.67.130 }
Creates a Citrix remote desktop resource named mycitrix with
Citrix XML Broker server specified as IP address 172.29.67.130.

create citrix mycitrix { host mycitrix.mycompany.com auto-logon enabled
}
Creates a Citrix resource with Citrix XML Broker server specified
as hostname mycitrix.mycompany.com and auto-logon enabled with APM
credentials (that user types on Logon Page).

create citrix mycitrix { pool /Common/mycitrix-pool enable-serverside-
ssl enabled }
Creates a Citrix resource with Citrix XML Broker server(s)
specified in pool named /Common/mycitrix-pool and SSL
communication enabled to the server(s) (SSL should also be enabled
on the servers and APM virtual should have serverssl profile).
```

OPTIONS

app-service
 Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auto-logon
 Enables or disables automatic log on to the Citrix server. If you enable this option, you must also provide values for the username-

source, password-source, and domain-source options. The default is disabled.

customization-group

Specifies whether customization groups are applied to the Citrix remote desktop. You can add, modify, or delete customization groups. You can also replace all current customization groups with new customization groups. The default is none.

description

Specifies a description for your Citrix remote desktop. The default is none.

domain-source

Specifies the Session variable used as a source for the auto-logon user password. The default is session.logon.last.domain.

enable-serverside-ssl

Enables or disables SSL capabilities between the BIG-IP system and the Citrix server. When enabled, the port number automatically changes to 443. The default is disabled.

pool Specifies the pool name that contains your Citrix XML Broker server(s). You must use one of these options to specify the server address: pool, host, or ip.

host Specifies the hostname of your Citrix XML Broker server. You must use one of these options to specify the server address: pool, host, or ip.

ip Specifies the IP address of your Citrix XML Broker server. You must use one of these options to specify the server address: pool, host, or ip.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies an object name. This option is required; however, the parameter name is implicit and must not be typed in the syntax.

password-source

Specifies the session variable that is used as a source for the auto-logon password. The default is session.logon.last.password.

port Specifies the port for your Citrix server. The default is 80.

username-source

Specifies the session variable that is used as a source for the auto-logon user name. The default is session.logon.last.username.

apm resource remote-desktop quest

NAME

quest - Configures a Quest vWorkspace remote desktop resource configuration object.

MODULE

apm resource remote-desktop

SYNTAX

Configure the quest component within the resource remote desktop module using the syntax shown in the following sections.

CREATE/MODIFY

create quest [name]
modify quest [name]

options:

app-service [[string] | none]
auto-logon [enabled | disabled]

```

    customization-group [add | delete | modify | replace-all-with] {
        [name] {
options:
    caption [[string] | none]
    detailed-description [[string] | none]
        }
    }
    description [[string] | none]
    domain-source [session.logon.last.domain | none]
    enable-serverside-ssl [enabled | disabled]
    pool [pool name]
    host [fqdn]
    ip [ip address]
    location-specific [true | false]
    password-source [session.logon.last.password | none]
    port [[string] | none]
    username-source [session.logon.last.username | none]

edit quest [ [ [name] | [glob] | [regex] ] ... ]
options:
    all-properties
    non-default-properties

DISPLAY
list quest
list quest [ [ [name] | [glob] | [regex] ] ... ]
show running-config quest
show running-config quest [ [ [name] | [glob] | [regex] ] ... ]
options:
    all-properties
    non-default-properties

show quest
show quest [name]

DELETE
delete quest [name]

```

DESCRIPTION
You can use the B component to configure a Quest vWorkspace remote desktop resource.

EXAMPLES

```

create quest myquest { ip 172.29.67.130 }
Creates a Quest vWorkspace remote desktop resource named myquest
with the Quest vWorkspace connection broker server specified as IP
address 172.29.67.130.

create quest myquest { host myquest.mycompany.com auto-logon enabled }
Creates a Quest vWorkspace resource with the Quest vWorkspace
connection broker server specified as hostname
myquest.mycompany.com and with auto-logon enabled using the
credentials that the user types into the access policy Logon Page.

create quest myquest { pool /Common/myquest-pool enable-serverside-ssl
enabled }
Creates a Quest vWorkspace resource with the Quest vWorkspace
connection broker servers specified in a pool named
/Common/myquest-pool and with SSL communication enabled to the
servers. Note: SSL should also be enabled on the servers
themselves and the APM virtual server should specify a server SSL
profile.

```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auto-logon
Enables or disables automatic log on to the Quest vWorkspace connection broker server. If you enable this option, you must also provide values for the username-source, password-source, and domain-source options. The default is disabled.

customization-group
Specifies whether customization groups are applied to the Quest vWorkspace resource. You can add, modify, or delete customization groups. You can also replace all current customization groups with new customization groups. The default is none.

description
Specifies a description for your Quest vWorkspace remote desktop. The default is none.

domain-source
Specifies the session variable to use as a source for the auto-logon user password. The default is session.logon.last.domain.

enable-serverside-ssl
Enables or disables SSL capabilities between the BIG-IP system and the Quest vWorkspace connection broker server. When enabled, the port number automatically changes to 443. The default is disabled.

pool Specifies the pool name that contains your Quest vWorkspace connection broker servers. (You must specify the server address using one of these options: pool, host, or ip.)

host Specifies the hostname of your Quest vWorkspace connection broker server. (You must specify the server address using one of these options: pool, host, or ip.)

ip Specifies the IP address of your Quest vWorkspace connection

broker server. (You must specify the server address using one of these options: pool, host, or ip.)

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies an object name. This option is required. Note: The parameter name is implicit. Do not type name in the syntax.

password-source

Specifies the session variable to use as a source for the auto-logon password. The default is session.logon.last.password.

port Specifies the port for your Quest vWorkspace connection broker server. The default is 8080.

username-source

Specifies the session variable to use as a source for the auto-logon user name. The default is session.logon.last.username.

apm resource remote-desktop rdp

NAME

rdp - Configures a Microsoft Remote Desktop Protocol (MSRDP) configuration object.

MODULE

apm resource remote-desktop

SYNTAX

Configure the rdp component within the resource remote desktop module using the syntax shown in the following sections.

CREATE/MODIFY

```
create rdp [name]
modify rdp [name]
options:
  acl-order [[integer] | none]
  application [[string] | none]
  app-service [[string] | none]
  auto-logon [enabled | disabled]
  color-depth [4 | 8 | 16 | 24]
  customization-group [add | delete | modify | replace-all-with] {

```

options:

```
all-properties
non-default-properties
```

```
show rdp
```

```
show rdp [name]
```

DELETE

```
delete rdp [name]
```

DESCRIPTION

You can use the rdp component to configure an MSRDP resource.

EXAMPLES

```
create rdp myrdp { host 172.29.67.130 }
```

Creates a MSRDP remote desktop resource named myrdp with an MSRDP server with an IP address of 172.29.67.130.

```
create rdp myrdp { host 172.29.67.130 rdp-cache-bitmaps true }
```

Creates a MSRDP remote desktop resource named myrdp with an MSRDP server with an IP address of 172.29.67.130 where bitmaps are cached on the client PC.

OPTIONS

acl-order

Specifies the order in which you want the RDP server to appear in the ACL Order list. The default is 0 (zero).

application

Specifies the executable name of the application, for example notepad.exe. You can include the full path to the application, for example "C:\my\mybinary.exe".

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auto-logon

Specifies if automatic log on to the Microsoft RDP server is used. If you enable this option, you must also provide values for the username-source, password-source, and domain-source options. The default is disabled.

color-depth

Specifies the requested remote session color depth. The default is 32. The options are:

24-bit

16-bit

8-bit

4-bit

customization-group

Specifies whether customization-groups are applied to the remote desktop. You can add, modify, delete, or replace all customization-groups. The default is none.

description

Specifies a description of an MSRDP resource. The default is none.

domain-source

Specifies the session variable used as a source for the auto-logon user password. The default is session.logon.last.domain.

host Specifies the hostname of your Microsoft RDP server. Either the host or ip option is required; however, you cannot specify both options.

ip Specifies the IP address of your Microsoft RDP server. Either the host or ip option is required; however, you cannot specify both options.

java-client

Specifies whether to use Java RDP client to launch this resource. The default is disabled.

native-client

Specifies whether to use native RDP client to launch this resource. The default is disabled. java-client and native-client can't be enabled at the same time. When both java-client and native-client are disabled, RDP resource is launched using ActiveX control.

location-specific

Specifies whether or not this object contains one or more

attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

log Specifies the log format. The default is none. The options are:

config
none The system does not log packets sent to and from the Microsoft RDP server.

packet
The system logs packets sent to and from the Microsoft DP server.

summary
The system provides a short summary of the communications between the BIG-IP system and the Microsoft RDP server.

verbose
The system provides an extensive summary of the communications between the BIG-IP system and the Microsoft RDP server.

[name]
Specifies an object name. This option is required; however, the parameter name is implicit and must not be typed in the syntax.

password-source
Specifies the session variable used as a source for the auto-logon password. The default is session.logon.last.password.

port Specify port 3389 for your Microsoft RDP server. The default is 0 (zero).

rdp-cache-bitmaps
Specifies whether to cache bitmap files on the client. The default is true.

rdp-show-contents-while-dragging
Specifies whether to show the contents of a window when the user is dragging the window. The default is false.

rdp-show-desktop-wallpaper
Specifies whether to display the desktop background. The default is false.

rdp-show-themes
Specifies whether to display the desktop theme. The default is false.

rdp-window-animations
Specifies whether to display Window animations. The default is false.

redirect-com-ports
Specifies whether to connect to your communication ports. The default is false.

redirect-drives
Specifies whether to connect to your local drives. The default is false.

redirect-keyboard-commands
Specifies when to redirect keyboard commands to a remote session. When enabled, commands such as Alt-tab and Ctrl-Alt-Del are available in remote sessions. The default is in-full-screen. The options are:

enable
The keyboard commands for the remote desktop are available to the user.

disable
The keyboard commands for the remote desktop are not available to the user.

in-full-screen
The keyboard commands for the remote desktop are available to the user only when the value of the window-size option is full-screen.

redirect-printers
Enables or disables connection to a local printer. The default is disabled.

redirect-sound
Enables or disables sounds playing in a remote session. The default is disabled.

username-source
Specifies the session variable used as a source for the auto-logon user name. The default is session.logon.last.username.

window-height
Specifies the height, in pixels, of the remote desktop window. Set this option only when you set the value of the window-size option to custom. The default is 600 pixels.

window-percent-of-desktop
Specifies the width and height of the remote session window as a percentage of the user's desktop.

window-size
Specifies the type of window sizing to use on the client desktop.
The default is custom-size.

The options are:

full-screen
The remote desktop window fills the entire screen.

percent-of-desktop
The value you configure represents a percentage of the screen that the remote desktop fills.

custom
When you use this option, you must also set the window-height and window-width options.

seamless
window-width
Specifies the width, in pixels, of the remote desktop window. The default is 800 pixels.

workdir
Specifies the directory you want the user to access on the target server. The default is none.

apm resource remote-desktop vmware-view

NAME

vmware-view - Configures a VMware View remote desktop resource configuration object.

MODULE

apm resource remote-desktop

SYNTAX

Configure the vmware-view component within the resource remote desktop module using the syntax shown in the following sections.

CREATE/MODIFY

```
create vmware-view [name]
modify vmware-view [name]
options:
  app-service [[string] | none]
  auto-logon [enabled | disabled]
  customization-group [add | delete | modify | replace-all-with] {
    [name] {
options:
  caption [[string] | none]
  detailed-description [[string] | none]
    }
  }
  description [[string] | none]
  domain-source [session.logon.last.domain | none]
  enable-serverside-ssl [enabled | disabled]
  pool [pool name]
  host [fqdn]
  ip [ip address]
  location-specific [true | false]
  password-source [session.logon.last.password | none]
  port [[string] | none]
  username-source [session.logon.last.username | none]
```

```
edit vmware-view [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list vmware-view
list vmware-view [ [ [name] | [glob] | [regex] ] ... ]
show running-config vmware-view
show running-config vmware-view [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

non-default-properties

```
show vmware-view
show vmware-view [name]
```

```
DELETE
delete vmware-view [name]
```

DESCRIPTION

You can use the B component to configure a VMware View remote desktop resource.

EXAMPLES

```
create vmware-view myview { ip 172.29.67.130 }
Creates a VMware View remote desktop resource named myview with
the VMware View Connection server specified as IP address
172.29.67.130.
```

```
create vmware-view myview { host myview.mycompany.com auto-logon
enabled }
```

Creates a VMware View resource with the VMware View Connection server specified as hostname myview.mycompany.com and auto-logon enabled with APM credentials (that user types on Logon Page).

```
create vmware-view mview { pool /Common/myview-pool enable-serverside-
ssl enabled }
```

Creates a VMware View resource with the VMware View Connection server(s) specified in pool named /Common/myview-pool and SSL communication enabled to the server(s) (SSL should also be enabled on the servers and APM virtual should have serverssl profile).

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

auto-logon

Enables or disables automatic log on to the VMware View Connection Server server. If you enable this option, you must also provide values for the username-source, password-source, and domain-source options. The default is disabled.

customization-group

Specifies whether customization groups are applied to the VMware View resource. You can add, modify, or delete customization groups. You can also replace all current customization groups with new customization groups. The default is none.

description

Specifies a description for your VMware View remote desktop. The default is none.

domain-source

Specifies the Session variable used as a source for the auto-logon user password. The default is session.logon.last.domain.

enable-serverside-ssl

Enables or disables SSL capabilities between the BIG-IP system and the VMware View Connection server. When enabled, the port number automatically changes to 443. The default is disabled.

pool Specifies the pool name that contains your VMware View Connection server(s). You must use one of these options to specify the server address: pool, host, or ip.

host Specifies the hostname of your VMware View Connection server. You must use one of these options to specify the server address: pool, host, or ip.

ip Specifies the IP address of your VMware View Connection server. You must use one of these options to specify the server address: pool, host, or ip.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies an object name. This option is required; however, the parameter name is implicit and must not be typed in the syntax.

password-source

Specifies the session variable that is used as a source for the auto-logon password. The default is session.logon.last.password.

port Specifies the port for your VMware View Connection server. The default is 80.

username-source

Specifies the session variable that is used as a source for the auto-logon user name. The default is session.logon.last.username.

apm resource sandbox

NAME
sandbox - Configures a sandbox.

MODULE
apm resource

SYNTAX
Configure the sandbox component within the resource module using the syntax shown in the following sections.

CREATE
The CREATE command is currently not available. However, a number of sandboxes have already been created. Use these to upload files.

MODIFY
modify sandbox [name]
options
base-uri [string]
description [[string] | none]
files [add | delete | modify | replace-all-with] {
[item name] {
content-type [string]
filename [string]
file-type [citrix-bundle | customization | unknown]
folder [string]
local-path [string]
name [string]
}
}
}

DISPLAY
list sandbox
list sandbox [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DESCRIPTION
Configures a sandbox and its files. A sandbox is a container for files stored on the BIG-IP, to which you want to provide client access.

EXAMPLES
modify sandbox hosted-content files add { BIGIPEdgeClient.exe { folder /client local-path /tmp/BIGIPEdgeClient.exe } }

Adds a file called BIGIPEdgeClient.exe to sandbox named hosted-content. The virtual path to this file consists of the sandbox's base-uri, the file's folder, and the name of the file. Putting these components together, the virtual path for the uploaded file is /public/share/client/BIGIPEdgeClient.exe, where /public/share is the base-uri, /client is the folder, and BIGIPEdgeClient.exe is the filename. The local-path indicates the location of the file on the disk drive to be added into the sandbox.

Note: The file you add must already be on the BIG-IP system.

OPTIONS
base-uri
Specifies the first component of the virtual path to the sandbox file. The base-uri for sandbox "hosted-content" is /public/share. The virtual path to a sandbox box file is made up of three components: base-uri/folder/filename

All files in a sandbox share the same base-uri, but the folder can be different for each file.

description
Specifies a unique description about the sandbox.

files
Specifies the list of files in the sandbox.

item name
Specifies the name of an item in the list of files. You can use the original filename as the item name. Each item name in a sandbox must be unique.

content-type

Specifies the content-type field in a HTTP header such as "image/gif" or "text/plain". If none is provided, tmsh will try its best to provide this value.

filename

Specifies the last component of the virtual path to the sandbox file. We recommend that you use the filename of the original file for this name.

file-type

Specifies the F5 file type. Currently there are only three types: unknown, citrix-bundle, and customization. No value is required if a file is uploaded to sandbox for "citrix-client-bundle", since this sandbox is the repositories for F5 specific type of file. However, for files uploaded to sandbox "hosted-content" if no value is provided, the file type defaults to "unknown".

folder

Specifies the second component of the virtual path to the sandbox file.

local-path

Specifies the location of the file to be inserted into the sandbox. This file must be on the BIG-IP already.

name Specifies a value for the underlying file object. Use this only if you are trying to add more than one sandbox file in a modify command. Otherwise, don't specify a value for this attribute. The value must be specified as follows: full path of sandbox name:item name. For example, if the sandbox name is '/Common/hosted-content' and the item name is 'index.html', the value should be '/Common/hosted-content:index.html'.

apm resource webtop-link

NAME

webtop-link - Configures a webtop link resource.

MODULE

apm resource

SYNTAX

Configure the webtop-link component within the resource module using the syntax shown in the following sections.

CREATE/MODIFY

create webtop-link [name]

modify webtop-link [name]

options:

application-uri [string]

app-service [[string] | none]

customization-group [string]

description [[string] | none]

location-specific [true | false]

edit webtop-link [[[name] | [glob] | [regex]] ...]

options:

all

DISPLAY

list webtop-link

list webtop-link [[[name] | [glob] | [regex]] ...]

show running-config webtop-link

show running-config webtop-link [[[name] | [glob] | [regex]] ...]

options:

all-properties

non-default-properties

one-line

show webtop-link

show webtop-link [name]

DELETE

delete webtop-link [name]

DESCRIPTION

Configures the settings necessary to define a link to a webtop that is displayed to the end-user as part of the access policy execution.

EXAMPLES

```
create webtop-link mywebtoplinkcgl application-uri
"http://www.externalsite.com/"
Creates a webtop named mywebtoplinkcgl with the application-uri of
http://www.externalsite.com/.
```

OPTIONS

application-uri
Specifies the application URI of the external portal to which this resource provides access for this webtop link. This is a required setting.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group
Specifies the customization settings for the webtop.

Note: You must create a customization group of type webtop before you can create a webtop resource. If you do not specify a customization group, a group will be created automatically.

description
Specifies a description of the resource. The default is none.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

BIG-IP 2012-10-24 apm resource webtop-link(1)

apm resource webtop

NAME
webtop - Configures a webtop resource.

MODULE
apm resource

SYNTAX
Configure the webtop component within the resource module using the syntax shown in the following sections.

```
CREATE/MODIFY
create webtop [name]
modify webtop [name]
options:
  app-service [[string] | none]
  customization-group [string]
  description [[string] | none]
  location-specific [true | false]
  minimize-to-tray [false | true]
  portal-access-start-uri [[string] | none]
  webtop-type [full | last | network-access | portal-access]
  warn-when-closed [false | true]
```

```
edit webtop [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list webtop
list webtop [ [ [name] | [glob] | [regex] ] ... ]
show running-config webtop
show running-config webtop [ [ [name] | [glob] | [regex] ] ... ]
options:
```

all-properties
non-default-properties
one-line

show webtop
show webtop [name]

DELETE
delete webtop [name]

DESCRIPTION

Configures the settings necessary to define the webtop assigned to the end-user as part of the access policy execution.

EXAMPLES

```
create webtop mynawebtop { customization-group mywebtopcgl minimize-to-tray false }
```

Creates a webtop named mynawebtop with the customization group mywebtopcgl and the network access minimize-to-tray option set to false.

```
create webtop mywawebtop { customization-group mywebtopcgl portal-access-start-uri "http://www.siterequest.com" }
```

Creates a webtop named mywawebtop with the customization group mywebtopcgl and the starting URI for the portal access of http://www.siterequest.com.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

customization-group

Specifies the customization settings for the webtop.

Note: You must create a customization group of type webtop before you can create a webtop resource. This option is required.

description

Specifies a description of the resource. The default is none.

portal-access-start-uri

Specifies the URI that the webtop starts. You can only configure this option if you have configured the webtop-type option for portal-access.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

minimize-to-tray

Specifies whether the network access window (launched from the full webtop) is minimized to the system tray automatically after the network access connection starts. The default is true.

You can configure this option only if you configured the webtop-type option as network-access or full. With a network access webtop, the webtop automatically minimizes to the tray. With a full webtop, the webtop minimizes to the system tray only after the network access connection is started.

warn-when-closed

Specifies whether the network access window (launched from the full webtop) should display a warning message when the webtop closes.

You can configure this option only if you configured the webtop-type option as full.

webtop-type

Specifies the type of webtop this resource creates. The options are:

full A webtop to which you assign a single network access resource, multiple portal access resources, and multiple application access app tunnel resources, or any combination of the three types. This is the default.

last

network-access
A webtop to which you assign only a single network access resource.

portal-access

A webtop to which you assign only portal access resources.

apm saml artifact-resolution-service

NAME
artifact-resolution-service - Specify service used to resolve SAML artifacts

MODULE
apm saml

SYNTAX
Configure the artifact-resolution-service component within the saml module using the syntax shown in the following sections.

CREATE/MODIFY
create artifact-resolution-service [name]
modify artifact-resolution-service [name]
options:
 app-service [[string] | none]
 artifact-resolution-service-host [[string] | none]
 artifact-resolution-service-port [integer]
 artifact-send-method [http-post | http-redirect]
 artifact-validity [integer]
 basic-auth-password [[string] | none]
 basic-auth-username [[string] | none]
 description [[string] | none]
 location-specific [true | false]
 virtual-server-name [name]
 want-artifact-resolution-rq-signed [true | false]

edit artifact-resolution-service [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list artifact-resolution-service
list artifact-resolution-service [[[name] | [glob] | [regex]] ...]
show running-config artifact-resolution-service
show running-config artifact-resolution-service [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 app-service
 non-default-properties
 one-line
 partition

DELETE
delete artifact-resolution-service [name]

DESCRIPTION
You can use the artifact-resolution-service to create and manage artifact resolution services.

EXAMPLES
create artifact-resolution-service my_ars {virtual-server-name my_virt}
Creates a SAML artifact resolution service named my_ars. In this example, the virtual server my_virt will be used to receive artifact resolve requests and send artifact responses.

create artifact-resolution-service my_ars1 {virtual-server-name my_virt1 artifact-resolution-service-host bigip.mycompany.com basic-auth-username user basic-auth-password password artifact-send-method http-redirect }
Creates a SAML artifact resolution service named my_ars1. The service requires that artifact resolve requests be sent using the http-redirect method with an authorization header that contains the specified credentials.

list artifact-resolution-service
Displays a list of artifact resolution services.

delete artifact-resolution-service my_ars
Deletes the my_ars artifact resolution service.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

artifact-resolution-service-host
Specifies the hostname of the artifact resolution service.

artifact-resolution-service-port
Specifies the port that artifact resolution service will be

listening on.

artifact-send-method
Specifies method resolver will use when sending artifact resolve requests. Default value is http-redirect.

artifact-validity
Specifies in seconds how long an artifact remains valid. Default value is 60 seconds.

basic-auth-password
Specifies the basic authentication password to send with an artifact resolve request to this BIG-IP.

basic-auth-username
Specifies the basic authentication username to send with an artifact resolve request to this BIG-IP.

description
Specifies a unique description for the artifact resolution service. Default is none.

location-specific
Objects of this class might have location-specific attributes. If the object is location-specific, set to true.

virtual-server-name
Specifies the virtual server to be used by the artifact resolution service.

want-artifact-resolution-rq-signed
Specifies whether this BIG-IP requires artifact resolution requests to be signed. Default value is true.

apm saml attribute-consuming-service

NAME
attribute-consuming-service - Configure a list of SAML attribute consuming services.

MODULE
apm saml

SYNTAX
Configure the attribute-consuming-service component within the saml module using the syntax shown in the following sections.

MODIFY
create attribute-consuming-service [name]
modify attribute-consuming-service [name]
options:
 app-service [[string] | none]
 attributes [add | delete | modify | none | replace-all-with] {
 name [string] {
 app-service [[string] | none]
 attribute-name [string]
 friendly-name [string]
 is-required [bool]
 name-format [string]
 }
 }
 service-description [[string] | none]
 service-name [[string] | none]
edit attribute-consuming-service [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
DISPLAY
list attribute-consuming-service
list attribute-consuming-service [[[name] | [glob] | [regex]] ...]
show running-config attribute-consuming-service
show running-config attribute-consuming-service [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 app-service
 non-default-properties
 one-line

partition

DELETE
delete attribute-consuming-service [name]

DESCRIPTION
You can use attribute-consuming-service to create and manage SAML attribute consuming services. Each attribute consuming service contains a list of SAML attributes. Each attribute consuming service must contain at least one attribute.

EXAMPLES
create attribute-consuming-service my_attr consuming service attributes
add { my_attr { attribute-name "urn:oid:1.3.6.1.4.1.5923.1.1.1.7" is-
required false friendly-name eduPersonEntitlement name-format
"urn:oasis:names:tc:SAML:2.0:attrname-format:uri" } service-name
"Academic Journals R US" service-description "Academic Journals R US"
Creates a new attribute consuming service named
my_attr_consuming_service with one attribute named my_attr.

list attribute-consuming-service
Displays a list of attribute consuming services.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

attributes
Specifies a list of attributes. attribute-name must be unique within an attribute-consuming-service object. friendly-name is a more human-readable form of the attribute name for cases where attribute-name is complex. is-required indicates if the service requires the attribute in order to function at all. name-format is a URI reference representing the classification of the attribute name for purposes of interpreting the name.

service-description
Specifies a description for the attribute consuming service.

service-name
Specifies a unique name for the attribute consuming service.

SEE ALSO
COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2017-apmlsaml attribute-consuming-service(1)

apm saml auth-context-class-list

NAME
auth-context-class-list - Configure a list of SAML authentication context classes.

MODULE
apm saml

SYNTAX
Configure the auth-context-class-list component within the saml module using the syntax shown in the following sections.

MODIFY
create auth-context-class-list [name]
modify auth-context-class-list [name]
options:
app-service [[string] | none]
classes [add | delete | modify | none | replace-all-with] {
name [string] {
order [integer]
value [string]j
}
}
description [[string] | none]

edit auth-context-class-list [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list auth-context-class-list

```
list auth-context-class-list [ [ [name] | [glob] | [regex] ] ... ]
show running-config auth-context-class-list
show running-config auth-context-class-list [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete auth-context-class-list [name]
```

DESCRIPTION

You can use the `auth-context-class-list` to create and manage lists of SAML authentication context classes. Each class in the list must contain a unique order and a unique value. Order indicates the relative level of security ranging from 1 (least secure) to 255 (most secure).

EXAMPLES

```
create sp_authn_ctx_classes_list classes add { password { order 1 value
urn:oasis:names:tc:SAML:2.0:ac:classes:Password} kerberos { order 2
value urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos } }
```

Creates a new list named 'sp_authn_ctx_classes_list' with two authentication context classes: password and kerberos. Higher order number implies higher security associated with class. In this example, the fact that the kerberos class order is 2 implies that it has higher security than the password class with order 1.

```
modify authentication_contexts_list classes add { SmartcardPKI { order
8 value urn:oasis:names:tc:SAML:2.0:ac:classes:SmartcardPKI } }
```

Modifies default list of authentication context classes to include a class 'SmartcardPKI' with priority order '8' and value 'urn:oasis:names:tc:SAML:2.0:ac:classes:SmartcardPKI'.

```
modify authentication_contexts_list classes delete { smartcard }
Removes authentication context class 'smartcard' from the default
list of authentication context classes
'authentication_contexts_list'.
```

```
list auth-context-class-list
Displays default list of authentication context classes.
```

OPTIONS

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

classes
Specifies a list of authentication context classes. Properties 'order' and 'value' must be unique within the `auth-context-class-list` object. Property 'order' specifies the security of the class in the context of the BIG-IP system; order ranges from the least secure '1' to the most secure '255'. Property 'value' specifies a URL of authentication context class, for example, 'urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos'.

description
Specifies a unique description for the list of authentication context classes.

apm session

NAME

Session - Shows apm session information including session id and all keys and values such as client ip, user name etc

MODULE

apm

SYNTAX

Shows session information with the syntax shown in the following sections.

LIST/DELETE

Lists all the apm session information, session id and all keys and

values related to the session. This command can show all the session details or only for some sessions. Deletes all the apm sessions or some sessions at once.

LIST

```
list session [session_id] [session_id]
options:
  all
  all-properties
  save-to-file
```

DISPLAY

```
delete session [session_id] [session_id]
options:
  all
```

EXAMPLES

```
list session [all-properties] [session_id] [session_id]
```

Lists details related to the sessions or the given optional session_id.

```
delete session [all] [session_id] [session_id]
```

MODULE

apm sso

SYNTAX

Configure the basic component within the sso module using the syntax shown in the following sections.

CREATE/MODIFY

```
create basic [name]
modify basic [name]
options:
  apm-log-config [[string] | none]
  app-service [[string] | none]
  headers [add | delete | modify | | replace-all-with] {
  location-specific [true | false]
  [name] {
    options:
      app-service [[string] | none]
  hname [[URL] | none]
  hvalue [[integer] | none]
  }
}
password-source [session.sso.token.last.password | none]
username-conversion [enabled | disabled]
username-source [session.sso.token.last.username | none]
```

```
edit basic [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list basic
list basic [ [ [name] | [glob] | [regex] ] ... ]
show running-config basic
show running-config basic [ [ [name] | [glob] |
[regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show basic
show basic [name]
```

DELETE

```
delete basic [name]
```

DESCRIPTION

You can use the basic component to create, modify, display, or delete an SSO HTTP basic authentication configuration object.

EXAMPLES

```
create basic mybasic
```

Creates an SSO basic configuration object named mybasic.

OPTIONS

apm-log-config

Specifies log-setting object to associate with this sso. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

headers

Specifies the name and value of the HTTP header content to be inserted in an HTTP Request that passes through the APM SSO module. The default is none. The options are:

app-service

Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

hname

The name of the HTTP header.

hvalue

The value of the HTTP header.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies a name for the SSO configuration. This option is required.

partition

Displays the partition in which the object resides.

oam-server

Specifies the name of your Oracle Access Manager server. The default value is none.

password source

Specifies the source from which you want SSO to retrieve the password to use to authenticate applications.

username-conversion

Enables or disables conversion of PREWIN2k/UPN username input format to the format for SSO to use. The default value is disabled.

username-source

Specifies the source from which you want SSO to retrieve the username to use to authenticate applications.

apm sso form-based

NAME

form-based - Configures a single sign-on form-based configuration object.

MODULE
apm sso

SYNTAX
Configure the form-based component within the sso module using the syntax shown in the following sections.

CREATE/MODIFY

```
create form-based [name]
modify form-based [name]
options:
  apm-log-config [[string] | none]
  app-service [[string] | none]
  external-access-management [oam | none]
  form-action [[URL] | none]
  form-field [string]
  form-method [get | post]
  form-password [string]
  form-username [string]
  headers [add | delete | modify | | replace-all-with] {
    [name] {
options:
  app-service [[string] | none]
    hname [[URL] | none]
  hvalue [[integer] | none]
    }
  }
  password-source [session.sso.token.last.password | none]
  start-uri [[URLs] | none]
  success-match-type [cookie | none | url]
  success-match-value [string]
  username-source [session.sso.token.last.username | none]

edit form-based [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list form-based
list form-based [ [ [name] | [glob] | [regex] ] ... ]
show running-config form-based
show running-config form-based [ [ [name] | [glob] |
  [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show form-based
show form-based [name]
```

DELETE

```
delete form-based [name]
```

DESCRIPTION

You can use the form-based component to configure an SSO form-based configuration object.

EXAMPLES

```
create form-based fb_2011_sso { start-uri
"/fb/auth/logon.aspxurl=https://exch2011.mv1.fp.com/fp/&reason=0"
form-action "/fp/auth/fpauth.dll" form-username "username" form-
password "password" form-field "destination
https://exch2011.mv1.fp.com/fp/" }
```

Creates an SSO form-based configuration object named fb_2011_sso.

OPTIONS

apm-log-config
Specifies log-setting object to associate with this sso. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

external-access-management
form-action
Specifies the form action URL that is used for HTTP form-based authentication. This is optional. If you do not specify a form action, then Access Policy Manager uses the URI from the request to perform HTTP form-based authentication. The default is none.

form-field
Specifies the hidden form parameters that are required by the authentication server logon form at your location. The default is none. Specify a parameter name, a space, and the parameter value, if any. Multiple parameters can be configured with each "name value" pair in one line. Use edit to add multiple parameters. Please note that create and modify do not allow using new line on the terminal.

form-method
Specifies the form method to use for form-based HTTP authentication. The value is either get or post. The default is post.

If you specify get, Access Policy Manager forces the

authentication using HTTP GET rather than authenticating using form-based POST.

form-password
Specifies the parameter names used by the form that is sent the POST request.

form-username
Specifies the parameter names used by the form that is sent the POST request.

headers
Specifies the name and value of the HTTP header content to be inserted in an HTTP Request that passes through the APM SSO module. The default is none.

The options are:

app-service
Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

hname
Specifies the name of the HTTP header.

hvalue
Specifies the value of the HTTP header.

[name]
Specifies a name for the component.

password-source
Specifies the password you want cached for single sign-on.
The default is session.sso.token.last.password.

start-uri
Specifies a URL resource. For example, for FB, it would be /fb/auth/logon.aspx*. For Citrix, /Citrix/XenApp/auth/logon.aspx. This resource must respond with a challenge to a non-authenticated request.
The default is none.

success-match-type
Specifies the method your authentication server uses. If you specify a value for this option, you must also specify a value for success-match-value. The default is none. The options are:

url One or more URLs. The system supports only the wildcard character (*).

cookie
A cookie name.

success-match-value
Specifies the value used to specify either the URL(s) or cookie for the success-match-type option. The default is none.

username-source
Specify the username you want cached for single sign-on. The default is session.sso.token.last.username.

DELETE
delete form-basedv2 [name]
```

DESCRIPTION

You can use the form-basedv2 component to configure an SSO form-basedv2 configuration object. When creating a new SSO form-based v2 configuration object, you must add at least one forms item and within it at least one controls item. You must also provide a value for the request-value option in the forms item.

The SSOv2 module identifies and processes two types of application HTTP requests - logon page requests and credentials submit requests. Logon

page requests are identified using the request- set of options. Credentials submit requests, in most cases, are identified automatically. When this fails, you can set the submit-autodetect option to false and use the submit- set of options to identify these requests.

When the SSOv2 module identifies a logon page request, it scans the response trying to find the logon form. If the logon form is found, SSOv2 inserts a JavaScript code that will cause the logon form to be submitted automatically by the browser. The client must support JavaScript.

When the SSOv2 module identifies a credentials submit request, it compares POST data parameter names with form controls defined in the configuration. For a POST data parameter name that has a corresponding form control, the SSOv2 module replaces its value with the control value from the configuration. Control values are usually supplied through session variables, such as session.sso.token.last.username and session.sso.token.last.password. POST data parameters that have no corresponding controls in the configuration are not changed.

The majority of web applications have a single logon page with one logon form. You will need to define a single forms item for these applications. In rare cases when an application has multiple logon pages with different logon forms, you will need to create multiple forms items, one for each logon page/form. If multiple logon pages use the same form, you will need only one forms item with a list of URIs for all logon pages.

Every forms item must include at least one controls item, and can include up to 32 controls items. Each controls item represents an input element of an HTML logon form, such as form fields for entering username and password, and, optionally, any hidden form parameters. The name of the controls item must match the name attribute of the corresponding input tag of the form. For example, if the form has the following HTML tag for entering the username:

the forms item must include a controls item with the name Bugzilla login. The controls item used for entering the user's password must have the secure option set to true. The value of a control item should usually be the name of a session variable, starting with the percent (%) sign and enclosed in curly braces ({}); for example, the value for the username control item: `{session.sso.token.last.username}`. The value can also be a string, or a combination of strings and session variable names.

EXAMPLES

```
create form-basedv2 fbssov2-owa2010 { forms add { owa2010 { controls
add { password { secure true value %{session.sso.token.last.password\}
} username { value %\{session.sso.token.last.username\} } } request-
value /owa/auth/logon.aspx?replaceCurrent=1 submit-javascript clkLgn()
submit-javascript-type extra success-match-type cookie success-match-
value sessionid } } }
```

Creates an SSO form-basedv2 configuration object named fbssov2-owa2010.

```
delete fbssov2-owa2010
```

Deletes an SSO form-basedv2 configuration object named fbssov2-owa2010.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

forms

Specifies one or more items, each defining SSO processing of a separate application logon form.

[name]

Specifies the name of the form item. It does not have to match the actual name of the HTML form and can be arbitrary.

The options are:

app-service

Specifies the name of the application service to which the form item belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the form item. Only the application service can modify or delete the form item.

attribute-value

Specifies the value of the HTML tag attribute used to identify the logon form. The attribute could be id, name, or action, and is specified by the id-type option. For other values of the id-type option, this is not used and should be set to none.

controls

Specifies one or more form control items (up to 32) that you want to be processed by SSOv2.

[name]

Specifies the name of the HTML form control item. It must match the name attribute value of the HTML form's input tag.

The options are:

app-service

Specifies the name of the application service to which the control item belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the control item. Only the application service can modify or delete the control item.

secure

Specifies whether the control item represents the HTML input tag of type "password". The default is false.

value

Specifies the value of the control item. This is usually the name of a session variable. If the session variable is not found when the SSO request is processed, the value of the corresponding POST parameter will be empty. The value could also be a literal string or a combination of strings and session variable names.

description

User-defined description.

form-order

Specifies the order of the HTML logon form on the logon page when the id-type option is set to order. Starts with 1.

id-type

Specifies how the HTML logon form is found in the HTML body of the logon page. If there is more than one form on the logon page matching the criteria, the first match is used. The default is inputs.

The options are:

action

The logon form is identified by the value of the tag in the action attribute. The value is specified in the attribute-value option.

id The logon form is identified by the id attribute's value of the tag. The value is specified in the attribute-value option.

name The logon form is identified by the name attribute's value of the tag. The value is specified in the attribute-value option.

order

The logon form is identified by its relative order on the logon page (starting from 1). The order is specified in the form-order option.

inputs

The logon form is identified by a combination of controls items. The controls in the configuration must have corresponding elements in the form.

request-method

Specifies the HTTP method of the application's request returning logon page. Default is get.

request-name

Specifies the name of the HTTP cookie or the name of the HTTP header used to identify application's request for logon page. The cookie or header is selected by the request-type option. The value of the cookie or header is specified by the request-value option. When the request-type option is set to uri, this option is not used and should be set to none.

request-negative

When set to true, the application's request for logon page will be identified by the absence of the specified cookie or header, or by a failed match against the list of specified URIs. The default is false.

request-prefix

Specifies how the value of the request-value option will be used to match one of the HTTP request cookie, header, or URI. The default is true and specifies a partial match; false specifies an exact match.

request-type

Specifies which element of the HTTP request headers is used to identify the application's request for logon page. The default is uri.

The options are:

cookie

The request is identified by the presence (or absence) of a cookie. The name and value of the cookie are specified by the request-name and request-value options.

header

The request is identified by the presence (or absence) of the HTTP header. The name and value of the header are specified by the request-name and request-value options.

uri The request is identified by a successful (or failed) match against a list of URIs specified by the request-value option, and the request-name option is not used.

request-value

Specifies the value of the HTTP request element that must be matched to identify the request as the application's request for the logon page. This is one of: the cookie value, the header value, or a list of URIs (one per line) as specified by the request-type option. Cookie or header value could be set to none, in which case only the presence of the named cookie or header is checked and the value is not checked. When checking for URI, the value must be specified.

submit-autodetect

When set to true, the application's HTTP request that submits the user's credentials will be identified automatically and other submit- options should not be used. When false, the form submit will be identified using a combination of other submit- options. The default is true.

submit-javascript

Specifies user-provided JavaScript code to be inserted into the logon page to perform automatic form submission when the submit-javascript-type option is set to custom. The custom JavaScript code replaces the code automatically generated by the SSOv2 module. When the submit-javascript-type option is set to extra, it specifies the application's JavaScript functions to call from the automatically generated JavaScript code prior to submitting a logon form. When the submit-javascript-type option is set to auto, this option should be set to none.

submit-javascript-type

Specifies the type of JavaScript code to be inserted into the logon page by the SSOv2 module to perform automatic logon form submission.

The options are:

auto JavaScript code is automatically generated by the SSOv2 module.

custom

JavaScript code is provided by the user in the submit-javascript option.

extra

JavaScript code is automatically generated by the SSOv2 module, and additional JavaScript code provided by the user in the submit-javascript option is inserted before the form submit statement.

submit-method

Specifies the HTTP method of credentials submit request for the application. This must be set to post. This option is not used when submit-autodetect is true.

submit-name

Specifies the name of the HTTP cookie or the name of HTTP header used to identify credentials submit request for the application. The cookie or header is selected by the submit-type option. The value of the cookie or header is specified by the submit-value option. When the submit-type option is set to uri, this option is not used and should be set to none. This option is not used when submit-autodetect is true.

submit-negative

When set to true, the credentials submit request for the application is identified by the absence of a specified cookie or header, or by a failed match against the list of specified URIs. The default is false. This option is not used when submit-autodetect is true.

submit-prefix

Specifies how the value of the submit-value option will be used to match the HTTP request cookie, header, or URI. The default is true and specifies partial match; false specifies exact match. This option is not used when submit-autodetect is true.

submit-type

Specifies which element of HTTP request headers is used to identify the credentials submit request for the application. The default is uri. This option is not used when submit-autodetect is true.

The options are:

cookie

The request is identified by the presence (or absence) of a cookie. The name and value of the cookie are specified by the submit-name and submit-value options.

header

The request is identified by the presence (or absence) of the HTTP header. The name and value of the header are specified by the submit-name and submit-value options.

uri The request is identified by a successful (or failed) match against a list of URIs specified by the submit-value option and the submit-name option is not used.

submit-value

Specifies the value of the HTTP request element that must be matched to identify the request as a credentials submit request for the application. This is one of: the cookie value, the header value, or a list of URIs (one per line) as specified by the submit-type option. Cookie or header value could be set to none,

in which case only the presence of the named cookie or header is checked and the value is not checked. When checking for URI, the value must be specified. This option is not used when submit-autodetect is true.

success-match-type

Specifies how the SSOv2 module detects whether the credentials submit request was successful. When the SSOv2 module detects that the credentials submission failed, the SSOv2 configuration used for this HTTP transaction is disabled for the user session. If you specify a value for this option, you must also specify a value for success-match-value. The default is none. The options are:

url Credentials submission was successful if the response contains the HTTP Location header with a value matching one of the URLs specified by the success-match-value option.

cookie

Credentials submission was successful if the response contains the HTTP cookie with the name specified by the success-match-value option.

none No check is performed. If SSO logon fails and the application server redirects back to the logon page that matches the criteria of the logon page request, SSO will be retried, possibly causing authentication loop.

success-match-value

Specifies the value used to detect the success or failure of the SSO logon. When the success-match-type option is set to url, this is a list of URLs. Each URL in the list can contain a single wildcard character (*). When the success-match-type option is set to cookie, this option specifies the name of the cookie. The default is none.

headers

Specifies the name and value of the HTTP header to be inserted in an HTTP Request that passes through the APM SSOv2 module.

[name]

Specifies the name of the headers item.

The options are:

app-service

Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

name Specifies the name of the HTTP header.

value

Specifies the value of the HTTP header.

apm-log-config

Specifies log-setting object to associate with this sso. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

log-level

log-level is deprecated. Instead use apm-log-config to customize log-setting.

apm sso kerberos

NAME

kerberos - Configures a Kerberos configuration object.

MODULE

apm sso

SYNTAX

Configure the kerberos component within the sso module using the syntax

shown in the following sections.

CREATE/MODIFY

```
create kerberos [name]
modify kerberos [name]
options:
  account-name [string]
  account-password [string]
  apm-log-config [[string] | none]
  app-service [[string] | none]
  headers [add | delete | modify | replace-all-with] {
    [name] {
      options:
        app-service [[string] | none]
        hname [[string] | none]
        hvalue [[integer] | none]
      }
    }
  kdc [[string] | none]
  location-specific [true | false]
  realm [string]
  send-authorization [401 | always]
  spn-pattern [[string] | none]

```

```
show kerberos
show kerberos [name]
```

DELETE

```
delete kerberos [name]
```

DESCRIPTION

You can use the kerberos component to configure an SSO Kerberos configuration object. Kerberos is an authentication protocol, where both the user and the server verify the other's identity.

EXAMPLES

```
create mykerberos { realm MYREALM.COM account-name apmaccount account-
password **** }
Creates an SSO kerberos configuration object named mykerberos for
the realm myrealm.com, where the account name is apmaccount and
the password is ****.
```

OPTIONS

account-name
Specifies the name of the Active Directory account configured for delegation. This account must be configured in the server's Kerberos realm (AD Domain). If servers are from multiple realms, each realm (AD Domain) must have its own delegation account. This option is required.

account-password
Specifies the password for the delegation account specified in account-name. This option is required.

apm-log-config
Specifies log-setting object to associate with this sso. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

headers
Specifies custom HTTP headers to insert into a request. The default value is none. The options are:

app-service
Specifies the name of the application service to which the header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the header. Only the application service can modify or delete the header.

hname
Specifies the name of a header to add to a request.

hvalue
Specifies the value of a header to add to a request.

kdc Specifies the IP Address or host name of the Kerberos Key

Distribution Center (KDC) for the server's realm. This is normally an Active Directory domain controller. If you leave this empty, the KDC must be discoverable through DNS, for example, BIG-IP system must be able to fetch SRV records for the server realm's domain. If the server realm's domain name is different from the server's realm name, you must specify the server realm's domain name in the /etc/krb5.conf file. Kerberos SSO processing is fastest when KDC is specified by its IP address, slower when specified by host name, and even slower (due to additional DNS queries) when left empty. When a user's realm is different from server's realm, the KDC value must be empty. This is true in cases of cross-realm SSO. The default is none.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies the name for the SSO Kerberos configuration object. This option is required.

realm
Specifies the realm of application server(s), for example, pool members or portal access resource hosts. If the servers are located in multiple realms, each realm requires a separate SSO configuration. You must specify the realm in uppercase letters. The user's realm can be specified through the session.logon.last.domain session variable, and if this variable is not set, then the user's realm is assumed to be the same as the server's realm. This option is required.

send-authorization
Specifies when to submit a Kerberos ticket to the application server(s). The ticket is submitted in an HTTP Authorization header. The header value starts with the word Negotiate, followed by one space and a base64-encoded GSSAPI token containing the Kerberos ticket. If a request contains an Authorization header from the user's browser, it is deleted. The default is always. The options are:

401 The BIG-IP system first forwards the user's HTTP request to the web server without inserting a new Authorization header; however, the browser's Authorization header is deleted. If the server requests authentication by responding with a 401 status code, BIG-IP retries the request with the Authorization header. The Kerberos ticket GSSAPI representation uses the SPNEGO mechanism type (OID 1.3.6.1.5.5.2).

Specifying 401 results in additional BIG-IP/server request round trips in case authentication is required for the request.

always
The BIG-IP system inserts an Authorization header, including the Kerberos ticket, into every HTTP request, whether the request requires authentication or not. The Kerberos ticket GSSAPI representation uses the KRB5 Kerberos 5 mechanism type (OID 1.2.840.113554.1.2.2).

Specifying Always results in the additional overhead of generating a Kerberos token for every request. This is the default value.

spn-pattern
Specifies how the Service Principal Name (SPN) for the server is constructed. For example, HTTP/%s@[server realm name configured in the realm option], where %s will be substituted with the hostname of your server discovered through reverse DNS lookup using the server IP address. Only specify this option when you need non-standard SPN format. The default is none.

ticket-lifetime
Specifies the lifetime of Kerberos tickets obtained for the user. The value represents the maximum ticket lifetime. The actual ticket lifetime may be less by up to 1 hour, because a user's ticket lifetime is the same as the Kerberos Ticket Granting Ticket (TGT) lifetime. A TGT is obtained for the delegation account specified in this configuration. A new TGT is fetched every time the current TGT is older than one hour. The new TGT can only be fetched when an SSO request is processed.

The minimum ticket lifetime is 10 minutes. There is no maximum, however, the ticket lifetime of most AD domains is 10 hours (600 minutes). F5 Networks recommends that you set the ticket lifetime in an SSO configuration above what is specified in an AD domain. The default is 600 minutes.

upn-support
Enables or disables UPN suffix support for Kerberos SSO when integrating into Microsoft Active Directory infrastructure. The default is disabled.

user-realm-source
Session variable name from which Kerberos SSO should read the user's realm. The default is session.logon.last.domain.

username-source
Session variable name from which Kerberos SSO should read the

username. The default is session.sso.token.last.username.

apm sso ntlmv1

NAME

ntlmv1 - Configures a single sign-on (SSO) NT LAN Manager, version 1 (ntlmv1) configuration object.

MODULE

apm sso

SYNTAX

Configure the ntlmv1 component within the sso module using the syntax shown in the following sections.

CREATE/MODIFY

```
create ntlmv1 [name]
modify ntlmv1 [name]
options:
  apm-log-config [[string] | none]
  app-service [[string] | none]
  domain-source [session.logon.last.domain | none]
  headers [add | delete | modify | replace-all-with] {
    [name] {
      options:
        app-service [[string] | none]
        hname [[string] | none]
        hvalue [[integer] | none]
      }
  }
  location-specific [true | false]
  ntlm-domain [[string] | none]
  password-source [session.sso.token.last.password | none]
  username-conversion [enabled | disabled]
  username-source [session.sso.token.last.username | none]
```

```
edit ntlmv1 [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list ntlmv1
list ntlmv1 [ [ [name] | [glob] | [regex] ] ... ]
show running-config ntlmv1
show running-config ntlmv1 [ [ [name] | [glob] |
  [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show ntlmv1
show ntlmv1 [name]
```

DELETE

```
delete ntlmv1 [name]
```

DESCRIPTION

You can use this ntlmv1 component to configure a single sign-on NT LAN Manager, version 1 configuration object.

EXAMPLES

```
create ntlmv1 myntlmv1
Creates an SSO ntlmv1 configuration object named myntlmv1.
```

OPTIONS

apm-log-config
Specifies log-setting object to associate with this sso. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object,

you cannot modify or delete the object. Only the application service can modify or delete the object.

domain-source
Specifies the Session variable used as a source for the single sign-on user domain. The default is `session.logon.last.domain`.

headers
Specifies the name and value of the HTTP header content to be inserted in an HTTP Request that passes through the APM SSO module. The default is none.

The options are:

app-service
Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

hname
Specifies the name of the HTTP header.

hvalue
Specifies the value of the HTTP header.

location-specific
Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The `location-specific` attribute is either true or false. When using `policy sync`, mark an object as `location-specific` to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]
Specifies the name for the SSO `ntlmv1` configuration object. This option is required.

ntlm-domain
Specifies the static domain setting. If the domain is not retrieved successfully from the source specified in the `domain-source` option, the system uses this value for the source.

password source
Specifies the source from which you want SSO to retrieve the password to use to authenticate applications. The default is `session.sso.token.last.password`.

username-conversion
Enables or disables conversion of `PREWIN2k/UPN` username input format to the format you want to use for SSO. The default is disabled.

username-source
Specifies the source from which you want SSO to retrieve the username used to authenticate applications.

show running-config ntlmv2
show running-config ntlmv2 [ [ [name] | [glob] |
    [regex] ] ... ]
options:
    all-properties
    non-default-properties
    one-line
    partition

show ntlmv2
show ntlmv2 [name]

DELETE
delete ntlmv2 [name]

DESCRIPTION
    You can use the ntlmv2 component to configure a single sign-on NT LAN
    Manager, version 2 configuration object.

EXAMPLES
    create ntlmv2 myntlmv2
    Creates an SSO ntlmv2 configuration object named myntlmv2.

OPTIONS
    apm-log-config
    Specifies log-setting object to associate with this sso. If this
    value is empty, logging framework uses log-setting configuration
    associated with the access profile where sso is used.

    app-service
    Specifies the name of the application service to which the object
    belongs. The default value is none. Note: If the strict-updates
    option is enabled on the application service that owns the object,
    you cannot modify or delete the object. Only the application
    service can modify or delete the object.

    domain-source
    Specifies the Session variable used as a source for the single
    sign-on user domain. The default is session.logon.last.domain.

    headers
    Specifies the name and value of the HTTP header content to be
    inserted in an HTTP Request that passes through the APM SSO
    module. The default is none.

    The options are:

    app-service
    Specifies the name of the application service to which the
    HTTP header belongs. The default value is none. Note: If the
    strict-updates option is enabled on the application service
    that owns the object, you cannot modify or delete the HTTP
    header. Only the application service can modify or delete the
    HTTP header.

    hname
    Specifies the name of the HTTP header.

    hvalue
    Specifies the value of the HTTP header.

    location-specific
    Specifies whether or not this object contains one or more
    attributes with values that are specific to the location where the
    BIG-IP device resides. The location-specific attribute is either
    true or false. When using policy sync, mark an object as location-
    specific to prevent errors that can occur when policies reference
    objects, such as authentication servers, that are specific to a
    certain location.

    [name]
    Specifies a name for the sso ntlmv2 configuration object. This
    option is required.

    ntlm-domain
    Specifies the static domain setting. If the domain is not
    retrieved successfully from the source specified in the domain-
    source option, the system uses this value for the source.

```

password source
Specifies the source from which you want SSO to retrieve the password to use to authenticate applications. The default is `session.sso.token.last.password`.

username-conversion
Enables or disables conversion of PREWIN2k/UPN username input format to the format you want to use for SSO. The default is disabled.

username-source
Specifies the source from which you want SSO to retrieve the username used to authenticate applications.

apm sso oauth-bearer

NAME

`oauth-bearer` - Configures a single sign-on (SSO) `oauth-bearer` configuration object.

MODULE

`apm sso`

SYNTAX

Configure the `oauth-bearer` component within the `sso` module using the syntax shown in the following sections.

CREATE/MODIFY

```
create oauth-bearer [name]
modify oauth-bearer [name]
options:
  app-service [[string] | none]
  headers [add | delete | modify | replace-all-with] {
  location-specific [true | false]
  [name] {
    options:
      app-service [[string] | none]
      hname [[URL] | none]
      hvalue [[integer] | none]
    }
  }
  location-specific [true | false]
  oauth-server [string]
```

```
edit oauth-bearer [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list oauth-bearer
list oauth-bearer [ [ [name] | [glob] | [regex] ] ... ]
show running-config oauth-bearer
show running-config oauth-bearer [ [ [name] | [glob] |
[regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show oauth-bearer
show oauth-bearer [name]
```

DELETE

```
delete oauth-bearer [name]
```

DESCRIPTION

You can use the `oauth-bearer` component to create, modify, display, or delete an SSO `oauth-bearer` configuration object.

EXAMPLES

```
create oauth-bearer myoauth-bearer
```

Creates an SSO `oauth-bearer` configuration object named `myoauth-bearer`.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

headers

Specifies the name and value of the HTTP header content to be inserted into an HTTP Request that passes through the APM SSO module. The default is none. The options are:

app-service

Specifies the name of the application service to which the HTTP header belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the HTTP header. Only the application service can modify or delete the HTTP header.

hname

The name of the HTTP header.

hvalue

The value of the HTTP header.

location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location.

[name]

Specifies a name for the SSO oauth-bearer configuration object. This option is required.

partition

Displays the partition in which the object resides.

oauth-server

Specifies the name of your OAuth Server. This option is required.

SEE ALSO

apm sso saml-resource

NAME

saml-resource - Configures saml resource.

MODULE

apm sso

SYNTAX

Configure a saml-resource using the syntax shown in the following sections.

CREATE/MODIFY

```
create saml-resource [name]
```

```
modify saml-resource [name]
```

options:

```
app-service [[string] | none]
customization-group [[string] | none]
description [[string] | none]
location-specific [true | false]
publish-on-webtop [true | false]
sso-config-saml [[string] | none]
```

```
edit saml-resource [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list saml-resource
```

```
list saml-resource [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config saml-resource
show running-config saml-resource [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete saml-resource [name]
```

DESCRIPTION
You can use saml-resource component to configure saml resource.

EXAMPLES
create saml-resource my_saml_resource { sso-config-saml my_saml_sso_obj
publish-on-webtop true }
Creates a saml resource named my_saml_resource with saml sso
object 'my_saml_sso_obj' and with option to display this resource
on full webtop.

delete saml-resource my_saml_resource
Deletes the saml resource named my_saml_resource.

OPTIONS
app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

customization-group
Specifies the customization group associated with saml resource.

description
Specifies a description for the saml resource. The default is
none.

location-specific
Specifies whether or not this object contains one or more
attributes with values that are specific to the location where the
BIG-IP device resides. The location-specific attribute is either
true or false. When using policy sync, mark an object as location-
specific to prevent errors that can occur when policies reference
objects, such as authentication servers, that are specific to a
certain location.

publish-on-webtop
Specifies whether to display the SAML resource on the full webtop
or not. Default value is true.

sso-config-saml
Specifies saml sso config object associated with this saml
resource. This saml sso object should only have one saml sp
connector associated with it.

COPYRIGHT

BIG-IP 2016-03-14 apm sso saml-resource(1)

apm sso saml-sp-automation

NAME
saml-sp-automation - Specify SAML SP connector automation configuration
used to automate creation and management of 'SP Connectors' from the
remotely published metadata file(s).

MODULE
apm sso

SYNTAX
Configure the saml-sp-automation component within the sso module using
the syntax shown in the following sections.

```
CREATE/MODIFY
create saml-sp-automation [name]
modify saml-sp-automation [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  dns-resolver-name [string]
  frequency [integer]
  metadata-urls [add | delete | modify | none | replace-all-with] {
```

```

    name [string] {
    url-value [string]
    }
}
serverssl-profile-name [[string] | none]
sp-obj-name-tag [string]
sso-config-saml [string]

edit saml-sp-automation [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list saml-sp-automation
list saml-sp-automation [ [ [name] | [glob] | [regex] ] ... ]
show running-config saml-sp-automation
show running-config saml-sp-automation [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete saml-sp-automation [name]

```

DESCRIPTION
 You can use saml-sp-automation to create and manage SAML SP automation objects that are used to create, modify, and delete 'SP Connectors' from the remotely published metadata files.

EXAMPLES

```

create saml-sp-automation my_sp_automation { metadata-urls add { f5 {
url-value https://f5.com/metadata.xml } } dns-resolver-name . sso-
config-saml my_saml_idp serverssl-profile-name serverssl } Creates SAML
SP automation object named my_sp_automation bound to a SAML IdP service
my_saml_idp with frequency set to 60 minutes with one entry for
metadata-url as https://f5.com/metadata.xml, dns-resolver-name as . and
serverssl-profile-name as serverssl.
list saml-sp-automation
Displays a list of SAML SP automation objects.

delete saml-sp-automation my_sp_automation
Deletes the my_sp_automation SAML SP automation object.

```

OPTIONS

app-service
 Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description
 Specifies the description for the IdP automation object.

dns-resolver-name
 Specifies the DNS resolver object to be used for connecting to servers hosting metadata file(s).

frequency
 The frequency in minutes at which APM polls the SP metadata files and updates the SP connectors and bindings to the specified SSO SAML server. The default value is 60.

metadata-urls
 Specifies a list of one or more URLs containing the metadata files.

serverssl-profile-name
 Specifies the SSL profile to be used by the BIG-IP system when connecting to the server hosting metadata file(s).

sp-obj-name-tag
 Specifies the name of a tag within the metadata file that contains a value that APM includes in the names of the created SP connectors. If no value is specified, entityID from metadata is used as part of created SP connector name.

sso-config-saml
 Specifies the SSO SAML server to which the SP connectors created by this automation are bound.

options:
 all-properties
 app-service
 non-default-properties
 one-line
 partition

DELETE
delete saml-sp-connector [name]

DESCRIPTION
You can use the saml-sp-connector component to create and manage saml sp connectors

EXAMPLES
create saml-sp-connector my_saml_sp_connector { entity-id "https://companyx.sp.com/sp" assertion-consumer-services { { uri "https://companyx.sp.com/acs/" is-default true } } want-assertion-signed true want-response-signed true want-assertion-encrypted true encryption-type aes256 is-authn-request-signed false sp-certificate default.crt }
Creates a SAML sp-connector named my_saml_sp_connector with security options to encrypt and sign the assertion as well as SAML response.

create saml-sp-connector my_saml_sp_connector1 { import-metadata /shared/tmp/sp_metadata.xml }
Creates a SAML sp-connector named my_saml_sp_connector1 from metadata file "/shared/tmp/sp_metadata.xml"

create saml-sp-connector my_internal_sp_connector { entity-id "https://internal.sp.com" assertion-consumer-services { { uri "https://internal.sp.com/acs" is-default true } } sp-certificate default.crt sp-location internal }
Creates a SAML sp-connector named my_internal_sp_connector which is load balanced by the same virtual server as this BIG-IP as IdP [identity provider].

list saml-sp-connector
Displays a list of SAML sp connectors.

delete saml-sp-connector my_saml_sp_connector
Deletes the my_saml_sp_connector SAML sp connector.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

assertion-consumer-services

List of assertion consumer services (ACS) used by external SP. Each ACS entry contains attributes 'binding', 'index', 'is-default', and 'url'. Each ACS must contain a valid URL, and a unique 'index'. One ACS entry must be set as default.

assertion-consumer-binding

This attribute is DEPRECATED. Use assertion-consumer-services instead.

assertion-consumer-uri

This attribute is DEPRECATED. Use assertion-consumer-services instead.

description

Specifies a unique description for saml sp connector. The default is none.

encryption-type

Specifies the type of encryption BIG-IP as IdP should use to encrypt the assertion. Default is aes128.

entity-id

Specifies a unique ID to identify SP pointed by sp connector.

import-metadata

Specifies the metadata file to be used to create sp connector object. For example: create saml-sp-connector
my_saml_sp_connector1 { import-metadata
/shared/tmp/sp_metadata.xml}

is-authn-request-signed

Specifies whether SP signs authentication requests while sending them to BIG-IP as IdP. The default value for this is false.

location-specific

Objects of this class might have location specific attribute(s). Admin can indicate if object is location specific by setting it to true.

metadata-cert

Specifies the certificate to be used to verify the signature of metadata imported from a file.

multi-domain-location

Specifies the scheme, hostname, and (optionally) port of the virtual server on this BIG-IP behind which this SP is located, e.g. "https://application.f5.com". This configuration is required only when sp-location attribute is configured as 'internal-multi-domain'

relay-state

Specifies the value sent to the SP by BIG-IP as IdP as part of the response. This value is only used if the SP did not send RelayState as part of the authentication request.

signature-type

Signature algorithms to be used for digital signing of SAML messages. Default value is rsa-shal.

single-logout-binding

This attribute is reserved for future functionality.

single-logout-response-uri

A URI where this BIG-IP as IdP will send single logout (SLO) responses.

single-logout-uri

A URI where this BIG-IP as IdP will send single logout (SLO) requests.

sp-certificate

Specifies SP certificate used by BIG-IP as IdP to verify the signature of authentication request.

sp-location

Specifies the location of SP from network topology viewpoint. Default value external should be used with SAML WebSSO profile. This value indicates that SP is located externally from BIG-IP perspective, and therefore SP is reachable directly by the user-agent. internal - indicates that configured SP is located behind the virtual server that hosts BIG-IP IdP, and therefore SP is not reachable directly by the client. internal-multi-domain - indicates that BIG-IP is configured for multi-domain SSO, and therefore SP is located behind different virtual server of this BIG-IP.

sp-name-qualifier

Optionally qualifies an identifier with the name of a service provider or affiliation of providers.

want-assertion-encrypted

Specifies whether SP requires encrypted assertions. The default value for this attribute is false

want-assertion-signed

Specifies whether SP requires signed assertions. The default value for this attribute is true

want-response-signed
Specifies whether SP requires signed SAML responses. The default value for this attribute is false

options:
 all-properties

app-service
non-default-properties
one-line
partition

DELETE
delete saml [name]

DESCRIPTION

You can use the saml component to create and manage SAML SSO objects.

EXAMPLES

```
create saml my_saml_sso_obj { entity-id
  "https://myidpvs.big-ip.com/idp" subject-type email-address subject-
  value test@mycompany.com idp-certificate default.crt idp-signkey
  default.key sp-connectors add { google_apps salesforce }}
Creates a SAML SSO object named my_saml_sso_obj with SP connectors
"google_apps" and "salesforce"

create saml my_saml_sso_obj1 { entity-id
  "https://myidpvs.big-ip.com/idp" subject-type email-address subject-
  value test@mycompany.com idp-certificate default.crt idp-signkey
  default.key sp-connectors add { google_apps sp_salesforce } attributes
  {{name "group" multi-values { "PD" "Admin" }} {name "title" multi-
  values { "engineer1" }}} }
Creates a SAML SSO object named my_saml_sso_obj1 with attributes
"group" and "title".

list saml
Displays list of SAML SSO objects.

delete saml my_saml_sso_obj
Deletes the my_saml_sso_obj SAML SSO object.
```

OPTIONS

apm-log-config
Specifies log-setting object to associate with this saml. If this value is empty, logging framework uses log-setting configuration associated with the access profile where sso is used.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

assertion-validity
Specifies assertion validity period in seconds.

artifact-resolution-service-name
Specifies the artifact resolution service to be used by this BIG-IP as IdP to receive artifacts and resolve them for assertions.

attributes
Specifies list of attributes as part of assertion. Both attribute name and values can be session variables. Property 'value' is DEPRECATED; "multi-values" must be used instead. "name-format" can be used to optionally specify format of the attribute name.

```
create saml my_saml_sso_obj1 { entity-id
  "https://myidpvs.big-ip.com/idp" subject-type email-address
  subject-value test@mycompany.com idp-certificate default.crt idp-
  signkey default.key sp-connectors add { google_apps sp_salesforce
  } attributes {{name "group" multi-values {
  %{session.ldap.last.attr.primarygroup}}} {name "name" multi-
  values { "firstName" "lastName" } name-format basic}} }
Creates a SAML SSO object named my_saml_sso_obj1 with attributes
"group" and "name".
```

auth-context-method
Specifies an authentication context method used by this BIG-IP as IdP when creating assertions. This attribute can be a session variable.

description
Specifies a unique description for SAML SSO object. The default is none.

encrypt-subject
Set to true if assertion 'Subject' must be encrypted. Default value is false.

encryption-type-subject
Encryption algorithm used to encrypt 'Subject' element in assertion. Default value is aes128.

entity-id
Specifies unique identifier for BIG-IP as IdP. Typically, 'entity-id' is a URI that points to the BIG-IP virtual server that is going to act as a SAML IdP. In case 'entity-id' is not a valid URL, the idp-host attribute is required. Examples of valid configuration include "https://mycompany-idp", "idp:my:company", and "idp.my.company.com"

export-metadata
You can simplify SAML configuration using metadata files. When you use APM as an IdP, you can export metadata for IdP. You can save metadata to a file and give it to the SP to enable SP to import SP's SAML configuration or enable SP to use information from the metadata file to configure the IdP. You can choose to sign metadata while exporting it for better security.

For example:

1. Exporting metadata with signing. This requires metadata-signkey and metadata-cert files.

```
modify saml my_saml_sso_obj {export-metadata with-signing metadata-file /shared/idp_signed_metadata.xml metadata-
```

2. Exporting metadata with no signing.

```
modify saml my_saml_sso_obj {export-metadata no-signing metadata-file /shared/idp_metadata.xml}
```

idp-certificate

BIG-IP includes this certificate in the SAML IdP metadata that you export. After the SAML IdP metadata is imported on the SP, the SP can use this certificate to verify the signature of assertion sent by this BIG-IP as IdP.

idp-certificate-session-var

Specifies the certificate this BIG-IP as IdP will use to sign SAML messages including SAML assertion. This attribute must be specified in session variable format. This attribute is mutually exclusive with .

idp-host

Hostname of this BIG-IP as IdP. This attribute is required when "entity-id" is not a valid URL.

idp-scheme

Scheme used by this BIG-IP as IdP. This attribute is only used when idp-host is not empty. Default value is https.

idp-signkey

Specifies the private key used for signing assertion by BIG-IP as IdP.

idp-signkey-session-var

Specifies the signing key this BIG-IP as IdP will use to sign SAML messages including SAML assertion. This attribute must be specified in session variable format. This attribute is mutually exclusive with .

key-transport-algorithm

Specifies the key transport algorithm to be used for encrypted attributes, subject-value, or assertion. Default and recommended value is rsa-oaep. rsa-v1.5 is NOT RECOMMENDED due to security risks associated with the algorithm, and should NOT be used except for compatibility with older applications.

location-specific

Objects of this class might have location specific attribute(s). Admin can indicate if object is location specific by setting it to true.

log-level

log-level is deprecated. Instead use apm-log-config to customize log-setting.

metadata-cert

Specifies the certificate with public key of the key pair used in signing the metadata. See export-metadata for more information on metadata export functionality. This is the certificate to include in signed metadata when we export metadata. This might or might not be IdP certificate.

metadata-file

Specifies the file to which metadata is saved. See export-metadata for more information on metadata export functionality.

metadata-signkey

This specifies the key that is used to sign IdP's metadata. See export-metadata for more information on metadata export functionality.

name-qualifier

Specifies the security or administrative domain of the IdP (this BIG-IP system). This value usually matches IdP Entity ID.

saml-profiles

List of SAML profiles enabled on this BIG-IP as IdP. Default value is web-browser-sso.

sp-connectors

Specifies list of SP connectors associated with this SAML SSO object. When this SSO object is assigned to SAML resource then only one entry is allowed for SP connectors. If SAML SSO object is assigned to access profile then you can add multiple SAML SP connectors.

subject-type

Specifies type of the subject to be used while creating SAML assertion.

subject-value

Specifies the value of the subject to be included inside SAML assertion. This can be a session variable. For example:
%{session.last.logonname}, %{session.ad.last.attr.userEmail}

apm swg-content-type

NAME
swg-content-type - Containers for the SWG content types

MODULE
apm

SYNTAX
List the swg-content-type objects. Creating, modifying, or deleting is not allowed.

Here are the valid values: All-Compressed, All-Executable, All-Images, Application-flash, Text-html, Text-pdf

DISPLAY
list swg-content-type
list swg-content-type [[name] | [glob] | [regex] ...]
options:
all-properties
non-default-properties
one-line
partition

DESCRIPTION
Indicates the MIME type of the response content. Used in SWG Response Analytics.

EXAMPLES
list apm swg-content-type

Lists all swg-content-type objects.

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2017-09-05 apm swg-content-type(1)

apm swg-scheme

NAME
swg-scheme - Configures SWG Scheme

MODULE
apm

SYNTAX
Configure a swg-scheme component within the apm module using the syntax shown in the following sections.

CREATE/MODIFY
Each swg-scheme consists of the following.

create swg-scheme [name]
options:
app-service [[string] | none]
description [[string] | none]

modify swg-scheme [name]
options:
app-service [[string] | none]
description [[string] | none]

DISPLAY

```

list swg-scheme
list swg-scheme [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

DESCRIPTION
  Configures an swg-scheme object

EXAMPLES
  create apm swg-scheme scheme1 { app-service none description "My SWG
  Scheme" }

  Creates a new swg-scheme.

  modify swg-scheme scheme1 { description "My SWG Scheme" }

  Modify a swg-scheme by modifying its description string.

OPTIONS
  app-service
  Specifies the application service to which the object belongs. The
  default value is none. Note: If the strict-updates option is enabled
  on the Application Service that owns the object, you cannot modify or
  delete the object. Only the Application Service can modify or delete
  the object.

  description
  Specifies a user-defined description for the swg scheme.

BIG-IP      2014-12-19      apm swg-scheme(1)

```

apm url-filter

```

NAME
  url-filter - Configures URL filters for URL classification and
  filtering

MODULE
  apm

SYNTAX
  Configure a url-filter component within the apm module using the syntax
  shown in the following sections.

CREATE/MODIFY
  Each url-filter consists of two url-category lists: a list of allowed
  URL categories and a list of blocked URL categories. The requests for
  URLs contained in the allowed list are allowed to pass unfettered,
  whereas requests for URLs in the blocked list will not go out into the
  Internet.

create url-filter [name]
  options:
    allowed-categories [add | delete | modify | replace-all-with] {
    [string]
    }
    blocked-categories [add | delete | modify | replace-all-with] {
    [string]
    }

modify url-filter [name]
  allowed-categories [add | delete | modify | replace-all-with] {
  [string]
  }
  blocked-categories [add | delete | modify | replace-all-with] {
  [string]
  }

DISPLAY
list url-filter
list url-filter [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

```

CP
cp url-filter [source-name] [target-name]

DESCRIPTION

Configures a url-filter

NOTE: A url-filter can have a large number of URL categories in each list. To facilitate the creation of url-filter, you can create a new url-filter by copying from an existing url-filter. Then modify each list by adding or removing url-categories to suit your needs.

EXAMPLES

```
create url-filter my-url-filter allowed-categories add {  
Business_and_Economy Education } blocked-categories add { Adult_Content  
Shopping }
```

Creates a new url-filter.

```
modify url-filter my-own-filter allowed-categories delete { Education }
```

Modify a url-filter by deleting a URL category from the allowed list.

```
cp url-filter existing-filter another-filter
```

Create a new url-filter by copying from an existing filter.

OPTIONS

allowed-categories

Specifies the URL categories that should be allowed to pass.

description

Specifies a unique description for the URL filter.

blocked-categories

Specifies the URL categories that should be blocked.

SEE ALSO

sys url-db download-result sys url-db download-schedule and sys url-db url-category

asm

asm device-sync

NAME

device-sync - Contains the ASM timestamp for each device in the group.

MODULE

asm

SYNTAX

Retrieve the list of the device-sync values using the syntax shown in the following section.

DISPLAY

```
list device-sync  
list device-sync [ [ [name] | [glob] | [regex] ] ... ]
```

DESCRIPTION

Use this command to display the current values of the device-sync object, i.e. ASM change times for all devices in the group. This object is designed for internal purposes only (incremented on every ASM change), so do not try to create, modify, or delete it manually.

EXAMPLES

```
list device-sync
```

Displays all last ASM change times of the device group.

SEE ALSO

tmsh, list, glob, regex

COPYRIGHT

BIG-IP 2012-03-02 asm device-sync(1)

asm http-method

NAME
http-method - Lists the available HTTP request methods that can be used in the context of the Application Security Manager(TM).

MODULE
asm

SYNTAX
Retrieve the list of the http-method values using the syntax shown in the following sections.

```
DISPLAY
list http-method
list http-method [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  app-service
  default-act-as
  one-line
  partition
  recursive
```

DESCRIPTION
Use this command to display the possible values of the http-method object to be used in the context of the Application Security Manager. These possible values include predefined and user-defined allowed methods for all security policies, and also are intended to be used in filters of Application Security Logging and in HTTP security profiles.

EXAMPLES
list http-method

Displays all the HTTP methods supported by the ASM.

OPTIONS

app-service
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

default-act-as
Displays the HTTP request method, either GET or POST, based on how you have instructed the system to treat the listed method name; a predefined method has its system default and a user-defined allowed method is configured in the security policy.

partition
Displays the administrative partition within which the component resides.

SEE ALSO
glob, list, regex, security http profile, security log profile, tmsm

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013. All rights reserved.

BIG-IP 2013-06-12 asm http-method(1)

asm httpclass-asm

NAME

httpclass-asm - configure initial ASM settings for applications. This component has been deprecated as of BIG-IP v11.3.0, please use the policy component in the asm module instead.

MODULE
asm

SYNTAX
Configure the httpclass-asm component within the asm module using the syntax shown in the following sections.

CREATE/MODIFY
create httpclass-asm [name]
modify httpclass-asm [name]
options:
active-policy-name [string]
app-service [[string] | none]
language [language]
predefined-policy [predefined-policy]

DISPLAY
list httpclass-asm
list httpclass-asm [[name] | [glob] | [regex]] ...]
show running-config httpclass-asm
show running-config httpclass-asm [[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
partition

DELETE
delete httpclass-asm [name]

DESCRIPTION
Use this command to create, modify, display, or delete an httpclass-asm profile that configures ASM security policies. Changing/setting attributes for an httpclass-asm profile affects the ASM security policy with the same name. Note that modifying the language of an existing profile reconfigures the ASM security policy and deletes the configurations, log entries and statistics of the security policy. This is for advanced usage - this command is intended to be used by the application templates system (iApps(tm)).

EXAMPLES
create asm httpclass-asm my_class active-policy-name my_class_policy
language utf-8 predefined-policy POLICY_TEMPLATE_RAPID_DEPLOYMENT_HTTP

Creates a custom httpclass-asm profile named my_class that causes ASM to configure a security policy that uses the utf-8 application language and the Rapid Deployment security policy.

list httpclass-asm

Displays the properties of all httpclass-asm profiles.

OPTIONS
active-policy-name
Specifies the name of the active security policy. This property has been deprecated. As of BIG-IP v11.1.0, the active security policy name is identical to the HTTP class profile's name.

app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

language
Specifies the language of the web application that the ASM security policy is protecting. Use autocomplete or list /asm webapp-language to get the list of supported languages.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

predefined-policy
Specifies a predefined security policy for a web application. This security policy was prebuilt to provide out of the box security for a known application. Use autocomplete to get a list of applications for which ASM has predefined policies.

SEE ALSO
create, delete, edit, glob, list, ltm virtual, modify, regex, reset-stats, show, tmsk

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013. All rights reserved.

asm policy

NAME
policy - Configures an application security policy.

MODULE
asm

SYNTAX
Configure the policy component within the asm module using the syntax shown in the following sections.

CREATE
create policy [name]
options:
[active | inactive]
app-service [[string] | none]
blocking-mode [enabled | disabled]
description [[string] | none]
encoding [[name] | none]
policy-builder [enabled | disabled]
policy-template [name]
policy-type [security | parent]
parent-policy [name]

MODIFY
modify policy [name]
options:
[active | inactive]
app-service [[string] | none]
blocking-mode [enabled | disabled]
description [[string] | none]
encoding [[name] | none]
policy-builder [enabled | disabled]
policy-template [name]

DISPLAY
list policy [[[name] | [glob] | [regex]] ...]
show running-config policy [[[name] | [glob] | [regex]] ...]
options:
all-properties
one-line
partition
virtual-servers

DELETE
delete policy [name]

SAVE
save policy [name]
options:
overwrite
bin-file [filename]
min-xml-file [filename]
xml-file [filename]

LOAD
load policy [name]
options:
overwrite
file [filename]
xml-string [string]

PUBLISH
publish policy [name]

DESCRIPTION
You can use the policy component to create, modify, display, delete, save, load, or publish an application security policy for use with Application Security Manager functionality.

Note: To display all policy properties available in tmsh, including initial settings used by iApp and advanced configuration accessible in ASM GUI, specify the all-properties option or the detailed properties. By default, only initial properties are displayed: encoding, policy-template and [active | inactive].

Note: The modify command with the properties encoding and/or policy-template causes ASM to reconfigure the security policy and clear all its former data.

Note: The policy-type cannot be modified after the creation of the policy.

Note: The parent-policy can only, optionally, be set while creating a policy with policy-type set to security.

EXAMPLES
create policy my_asm_policy encoding utf-8
Creates a new policy named my_asm_policy with the default language encoding, policy-type set to security and no parent-policy.
modify policy my_asm_policy active
Activates the inactive policy named my_asm_policy.
create policy my_parent_asm_policy encoding utf-8 policy-type parent

Creates a new policy named `my_parent_asm_policy` with the default language encoding.

```
create policy my_security_asm_policy policy-type security parent-policy my_parent_asm_policy
```

Creates a new policy named `my_security_asm_policy`, policy-type set to security and `my_parent_asm_policy` set as the parent policy.

```
list policy
```

Displays the properties of all application security policies.

```
save policy my_asm_policy xml-file my_asm_policy.xml
```

Exports the policy named `my_asm_policy` to the XML file `/var/tmp/my_asm_policy.xml`.

```
load policy my_asm_policy overwrite file /tmp/my_asm_policy.plc
```

Imports the policy named `my_asm_policy` from the file `/tmp/my_asm_policy.plc` and overwrites the policy if it already exists.

```
publish policy my_asm_policy
```

Applies the active policy named `my_asm_policy`.

OPTIONS

`app-service`

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

[`active` | `inactive`]

Activates or deactivates the policy for later association with L7 policies and virtual servers. The default value is `inactive`.

`bin-file`

Specifies the exported file name to be saved in binary format when using the `save` command. The file name should be simple (not a full path); it is saved to the `/var/tmp` directory on the system.

`blocking-mode`

Specifies whether the system blocks a request that triggers a security policy violation or only logs the violation event (transparent mode).

`description`

Specifies an optional description of the security policy.

`encoding`

Specifies the language encoding, which determines how the security policy processes the character sets. This property corresponds to the `language` property of the `httpclass-asm` component.

`file` Specifies the file name from which the policy is going to be imported when using the `load` command. A full path should be specified.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`min-xml-file`

Specifies the exported file name to be saved in compact XML format when using the `save` command. The file name should be simple (not a full path); it is saved to the `/var/tmp` directory on the system. To display the XML output immediately, omit this property, the properties `xml-file` and `bin-file`.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, `modify`, `save`, and `publish`. If it is not specified for the `load` command, the policy name will be taken from the imported settings.

`overwrite`

Specifies that the policy file for the `save` command or the policy component for the `load` command can be overwritten if it exists.

`partition`

Displays the administrative partition within which the component resides.

`policy-builder`

Enables or disables automatic policy building.

`policy-template`

Specifies whether the security policy is based on a predefined security policy template, and if so, which one. If you create or modify a security policy based on a template, the system automatically configures the new security policy according to the conditions of the template. This property corresponds to the `predefined-policy` property of the `httpclass-asm` component.

`policy-type`

Specifies the security policy type, which cannot be changed after you create the policy. The parent policy type cannot be active and cannot have a parent. The security policy type may or may not have a single parent policy defined.

`parent-policy`

Optionally, specifies the name of an existing policy, of policy-

type parent, to be set as the parent policy, while creating a policy-type security.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

Note: This component supports matching by the regex expression only when displaying the initial policy properties.

virtual-servers

Displays the name of the protected virtual server, or virtual servers, which have attached to them the security policy via L7 policies.

xml-file

Specifies the exported file name to be saved in XML format when using the save command. The file name should be simple (not a full path); it is saved to the /var/tmp directory on the system. To display the XML output immediately, omit this property, the properties min-xml-file and bin-file.

xml-string

Specifies the XML document from which the policy is going to be imported when using the load command.

BIG-IP 2016-09-14 asm policy(1)

asm predefined-policy

NAME

predefined-policy - Lists the available predefined policies that can be used in the context of the httpclass-asm profile.

MODULE

asm

SYNTAX

Retrieve the list of the predefined-policy values using the syntax shown in the following sections.

DISPLAY

```
list predefined-policy
list predefined-policy [ [ [name] | [glob] | [regex] ] ... ]
options:
all
one-line
```

DESCRIPTION

Use this command to display the possible values of the predefined-policy object to be used in the context of the httpclass-asm profile. This is for advanced usage; this command is intended for use by the application templates system (iApps).

EXAMPLES

```
list predefined-policy
```

Displays all the predefined policies supported by the ASM.

SEE ALSO

asm httpclass-asm, glob, list, regex, tmsh

COPYRIGHT

BIG-IP 2013-01-27 asm predefined-policy(1)

asm response-code

NAME
response-code - Lists the available HTTP response status codes that can be used in the context of the Application Security Manager.

MODULE
asm

SYNTAX
Retrieve the list of the response-code values using the syntax shown in the following sections.

DISPLAY
list response-code
list response-code [[[number] | [glob] | [regex]] ...]
options:
all
app-service
name
one-line

DESCRIPTION
Use this command to display the possible values of the response-code object to be used in the context of the Application Security Manager. These possible values are predefined and intended to be used in filters of Application Security Logging.

EXAMPLES
list response-code

Displays all the response codes supported by the ASM.

OPTIONS
app-service
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

name Displays a well-known textual meaning of the HTTP response code.

SEE ALSO
glob, list, regex, security log profile, tmsh

COPYRIGHT

BIG-IP 2013-01-27 asm response-code(1)

asm webapp-language

NAME
webapp-language - Lists the available languages that can be used in the context of the httpclass-asm profile.

MODULE
asm

SYNTAX
Retrieve the list of the webapp-language values using the syntax shown in the following sections.

DISPLAY
list webapp-language
list webapp-language [[[name] | [glob] ...]
options:
all
one-line

DESCRIPTION
Use this command to display the possible values of the webapp-language object to be used in the context of the httpclass-asm profile. This is

for advanced usage - this command is intended to be used by the application templates system.

EXAMPLES

```
list webapp-language
```

Displays all the languages supported by the ASM.

SEE ALSO

```
asm httpclass-asm, glob, list, tmsh
```

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-01-27 asm webapp-language(1)

auth

auth apm-auth

NAME

apm-auth - Configures an APM-based authentication object for implementing access policy execution-based authentication of BIG-IP(r) system users.

MODULE

auth

SYNTAX

Configure the apm-auth component within the auth module using the syntax shown in the following sections.

CREATE/MODIFY

```
create apm-auth [name]
modify apm-auth [name]
options:
  profile-access [string]
```

```
edit apm-auth [ [ [name] | [glob] | [regex] ] ...]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list apm-auth
list apm-auth [ [ [name] | [glob] | [regex] ] ...]
show running-config apm-auth
show running-config apm-auth [ [ [name] | [glob] | [regex] ] ...]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete apm-auth [name]
```

DESCRIPTION

You can configure APM-based authentication to execute an access policy for BIG-IP system users to authenticate and authorize them.

APM authentication methods like HTTP, AD/LDAP, TACACS+ authentication can be used in box authentication To authenticate BIG-IP system users.To do this, create an access profile, create APM configuration object with the above access profile, and then activate the object.

The following steps describe how to configure APM-based authentication for BIG-IP system users:

1. Use the profile-access component in the apm module to create a access profile.
2. Use the apm-auth component in the auth module to map an access profile to an APM-based authentication object.
3. To activate APM-based authentication for BIG-IP system users, run the command sequence modify / auth source type apm-auth

EXAMPLES

```
create apm-auth system-auth {profile-access apm-profile}
Creates an APM-based authentication object named system-auth
delete apm-auth system-auth
```

Deletes the APM-based authentication object named system-auth.

OPTIONS

description
User-defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition
Displays the administrative partition within which the component resides.

profile-access
Specifies the access profile that the system must use for APM-based authentication. You must specify an access profile when you create an APM-based configuration object.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

auth user, create, delete, glob, list, modify, regex, run, show, tmsh

BIG-IP 2013-06-17 auth apm-auth(1)

auth cert-ldap

NAME

cert-ldap - Configures an LDAP configuration object for implementing Single Sign On based on a valid client certificate for BIG-IP(r) system users. The user is required to properly configure the Certificate Authority so that unique identifying attributes appear in the subjectName or subjectAltName fields of signed client certificates; the OCSP responder so that it is available to the BIG-IP at the time a client certificate is presented; and the LDAP server so that it includes the required attributes from the client certificate and the corresponding user name.

MODULE

auth

SYNTAX

Configure the cert-ldap component within the auth module using the syntax shown in the following sections.

CREATE/MODIFY

```
create cert-ldap [name]
```

```
modify cert-ldap [name]
```

options:

options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete cert-ldap [name]

DESCRIPTION
The CERT-LDAP authentication mode is required to provide Single Sign On
capability to the control plane based on a valid client certificate.
This mode involves configuring an Apache server to initiate a client
certificate request, perform certificate validation against an OSCP
server, and then authenticate/authorize certificate credentials against
a configured remote LDAP server or a Microsoft(r) Windows(r) Active
Directory(r). The mode is not based on basic HTTP authentication (that
is, user name and password). CERT-LDAP mode is equivalent to LDAP mode
with custom attributes.

To authenticate BIG-IP system users when their authentication data is
stored on a remote LDAP server, you create an LDAP configuration
object, and then activate the object. Make sure that Apache is
configured to support the client certificate validation.

To configure CERT-LDAP authentication for BIG-IP system users:

1. Use the cert-ldap component in the auth module to configure an LDAP
configuration object.

2. To activate LDAP authentication for BIG-IP system users, run the
command sequence modify / auth source type cert-ldap

EXAMPLES
create cert-ldap bigip_cert_ldap_auth servers add {my_ldap_server}

Creates a configuration object named bigip_cert_ldap_auth.

delete cert-ldap bigip_cert_ldap_auth

Deletes the configuration object named bigip_cert_ldap_auth.

OPTIONS
bind-dn
Specifies the distinguished name of an account to which to bind to
perform searches. This search account is a Read-only account. You
can also use the admin account as the search account. If an
administrative distinguished name is not specified, then a bind is
not attempted. The default value is none.

Note: If the remote server is a Microsoft Windows Active Directory
server, the distinguished name must be in the form of an email
address.

bind-pw
Specifies the password for the search account created on the LDAP
server. This option is required if you enter a value for the bind-
dn option. The default value is none.

bind-timeout
Specifies a bind timeout limit, in seconds. The default value is
30.

check-host-attr
Confirms the password for the bind distinguished name. This option
is optional. The default value is disabled.

check-roles-group
Specifies whether to verify a user's group membership given in the
remote-role definitions, formatted as *member*of="group-dn". The
default value is disabled.

debug
Enables or disables syslog-ng debugging information at the LOG
DEBUG level. The default value is disabled. F5 Networks does not
recommend using this option for normal configuration.

description
User defined description.

filter
Specifies a filter. Use this option for authorizing client
traffic. The default value is none.

glob Displays the items that match the glob expression. See help glob

```

for a description of glob expression syntax.

group-dn

Specifies the group distinguished name. The system uses this option for authorizing client traffic. The default value is none.

group-member-attribute

Specifies a group member attribute. The system uses this option for authorizing client traffic. The default value is none.

idle-timeout

Specifies the idle timeout, in seconds, for connections. The default value is 3600 seconds.

ignore-auth-info-unavail

Specifies whether the system ignores authentication information if it is not available. The default value is no.

ignore-unknown-user

Specifies whether the system ignores a user that is unknown. The default value is disabled.

login-attribute

Specifies a logon attribute. Normally, the value for this option is uid; however, if the server is a Microsoft Windows Active Directory server, the value must be the account name samaccountname (not case-insensitive). The default value is none.

login-filter

Specifies the filter to be applied on the CN of the client certificate. This filter is a regular expression to extract required information from CN of client certificate which will be used to match against LDAP search results. The default is disabled.

login-name

Specifies the LDAP attribute holding the client name. (The client name is extracted from the client certificate as specified by ssl-cname-field.) The default is disabled.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which the component resides.

port Specifies the port number or name for the LDAP service. Port 389 is typically used for non-SSL and port 636 is used for an SSL-enabled LDAP service. The default value is ldap.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

scope

Specifies the search scope. The default value is sub. The possible values are:

base The search scope is base object. The base value is almost never useful for name service lookups.

one The search scope is one level.

sub The search scope is a subtree.

search-base-dn

Specifies the search base distinguished name. The default value is none.

search-timeout

Specifies the search timeout, in seconds. The default value is 30.

servers

Specifies the LDAP servers that the system must use to obtain authentication information. You must specify a server when you create an LDAP configuration object.

ssl Enables or disables SSL functionality. The default is disabled.

Note that when you use tmsh to enable SSL for an LDAP service, the system does not change the port number from 389 to 636, as is required. To change the port number from the command line, use the port option, for example, ldap [name] ssl enabled port 636.

ssl-ca-cert-file

Specifies the name of an SSL CA certificate using the full path to the file. The default value is none.

ssl-check-peer

Specifies whether the system checks an SSL peer. The default value is disabled.

ssl-ciphers

Specifies SSL ciphers. The default value is none.

ssl-client-cert

Specifies the name of an SSL client certificate. The default value is none.

ssl-client-key

Specifies the name of an SSL client key. The default value is

none.

ssl-cname-field

Specifies the value from the client certificate that provides the client name. The client name must appear in either the subjectName or subjectAltName (SAN) fields in the X.509v3 certificate. If it appears in the subjectName field, the client name must be the commonName (CN). If the client name appears in the SAN, it will have the specified type. If san-other is specified, the ssl-cname-otheroid must provide the OID of the UTF8 string containing the client name. The choices are: subjectname-cn, san-other, san-email, san-dns, san-x400, san-dirname, san-ediparty, san-uri, san-ipadd, or san-rid. The default value is subjectname-cn.

ssl-cname-otheroid

Specifies the OID in dotted-decimal format of the UTF8 string in the client's X.509v3 subjectAltName "other" attribute. This value is required when ssl-cname-field is san-other. The default value is none.

sso Enables or disables Single Sign On (SSO) functionality. SSO eliminates the need to administer and maintain multiple user logons and eliminates the need for users to enter their credentials multiple times. When SSO is disabled, the user will be prompted to authenticate into the BIG-IP. The default is off.

user-template

Specifies a user template for the LDAP application to use for authentication. The default value is none.

version

Specifies the version number of the LDAP application. The default value is 3.

warnings

Enables or disables warning messages. The default value is enabled.

DELETE
delete ldap [name]

DESCRIPTION
LDAP authentication is useful when the BIG-IP system users
authentication or authorization data is stored on a remote LDAP server
or a Microsoft(r) Windows(r) Active Directory(r) server, and you want
the user credentials to be based on basic HTTP authentication (that is,
user name and password).

To authenticate BIG-IP system users when their authentication data is
stored on a remote LDAP server, you create an LDAP configuration
object, and then activate the object.

The following steps describe how to configure LDAP authentication for
BIG-IP system users:

1. Use the ldap component in the auth module to configure an LDAP
configuration object.

2. To activate LDAP authentication for BIG-IP system users, run the
command sequence modify / auth source type ldap

EXAMPLES
create ldap bigip_ldap_auth servers add {my_ldap_server}

Creates a configuration object named bigip_ldap_auth

delete ldap bigip_ldap_auth

Deletes the configuration object named bigip_ldap_auth.

OPTIONS
bind-dn
Specifies the distinguished name of an account to which to bind to
perform searches. This search account is a Read-only account. You
can also use the admin account as the search account. If an
administrative distinguished name is not specified, then a bind is
not attempted. The default value is none.

Note that if the remote server is a Microsoft Windows Active
Directory server, the distinguished name must be in the form of an
email address.

bind-pw
Specifies the password for the search account created on the LDAP
server. This option is required if you enter a value for the bind-
dn option. The default value is none.

bind-timeout
Specifies a bind timeout limit, in seconds. The default value is
30.

check-host-attr
Confirms the password for the bind distinguished name. This option
is optional. The default value is disabled.

check-roles-group
Specifies whether to verify a user's group membership given in the
remote-role definitions, formatted as *member*of="group-dn". The
default value is disabled.

debug
Enables or disables syslog-ng debugging information at the LOG
DEBUG level. The default value is disabled. F5 Networks does not
recommend using this option for normal configuration.

description
User defined description.

filter
Specifies a filter. Use this option for authorizing client
traffic. The default value is none.

glob Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

group-dn
Specifies the group distinguished name. The system uses this

```

option for authorizing client traffic. The default value is none.

group-member-attribute
Specifies a group member attribute. The system uses this option for authorizing client traffic. The default value is none.

idle-timeout
Specifies the idle timeout, in seconds, for connections. The default value is 3600 seconds.

ignore-auth-info-unavail
Specifies whether the system ignores authentication information if it is not available. The default value is no.

ignore-unknown-user
Specifies whether the system ignores a user that is unknown. The default value is disabled.

login-attribute
Specifies a logon attribute. Normally, the value for this option is uid; however, if the server is a Microsoft Windows Active Directory server, the value must be the account name samaccountname (not case-insensitive). The default value is none.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition
Displays the administrative partition within which the component resides.

port Specifies the port number or name for the LDAP service. Port 389 is typically used for non-SSL and port 636 is used for an SSL-enabled LDAP service. The default value is ldap.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

scope
Specifies the search scope. The default value is sub. The possible values are:

base The search scope is base object. The base value is almost never useful for name service lookups.

one The search scope is one level.

sub The search scope is a subtree.

search-base-dn
Specifies the search base distinguished name. The default value is none.

search-timeout
Specifies the search timeout, in seconds. The default value is 30.

servers
Specifies the LDAP servers that the system must use to obtain authentication information. You must specify a server when you create an LDAP configuration object.

ssl Enables or disables SSL functionality. The default is disabled.

Note that when you use tmsh to enable SSL for an LDAP service, the system does not change the port number from 389 to 636, as is required. To change the port number from the command line, use the port option, for example, ldap [name] ssl enabled port 636.

ssl-ca-cert-file
Specifies the name of an SSL CA certificate using the full path to the file. The default value is none.

ssl-check-peer
Specifies whether the system checks an SSL peer. The default value is disabled.

ssl-ciphers
Specifies SSL ciphers. The default value is none.

ssl-client-cert
Specifies the name of an SSL client certificate. The default value is none.

ssl-client-key
Specifies the name of an SSL client key. The default value is none.

user-template
Specifies a user template for the LDAP application to use for authentication. The default value is none.

version
Specifies the version number of the LDAP application. The default value is 3.

warnings
Enables or disables warning messages. The default value is enabled.

BIG-IP 2016-03-14 auth ldap(1)

auth login-failures

NAME
login-failures - Displays or resets the status of the accounts of users whose attempts to log in to the BIG-IP(r) system have failed.

MODULE
auth

SYNTAX
Configure the login-failures component within the auth module using the following syntax.

MODIFY
reset-stats login-failures
options:
username

DISPLAY
show login-failures
options:
field-fmt
username

DESCRIPTION
Users assigned a role of Administrator can reset the status of a user who is locked out of the BIG-IP system due to enforcement of a company's security requirements. Users assigned other roles can only view login failures.

EXAMPLES
show login-failures
Displays the login failure status of all users.
show login-failures joe
Displays login failure status for the user joe.
reset-stats login-failures
Resets the failed login counters for all users to zero and unlocks all users.
reset-stats login-failures joe
Resets the failed login counter for the user joe to zero and unlocks the user joe.

OPTIONS
show For information about the options that you can use with the show command, see help show.

username
Specifies a user account to display or reset.

SEE ALSO
auth user, reset-stats, show, tmsh

auth partition

NAME
partition - Configures administrative partitions that implement access control for BIG-IP(r) system users.

MODULE
auth

SYNTAX
Configure the partition component within the auth module using the syntax shown in the following sections.

CREATE/MODIFY
create partition [name]
modify partition [name]
options:
 default-route-domain [ID]
 description [string]

DISPLAY
list partition
list partition [[[name] | [glob] | [regex]] ...]
show running-config partition
show running-config partition [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line

DELETE
delete partition [name]
options:
 all

DESCRIPTION
An administrative partition is a logical container that you create, containing a defined set of BIG-IP system objects, such as virtual servers, pools, and profiles. When a specific set of objects resides in a partition, you can then give certain users the authority to view and manage the objects in that partition only, rather than all objects on the BIG-IP system. This gives a finer degree of administrative control.

You can configure administrative partitions, only if the Administrator user role is assigned to your user account.

EXAMPLES
create partition partition_A description "Repository for application_A objects"

Creates a partition named partition_A that contains objects related to application_A.

delete partition partition_B

Deletes the partition named partition_B.

OPTIONS
description
Describes the contents of the partition. If you use spaces in the description, you must put quotation marks around the descriptive text, for example, "This partition contains local traffic management objects for managing HTTP traffic."

default-route-domain
Specifies the ID of the route domain that is associated with the IP addresses that reside in the partition. For more information, see help net route-domain.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

auth password-policy

NAME
password-policy - Specifies the parameters of the valid passwords for the BIG-IP(r) system.

MODULE
auth

SYNTAX
Configure the password-policy component within the auth module using the syntax shown in the following sections.

MODIFY
modify password-policy
options:
 expiration-warning [integer]
 max-duration [integer]
 max-login-failures [integer]
 min-duration [integer]
 minimum-length [integer]
 password-memory [integer]
 policy-enforcement [disabled | enabled]
 required-lowercase [integer]
 required-numeric [integer]
 required-special [integer]
 required-uppercase [integer]

DISPLAY
list password-policy
list password-policy
show running-config password-policy
show running-config password-policy
options:
 all-properties
 non-default-properties
 one-line

DESCRIPTION
Users assigned a role of Administrator or Resource Administrator can modify a password policy for the BIG-IP system to enforce a company's security requirements by defining the parameters for valid passwords. Users assigned other roles can view password policies.

EXAMPLES
password-policy max-duration 90 min-duration 30 minimum-length 6
required-lowercase 2 required-uppercase 2 required-special 1 required-numeric 1 expiration-warning 5

Creates a password policy that specifies that passwords are valid for a maximum of 90 days and a minimum of 30 days. Also specifies that to be valid, a password must contain at least 6 characters, but not more than 10 characters, including 2 lowercase alpha characters, 2 uppercase alpha characters, and 1 number. Additionally, this policy specifies that the system automatically warns users five days before their passwords expire.

list password-policy

Displays the password policy.

OPTIONS
expiration-warning
Specifies the number of days before a password expires. Based on this value, the BIG-IP system automatically warns users when their password is about to expire. The default value is 7 days.

max-duration
Specifies the maximum number of days a password is valid. The default value is 99999.

max-login-failures
Specifies the number of consecutive unsuccessful login attempts that the system allows before locking out the user. The default value is 0 (zero - disabled).

min-duration
Specifies the minimum number of days a password is valid. The default value is 0 (zero).

minimum-length
Specifies the minimum number of characters in a valid password. The default value is 6.

password-memory
Specifies whether the user has configured the BIG-IP system to remember a password on a specific computer. The default value is 0 (zero).

policy-enforcement
Enables or disables the password policy on the BIG-IP system. The default value is disabled.

required-lowercase
Specifies the number of lowercase alpha characters that must be present in a password for the password to be valid. The default value is 0 (zero).

required-numeric
Specifies the number of numeric characters that must be present in a password for the password to be valid. The default value is 0 (zero).

required-special
Specifies the number of special characters that must be present in a password for the password to be valid. The default value is 0 (zero).

required-uppercase
Specifies the number of uppercase alpha characters that must be present in a password for the password to be valid. The default value is 0 (zero).

BIG-IP 2016-03-14 auth password-policy(1)

auth password

NAME
password - Prompts for modification of a password, and asks for a confirmation of the new password.

MODULE
auth

SYNTAX
Configure the password component within the auth module using the syntax shown in the following sections.

USAGE
modify password

DESCRIPTION
If you are assigned the user role of Administrator or User Manager, you can change another user's password.

For example, from within the auth module, run the following command sequence: modify password [user name].

The system prompts you for a new password for the specified user, and then to confirm the new password.

If you are assigned any other user role, the system prompts you to change your own password, and then confirm the new password.

To change a password from within another module, use the full path to the password.

EXAMPLES
(tmos.auth)# modify password

From within the auth module, displays the new password: prompt.

(tmos.gtm)# modify / auth password

From within the gtm module, displays the new password: prompt.

SEE ALSO
auth user, modify, tmsh

auth radius-server

NAME
radius-server - Configures a RADIUS server for implementing remote RADIUS-based authentication of BIG-IP(r) system users.

MODULE
auth

SYNTAX
Configure the radius-server component within the auth module using the syntax shown in the following sections.

CREATE/MODIFY
create radius-server [name]
modify radius-server [name]
options:
 app-service [[string] | none]
 description [string]
 port [[name] | [number]]
 secret [none | ["string"]]
 server [[hostname] | [IP address] | none]
 timeout [integer]

edit radius-server [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list radius-server
list radius-server [[[name] | [glob] | [regex]] ...]
show running-config radius-server
show running-config radius-server [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete radius-server [name]

DESCRIPTION
To authenticate BIG-IP system users when their authentication data is stored on a remote RADIUS server, you configure a RADIUS server, configure a RADIUS configuration object that references that RADIUS server, and then activate RADIUS authentication for the BIG-IP system. In this case, client credentials are based on basic HTTP authentication (that is, user name and password).

To configure RADIUS authentication for the BIG-IP system:

1. Use the radius-server component in the auth module to configure a RADIUS server.
2. Use the radius component in the auth module to create a RADIUS configuration object that references the RADIUS server you created in the Step 1. For more information about creating a RADIUS configuration object, see help radius.
3. To activate RADIUS authentication for BIG-IP system users, type the following command sequence: modify / auth source type radius

EXAMPLES
create radius-server bigip_auth_radius_server secret "This is the secret." server 10.1.1.1

Creates a RADIUS server component named bigip_auth_radius_server.

delete radius-server bigip_auth_radius_server

Deletes the RADIUS server component named bigip_auth_radius_server.

OPTIONS
app-service
Specifies the name of the application service to which the RADIUS server belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the RADIUS server. Only the application service can modify or delete the RADIUS server.

description
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition
Displays the partition in which the radius server resides.

port Specifies the port for RADIUS authentication traffic. The default value is 1812.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret
Specifies the secret key the system uses to encrypt and decrypt packets sent from or received by the server. This option is required.

server
Specifies the host name or IP address of the RADIUS server. This option is required.

timeout
Specifies the timeout value in seconds. The default value is 3.

DELETE

delete radius [name]

DESCRIPTION

To authenticate BIG-IP system users when their authentication data is stored on a remote RADIUS server, you configure a RADIUS server, configure a RADIUS configuration object that references that RADIUS server, and then activate RADIUS authentication for the BIG-IP system. In this case, client credentials are based on basic HTTP authentication (that is, user name and password).

To configure RADIUS authentication for the BIG-IP system:

1. Use the radius-server component in the auth module to configure a RADIUS server. For more information about creating a RADIUS server, see help radius-server.
2. Use the radius component in the auth module to create a RADIUS configuration object that references the RADIUS server you created in Step 1.
3. To activate RADIUS authentication for BIG-IP system users, type the following command sequence: modify / auth source type radius

EXAMPLES

```
create radius bigip_radius_auth servers add {myradiusserver}
```

Creates a RADIUS configuration object named bigip_radius_auth.

```
delete radius bigip_radius_auth
```

Deletes the RADIUS configuration component named bigip_radius_auth.

OPTIONS

accounting-bug

Enables or disables validation of the accounting response vector. This option is necessary only on older servers. The default value is disabled.

app-service

Specifies the name of the application service to which the RADIUS configuration object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the RADIUS configuration object. Only the application service can modify or delete the RADIUS configuration object.

client-id

Sends a NAS-Identifier RADIUS attribute with string bar. If you do not specify a value for this option, the system uses the pluggable authentication module (PAM) service type. You can disable this feature by specifying a blank client ID.

debug

Enables or disables syslog-ng debugging information at the LOG DEBUG level. F5 Networks does not recommend this option for normal use. The default value is disabled.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

retries

Specifies the number of authentication retries that the BIG-IP local traffic management system allows before authentication fails. The default value is 3.

service-type

Specifies the type of service used for the RADIUS server. The default is default, which behaves as authenticate-only.

servers

Specifies the host names or IP addresses of existing RADIUS servers that the BIG-IP system uses to obtain authentication data.

SEE ALSO

auth radius-server, auth user, create, delete, glob, list, modify, regex, run, show, tmsk

COPYRIGHT

auth remote-role

NAME
remote-role - Creates remote role information in a file that an LDAP, Active Directory(r), RADIUS, or TACACS+ server reads to determine the specific access rights to grant to groups of remotely-authenticated users.

MODULE
auth

SYNTAX
Configure the remote-role component within the auth module using the syntax shown in the following sections.

MODIFY
modify remote-role
options:
description [string]
role-info [add | delete | modify | replace-all-with] {
 [group-name] {
 options:
 attribute [string]
 console [disabled | tmsb]
 description [string]
 deny [enabled | disabled]
 line-order [integer]
 role [acceleration-policy-editor | admin | fraud-protection-manager |
application-editor | auditor | certificate-manager |
firewall-manager | guest | irule-manager | manager |
no-access | operator | resource-admin | user-manager |
web-application-security-administrator |
web-application-security-editor]
 user-partition [all | Common | [name]]
 user-partition [%string]
 }
 }
role-info none

DISPLAY
list remote-role
show running-config remote-role
options:
all-properties
non-default-properties
one-line

DELETE
You cannot delete the remote-role defaults, you can only modify the values of the options.

DESCRIPTION
You can use the remote-role component to grant access to a specific group of remotely-authenticated users without creating a local user account on the BIG-IP(r) system for each user in the group.

Users assigned the role of Administrator can modify remote roles. Users assigned all other roles can view remote roles.

You can use the variable substitution feature to assign access rights for a group of remote users by specifying a text string variable that is preceded by a leading % character for the options attribute, console, role and user-partition. For example, if you define the remote role for the groups DC1 and DC2 as follows:

```
remote-role {  
  role info {  
    dc1 {  
      attribute "F5-LTM-User-Info-1=DC1"  
      console %F5-LTM-User-Console  
      line-order 1  
      role %F5-LTM-User-Role  
      user-partition %F5-LTM-User-Partition  
    }  
    dc2 {  
      attribute "F5-LTM-User-Info-1=DC2"  
      line-order 2  
    }  
  }  
}
```

The BIG-IP(r) system attempts to match the value of the attribute option, F5-LTM-User-Info-1=DC1, and then pulls the value of the console, role and user-partition options from the other variables.

Note: If a variable includes an incorrect value, the system does not authorize the user. Additionally, if you have not defined the variables, as with the group DC2 above, the system authenticates the user with the following access rights:

```
console = disabled  
role = none  
user-partition = none
```

EXAMPLES

```
modify remote-role role-info add { my_managers { attribute
"memberOF=cn=BigIPmanagerGroup,cn=users,dc=mydept,dc=mycompany,dc=com"
console disabled line-order 1000 role 100 user-partition all } }
```

Configures a remote role, named `my_managers`, for LDAP authentication, by creating the 1000th line of the `/config/bigip/auth/remoterole` file, and granting the Manager role (100) in all partitions to the remote users assigned this role.

```
modify remote-role role-info add { my_admins { attribute "NS-Admin-
Privilege" console tmsh line-order 1000 role 0 user-partition all } }
```

Configures a remote role, named `my_admins`, for LDAP authentication, by creating the 2000th line of the `/config/bigip/auth/remoterole` file, and granting the Administrator role (0) in all partitions to the remote users assigned this role.

```
modify remote-role role-info add { my_managers { attribute
"manager_group=manager" console tmsh line-order 3000 user-partition all
} }
```

Configures a remote role, named `my_managers`, for RADIUS or TACACS+ authentication, by creating the 3000th line of the `/config/bigip/auth/remoterole` file, and granting the Administrator role (0) in all partitions to the remote users assigned this role:

OPTIONS

`description`
Specifies a user-defined description.

`role-info`
Configures the access rights for a specific group of remotely-authenticated users. You can configure the following information for a role:

`attribute`
Specifies an attribute-value pair that an authentication server supplies to the BIG-IP system to match against entries in `/config/bigip/auth/remoterole`. The specified pair typically identifies users with access rights in common. This option is required.

Alternatively, you can use the variable substitution feature (described in the Description section above), and specify a text string variable that is preceded by a leading `%` character.

`console`
Enables or disables console access for the specified group of remotely-authenticated users. The default value is disabled.

When using variable substitution, as described in the Description section of this man page, the variable for the console option must be: `tmsh`.

`deny` Enables or disables remote access for the specified group of remotely-authenticated users. The default value is disabled.

`description`
Specifies a user-defined description.

`group-name`
Specifies the name of the remote role that you are configuring. This option is required.

`line-order`
Specifies the number of the first populated line in the file, `/config/bigip/auth/remoterole`. The LDAP, Active Directory, RADIUS, and TACACS+ servers read this file line by line. The order of the information is important; therefore, F5 Networks recommends that you set the first line at 1000. This allows you, in the future, to insert lines before the first line. This option is required.

`role` Specifies the role that you want to grant to the specified group of remotely-authenticated users. The default value is `no-access`. The available roles are:

- `admin`
- `fraud-protection-manager`
- `application-editor`
- `certificate-manager`
- `firewall-manager`
- `guest`
- `manager`
- `no-access`
- `operator`
- `resource-admin`
- `web-application-security-administrator`
- `web-application-security-editor`

user-manager

When using variable substitution, as described in the Description section above, the variable for the role option must evaluate to one of these values: 0 (admin), 20 (resource admin), 40 (user manager), 80 (auditor), 100 (manager), 300 (application editor), 350 (advanced operator), 400 (operator), 450 (firewall manager), 500 (certificate manager), 510 (irule manager), 700 (guest), 800 (web application security administrator), 810 (web application security editor), 850 (acceleration policy editor), 900 (no-access).

user-partition

Specifies the user partition to which you are assigning access to the specified group of remotely-authenticated users. The default value is Common. This option is required.

Alternatively, you can use the variable substitution feature (described in the Description section above) and specify a text string variable that is preceded by a leading % character.

BIG-IP 2015-12-04 auth remote-role(1)

auth remote-user

NAME

remote-user - Configures the default role, partition access, and console access for all remotely authenticated user accounts that have not been added as local user accounts on the BIG-IP(r) system.

MODULE

auth

SYNTAX

Configure the remote-user component within the auth module using the syntax shown in the following sections.

MODIFY

modify remote-user

options:

```
default-partition [all | Common | [partition name] ]
default-role [acceleration-policy-editor | admin |
fraud-protection-manager | application-editor |
auditor | firewall-manager | guest |
irule-manager | manager | no-access |
operator | resource-admin | user-manager |
web-application-security-administrator |
web-application-security-editor ]
description [string]
remote-console-access [disabled | tmsh]
```

DISPLAY

list remote-user

show running-config remote-user

options:

```
all-properties
non-default-properties
one-line
```

DELETE

You cannot delete the remote-user defaults, you can only modify the values of the options.

DESCRIPTION

You can use the remote-user component to configure the default parameters for all the remote user accounts on the BIG-IP system as a group. To assign a different access level to a specific remote user, you must create a local user account for that user on the BIG-IP system. See the auth user man page for more information.

Users assigned the role of Administrator or Resource Administrator can modify the parameters of the remote-user component. Users assigned all other roles can view the parameters of the remote-user component.

EXAMPLES

```
modify remote-user default-partition Common default-role no access
```

remote-console-access disabled

For all remote users, sets the default partition access to partition Common, the default role to no-access, and the default remote console access to disabled.

modify remote-user default-partition all default-role no access remote-console-access disabled

For all remote users, sets the default partition access to all partitions, the default role to no-access, and the default remote console access to disabled.

OPTIONS

default-partition
Specifies the default partition for all remote user accounts. The default value is all.

default-role
Specifies the default role for all remote user accounts. The default value is no-access.

description
Specifies a user-defined description.

remote-console-access
Specifies whether you are granting this user access to tmsh or disabling remote console access for this user. The default value is disabled.

SEE ALSO

auth remote-role, auth user, list, modify, show, tmsh

BIG-IP 2014-03-17 auth remote-user(1)

auth source

NAME

source - Configures the authorization source type for a BIG-IP(r) system.

MODULE

auth

SYNTAX

Configure the source component within the auth module using the syntax in the following sections.

MODIFY

modify source

options:

type [active-directory | ldap | local | radius | tacacs | cert-ldap | apm-auth]
fallback [true | false]

DISPLAY

list source

list source [option]

options:

all-properties
non-default-properties
one-line

DESCRIPTION

You can use the source component to set up the authorization source type for the BIG-IP system. The fallback setting enables system auth fallback from remote to local.

EXAMPLES

modify auth source type tacacs

Sets up the authorization source type as tacacs.

list auth source type

Displays the authorization source type.

OPTIONS

type Specifies the default user authorization source. The default value is local. When user accounts that access the system reside on a remote server, the value of the this option is the type of server that you are using for authentication, for example, ldap.

fallback
When true and type is set to a remote authentication source, if the remote server is unavailable, authentication will fall back to local authentication. The default value is false.

SEE ALSO
list, modify, tmsh

show running-config tacacs [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DELETE
delete tacacs [name]

DESCRIPTION
To authenticate BIG-IP system users when their authentication data is stored on a remote TACACS+ server, you create a TACACS+ configuration object, and then activate the object.

To configure TACACS+ authentication for BIG-IP system users:

1. Use the tacacs component in the auth module to configure a TACACS+ configuration object.
2. To activate TACACS+ authentication for BIG-IP system users, run the following command sequence: modify / auth source type tacacs

EXAMPLES
create tacacs bigip_tacacs_auth servers add {my_tacacs_server}
Creates a TACACS+ configuration object named bigip_tacacs_auth.
delete tacacs bigip_tacacs_auth
Deletes the TACACS+ configuration object named bigip_tacacs_auth.

OPTIONS

accounting

If multiple TACACS+ servers are defined and pluggable authentication module (PAM) session accounting is enabled, sends accounting start and stop packets to the first available server or to all servers. The default value is send-to-first-server.

Possible values are:

send-to-all-servers

The system sends accounting start and stop packets to all servers.

send-to-first-server

The system sends accounting start and stop packets to the first available server.

app-service

Specifies the name of the application service to which the TACACS+ configuration object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the TACACS+ configuration object. Only the application service can modify or delete the TACACS+ configuration object.

authentication

Specifies the process the system employs when sending authentication requests. The default value is use-first-server.

Possible values are:

use-all-servers

The system sends an authentication request to each server until authentication succeeds, or until the system has sent a request to all servers in the list.

use-first-server

The system sends authentication requests to only the first server in the list.

debug

Enables syslog-ng debugging information at the LOG DEBUG level. F5 Networks does not recommend this option for normal use. The default value is disabled.

description

User defined description.

encryption

Enables or disables encryption of TACACS+ packets. F5 Networks recommends this option for normal use. The default value is enabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which the component resides.

protocol

Specifies the protocol associated with the value specified in the service option, which is a subset of the associated service being used for client authorization or system accounting.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret

Sets the secret key used to encrypt and decrypt packets sent or received from the server. This option is required.

servers

Specifies the host name or IPv4 address of the TACACS+ server. For each server, a port may optionally be specified in the format hostname:port or IPv4:port. If no port is specified, the default port 49 is used. This option is required.

service

Specifies the name of the service that the user is requesting to be authenticated to use. Identifying the service enables the TACACS+ server to behave differently for different types of authentication requests. This option is required.

timeout Specifies the connect timeout in seconds. The default value is 10 seconds. Zero indicates no timeout.

auth user

NAME
user - Configures user accounts for the BIG-IP(r) system.

MODULE
auth

SYNTAX
Modify the user component within the auth module using the syntax shown in the following sections.

CREATE/MODIFY
create user [name]
modify user [name]
options:
description [text...]
partition-access [add | modify | delete | replace-all-with { [partition-name] { role [role-name] } }]
password [text]
prompt-for-password
shell [name]

where [role-name]: [acceleration-policy-editor | admin | fraud-protection-manager | application-editor | auditor | certificate-manager | firewall-manager | guest | irule-manager | manager | no-access | operator | resource-admin | user-manager | web-application-security-administrator | web-application-security-editor]

DISPLAY
list user
list user [[[name] | [glob] | [regex]] ...]
show running-config user
show running-config user [[[name] | [glob] | [regex]] ...]
options:
encrypted-password
one-line
partition
show user
options:
field-fmt

DELETE
delete user [name]

DESCRIPTION
You can create user accounts where the user names differ only by case-sensitivity (for example, david and DAVID).

You can configure the partition-access property to grant a user access to more than one partition on the system. In the case where you do not grant the user access to all partitions, you can assign the user a different user role for each partition. A user can have only one role per partition. Any user with a role of Administrator, Resource Administrator, Web Application Security Administrator, or Auditor always has access to all partitions and can have no other role on the system.

Only users with the Administrator or User Manager roles are allowed to create or modify user accounts.

Additionally, only users with the Administrator, Resource Administrator, or User Manager user role can view all of the user accounts in all of the partitions to which the user has access. Therefore, if you have a user role other than one of these roles, you can only view your own user account.

EXAMPLES
create user nwriters partition-access add { all-partitions { role guest } }
Creates a new user named nwriters with a role of Guest in all partitions.
create user tknox password aBcD007 partition-access add { partition1 { role operator } }
Creates a new user named tknox with a role of operator in partition named partition1 and sets the user's login password.
list user
Displays the viewable properties of all user accounts.
show user

Displays each user role and the corresponding partition access that is currently assigned to the user.

OPTIONS

description

Describes the user account in free form text.

encrypted-password

Displays the encrypted password for the user account.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

Note: User account names are case-sensitive.

partition

Displays the name of the administrative partition in which the user account resides.

partition-access

Specifies the administrative partitions to which the user currently has access. Note that in addition to these partitions, the user also has read access to the shared partitions Common and Root. An exception to this is any user with the role No Access.

role Specifies the user role that pertains to the partition specified by the partition-access property. If you do not want to assign a user role to the user account, specify the value no-access. This prevents the user from accessing the system.

password

Sets the user password during creation or modification of a user account without prompting or confirmation. May not be used with prompt-for-password. Passwords are hidden in log and history files.

prompt-for-password

Indicates that when the account is created or modified, the BIG-IP system prompts the administrator or user manager for both a password and a password confirmation for the account.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

shell

Specifies the shell to which the user has access. Valid values are:

bash Provides an unrestricted system prompt. You can assign access to the bash shell only to users with the Administrator or Resource Administrator role. However, F5 Networks recommends that you do not give bash shell access to users with the Resource Administrator user role unless they use the tcpdump, ssldump, or qkview utilities, or if they manage certificate and key files using the console. Instead, F5 Networks recommends that you give these users tmsh access.

none Specifies no shell access. The user must use the Configuration utility.

tmsh Provides access to the Traffic Management shell.

cli

cli admin-partitions

NAME

admin-partitions - Set the administrative partition for a BIG-IP(r)

configuration file.

MODULE

cli

SYNTAX

Configure the admin-partitions component within the cli module using the syntax in the following sections.

MODIFY

```
modify admin-partitions
options:
  update-partition [name]
```

DESCRIPTION

You can use the admin-partitions component to set the administrative partition in which configuration will be loaded when a configuration file is being loaded.

This component is only available from a configuration file that is being loaded via the sys config component with the file option.

EXAMPLES

```
cli admin-partitions { update-partition partition_A }
```

Sets the administrative partition in which configuration will be loaded. Configuration that follows this directive will be placed in partition_A.

OPTIONS

```
update-partition
Sets the administrative partition in which you can configure
objects.
```

SEE ALSO

load, sys config, tmsh

COPYRIGHT

BIG-IP 2017-06-26 cli admin-partitions(1)

cli alias private

NAME

private - Configures a user private alias.

MODULE

cli alias

SYNTAX

Configure the alias component within the cli alias module using the syntax in the following sections.

CREATE/MODIFY

```
create private [name]
options:
  command [commandSyntax]
  command ["command syntax"]
  command "[command syntax]; [command syntax]; ..."
  app-service [[string] | none]
  description [string]
```

```
edit private [name]
```

```
options:
  all
```

```
modify alias [name]
```

```
options:
  command [commandSyntax]
  command ["command syntax"]
  command "[command syntax]; [command syntax]; ..."
```

DISPLAY

```
list private
list alias [ [ [name] | [glob] | [regex] ] ...]
show running-config private
show running-config private [ [ [name] | [glob] | [regex] ] ...]
options:
  all-properties
  one-line
  non-default-properties
```

DELETE

```
delete private [all | [name ... name] ]
```

DESCRIPTION

You can use the private component to create a shortcut that runs a tmsh command sequence. The name of the private alias is what you type on the command line to run the command. If the command sequence for which you are creating an alias contains spaces, it must be enclosed in quotation marks. Command aliases are not case-sensitive.

You can create a private alias that runs multiple commands by entering the command sequences separated by semi-colons.

Private aliases can be used only by the user who created them.

When a batch mode transaction is active, commands that operate on the private component are run immediately and are not added to the transaction.

For more information about aliases, see the Traffic Management Shell (tmsh) Reference Guide.

EXAMPLES

```
create private save command "save config"
```

Creates an alias that saves the running configuration in the stored configuration files from anywhere within tmsh.

```
create private stats command "show /sys traffic"
```

Creates an alias that displays traffic statistics from anywhere within tmsh.

```
create private nodemonitor command "list /ltm node; list /ltm monitor"
```

Creates an alias that displays the Local Traffic Manager nodes and monitors.

```
create private myalias command "show /sys provision ; show /sys license"
```

Creates an alias that displays license and provisioning information.

```
create private ltmpool command "list /ltm pool"
```

Creates an alias that displays the Local Traffic Manager pools from anywhere within tmsh.

OPTIONS

command syntax

Specifies the command for which you are creating an alias. To create an alias that runs multiple commands, enter the command sequences separated by semi-colons.

app-service

Specifies the name of the application service to which the alias belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the alias. Only the application service can modify or delete the alias.

description

Specifies the purpose of the alias. If you enable cli preference show-aliases, tmsh displays the description in context-sensitive help (?).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a name for the alias. This is what you type in tmsh to run the command for which you are creating an alias.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

create, delete, edit, glob, list, modify, regex, show, shared, tmsh

COPYRIGHT

BIG-IP 2012-12-20 cli alias private(1)

NAME shared - Configures a shared alias.

MODULE cli alias

SYNTAX Configure the shared alias component within the cli alias module using the syntax in the following sections.

CREATE/MODIFY

```
create shared [name]
  options:
    command [commandSyntax]
    command ["command syntax"]
    command "[command syntax]; [command syntax]; ..."
    app-service [[string] | none]
    description [string]

edit shared [name]
  options:
    all

modify alias [name]
  options:
    command [commandSyntax]
    command ["command syntax"]
    command "[command syntax]; [command syntax]; ..."
```

DISPLAY

```
list shared
list alias [ [name] | [glob] | [regex] ] ...]
show running-config shared
show running-config shared [ [name] | [glob] | [regex] ] ...]
  options:
    all-properties
    one-line
    non-default-properties
```

DELETE

```
delete shared [all | [name ... name] ]
```

DESCRIPTION

You can use the shared component to create a shortcut to run a tmsh command sequence. The name of the shared alias is what you type on the command line to run the command. If the command sequence for which you are creating an alias contains spaces, it must be enclosed in quotation marks. Command aliases are not case-sensitive.

You can create a shared alias that runs multiple commands by entering the command sequences separated by semi-colons.

Shared aliases can be used by all users.

When a batch mode transaction is active, commands that operate on the shared component are run immediately and are not added to the transaction.

For more information about aliases, see the Traffic Management Shell (tmsh) Reference Guide.

EXAMPLES

```
create shared save command "save config"
```

Creates an alias that saves the running configuration in the stored configuration files from anywhere within tmsh.

```
create shared stats command "show /sys traffic"
```

Creates an alias that displays traffic statistics from anywhere within tmsh.

```
create shared nodemonitor command "list /ltm node; list /ltm monitor"
```

Creates an alias that displays the Local Traffic Manager nodes and monitors.

```
create shared myalias command "show /sys provision ; show /sys license"
```

Creates an alias that displays license and provisioning information.

```
create shared ltmpool command "list /ltm pool"
```

Creates an alias that displays the Local Traffic Manager pools from anywhere within tmsh.

OPTIONS

command syntax
Specifies the command for which you are creating an alias. To create an alias that runs multiple commands, enter the command sequences separated by semi-colons.

app-service
Specifies the name of the application service to which the alias belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the alias. Only the application service can modify or delete the alias.

description
Specifies the purpose of the alias. If you enable cli preference show-alias, tmsh displays the description in context-sensitive

help (?).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a name for the alias. This is what you type in tmsh to run the command for which you are creating an alias.

regex Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

BIG-IP 2015-12-28 cli alias shared(1)

cli global-settings

NAME

global-settings - Configures settings for tmsh

MODULE

cli

SYNTAX

Configure the global-settings component within the cli module using the syntax shown in the following sections.

MODIFY

```
edit global-settings
options:
  all-properties
  non-default-properties
```

modify global-settings

```
options:
  audit [disabled | enabled]
  description [string]
  idle-timeout [disabled | integer]
  scf-backup-number [integer]
  service [number | name]
```

DISPLAY

```
list global-settings
list global-settings [option]
options:
  all-properties
  non-default-properties
  one-line
```

DELETE

You cannot delete the default global settings.

DESCRIPTION

You can use the global-settings component to configure multiple settings for tmsh.

EXAMPLES

```
modify global-settings audit enabled
```

Enables auditing for tmsh.

```
modify global-settings idle-timeout 15
```

Sets the user idle timeout from tmsh to 15 minutes.

OPTIONS

audit

Specifies the global audit level for tmsh. The audited commands are stored in /var/log/audit. The default value is enabled. The audit levels are:

disabled

tmsh does not log commands that users enter.

enabled

tmsh audits only commands that users enter. Note that the system does not audit the commands that the command load runs.

description
User defined description.

idle-timeout
If not disabled, log a user in tmsh interactive mode out automatically after a specified set of minutes. An administrator may change the timeout value at any time and the new policy will take place immediately.

scf-backup-number
Specifies the number of backup single configuration files that the system stores when you enter the following command sequence in tmsh:

```
load sys config file
```

When you run the command, the system saves the single configuration file. By default, the system saves two backup single configuration files. For example, if you set the scf-backup-number option to 3, after you run the command sequence tmsh load sys config file for the third time, the system has three versions of the single configuration file: /var/local/scf/backup.scf, /var/local/scf/backup-1.scf, and /var/local/scf/backup-2.scf. The newest file is /var/local/scf/backup.scf.

service
Specifies the format in which tmsh displays a service. The default value is name. The options are:

name Displays a service using a protocol name, for example, http.

number
Displays a service using a numeric value, for example, 192.168.10.20:80, where 80 indicates http.

SEE ALSO
edit, list, modify, run, tmsh

BIG-IP 2016-03-14 cli global-settings(1)

cli history

NAME
history - Displays a list of commands in the order in which you ran the commands.

MODULE
cli

SYNTAX
Use the history component within the cli module to display a numbered list of commands in the order the commands were issued.

```
DISPLAY  
show history  
!  
!!  
![string]
```

DESCRIPTION
You can use the history component to display a numbered list of the commands that you have run in tmsh. The commands display in the order in which you ran the commands, and each command is identified by an entry ID. The larger the entry ID of the command, the more recently you ran the command.

To rerun a command from the history list, type q to close the list and return to the tmsh prompt, and then enter an exclamation point (!) followed by the entry ID of the command that you want to run.

EXAMPLES
!

```
show history
```

Either of the two previous commands, displays the command history list.

```
!5
```

Runs the fifth command in the command history list.

!!

Runs the previously issued command.

!create

Runs the last command that begins with create.

SEE ALSO

show, tmsh

warn [bell | disabled | visual-bell]

edit preference

options:

all-properties

DISPLAY

list preference

list preference [option]

show running-config preference

show running-config preference [option]

options:

all-properties

one-line

DESCRIPTION

You can use the preference component to configure tmsh to meet your specific needs.

EXAMPLES

modify preference display-threshold 500

Configures tmsh to retrieve up to 500 objects before requiring a user response to the question, "Display all items? (y/n)."

modify preference history-file-size 80

Configures the maximum number of commands that a user can view in the command history list to be 80.

modify preference history-size 1000

Configures the maximum number of commands that tmsh saves in a user's .tmsh_history file to be 1000 commands.

modify preference suppress-warnings config-version

Configures tmsh to suppress warning messages for configuration version related (for backward compatibility of configuration).

OPTIONS

alias-path

Specifies the search paths for shared aliases. The shared aliases could be in multiple locations, only ones on the search paths can be used. If a folder is deleted from the system it will be automatically remove from the alias-path.

app-service

Specifies the name of the application service to which the preference belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the preference. Only the application service can modify or delete the preference.

confirm-edit

Specifies whether the command edit prompts for confirmation before saving changes. The default value is enabled.

Note that the value of this option does not affect the behavior of the editor if the changes made in the editor result in a failed update. In this case, tmsh always prompts the user to either re-edit the file or discard the changes. The options are:

enabled

tmsh prompts a user to either submit (y), discard (n), or edit (e) the changes made to a component within the editor.

disabled

tmsh does not prompt the user, but instead, immediately submits the changes made in the editor.

display-threshold

Specifies the maximum number of objects that tmsh displays without requiring a user response to the question, "Display all [number] items? (y/n)." You can specify from 0 (zero) through 4,294,967,265 objects. If you set this option to 0 (zero), tmsh displays an unlimited number of objects without requesting a response.

editor

Specifies the editor that the command edit invokes. Users assigned the user role of Administrator can select nano or vi. Users assigned other user roles must use nano.

history-date-time

Specifies whether tmsh displays in the command history the date and time that each command was issued. The default value is disabled.

Note that the command history file, ~/.tmsh-history-[user], always contains the date and time that a command was issued.

history-file-size

Specifies the maximum number of tmsh commands that the system saves in each user's .tmsh_history file. If you set this option to 0 (zero), the system does not save tmsh commands in the file. The maximum value is 100,000. For performance reasons, the system does not truncate the file after a user enters a command. Instead, the system truncates the file after a user exits tmsh.

history-size

Specifies the number of commands that a user can view or search in the command history list. The maximum number of commands is 100,000. The default value is 500.

If you set this option to 0 (zero), the system does not add commands to the list of commands in memory; however, the system does write commands to the .tmsh_history file, unless the history-file-size option is set to 0 (zero).

When you change the value of this option, the system rennumbers the commands listed in memory; however, the commands remain in the same order.

keymap

Specifies the keyboard bindings that you want tmsh to use. The default value is default. The options are default, emacs, and vi.

list-all-properties

Specifies whether the system displays all of the properties of a component by default when you run the command list. The default value is disabled.

pager

Specifies whether the system sends the output of the tmsh commands list and show to less. The default value is enabled.

prompt

Specifies the information that you want to display in the tmsh prompt. By default the prompt displays user_name@host_name(tmos-current_module)#. The options are:

avc-count

Displays the current SELinux Access Vector Cache in the tmsh prompt. The value displayed in the prompt indicates the number of times SELinux has denied access to a protected

resource. The default is to not display this information.

config-sync-status
Displays global sync status in the tmsh prompt. The status displayed in the prompt indicates the rolled-up sync status of all the device groups where the local device resides. The default is to display this information.

current-folder
Displays the current working folder in the tmsh prompt. The default is to not display this information.

fully-qualified-host
Displays the fully qualified host name in the tmsh prompt. The default is to not display this information.

host Displays the host name in the tmsh prompt. The default is to display the host name in the prompt.

mcp-load-status
Displays the configuration file load status in the tmsh prompt. This information is also available in the Last Configuration Load Status of the show sys mcp command output. The default is to not display this information.

mcp-state
Displays the running phase of the mcpd service in the tmsh prompt. This information is also available in the Running Phase of the show sys mcp command output. The default is to not display this information.

multi-line
Displays the tmsh prompt on multiple lines, with information on the first line, and a pound sign (#) on the second line, for example:

```
(Common:all) operator1@6400(tmos.cli)
```

```
#
```

The multi-line option is disabled by default.

none Sets the tmsh prompt to display (tmos.current_module)#, where the system replaces current_module with the name of the module within which you are working.

status
Displays the system status in the tmsh prompt. The default is to display system status in the prompt.

user Displays the user name in the tmsh prompt. The default value is to display the user name in the prompt.

user-role
Display the user's current role in the tmsh prompt. By default the user role is not displayed in the prompt.

show-aliases
Specifies whether the system displays aliases in the results of the command completion and context-sensitive help features. The default value is enabled.

suppress-warnings
Specifies the type of warning messages which needs to be suppressed. The default value is none.

stat-units
Specifies the default unit in which the system displays statistics. The options are:

default
Displays data in the simplest units. For example, if the value of the data is 1,200,001, the system displays 1.20M; however, if the value of the data is 1,200, the system displays 1.2K.

exa Display data in parts per quintillion.

gig Displays data in parts per billion.

kil Displays data in parts per thousand.

meg Displays data in parts per million.

peta Displays data in parts per quadrillion.

raw Displays raw data.

tera Displays data in parts per trillion.

yotta
Displays data in parts per septillion.

zetta
Displays data in parts per sextillion.

table-indent-width
Specifies the indent width when tmsh displays the child object tables in a show command. You can specify from 0 (zero) through 10. If you set this option to 0 (zero), tmsh displays child object tables without any indent.

tcl-syntax-highlighting
Specifies whether Tcl syntax highlighting will be enabled in the

editor. This setting only applies if your editor preference is set to vi. The default value is disabled.

video

Enables or disables any video features used to highlight text. The default value is enabled.

warn Specifies how the system warns you when you make an incorrect keystroke. The default value is bell.

The options are:

bell Sounds a bell.

disabled

Disables the warning function.

visual-bell

Displays a visual warning.

verbatim-arguments [file option] [file name] [options ...]

The options that are available depend on which script you are running.

The file option is limited to users with the role of administrator.

DESCRIPTION

You can use the script component to build Tcl scripts to automate management of the BIG-IP(r) system. By combining command aliases with scripts, you can extend tmsh to build commands that are customized to your environment.

To do this, place the content of the script inside one or more Tcl procedures. The content of a script cannot exceed 65,000 bytes. However, a script can include other scripts. For more information about including scripts in other scripts, see `tmsh::include` following.

Starting with BIGIP 11.5.0, tmsh commands are versioned. The tmsh active version should be specified in scripts. This will avoid breaking scripts due to changes in tmsh syntax in the different versions. See examples below for how to use it in a script. Without tmsh active version specified, scripts will run on the current active version. By default, the active version will be the latest cli version.

You can use the following procedures in the manner specified:

`script::run`

tmsh invokes the procedure `script::run` when you issue the command sequence `run / cli script [name]`. A script is run relative to the module in which the run command is invoked.

The `script::run` procedure must be defined in the script named by the run command. Scripts that are included by `tmsh::include` are not required to implement the procedure `script::run`.

`script::help`

Provides context sensitive help. A script is not required to implement `script::help`.

`script::tabc`

Provides context sensitive help. A script is not required to implement `script::tabc`.

`script::init`

tmsh calls the procedure `script::init` before calling one of the following procedures: `script::run`, `script::help`, or `script::tabc`. The `script::init` procedure can use the Tcl variable `tmsh::csh` to determine which one of these three procedures tmsh invokes after `tmsh:init`.

Additionally, you can use the procedure `script::init` to initialize global variables. A script is not required to implement `script::init`.

EXAMPLES

```
edit script myscript
```

Creates or modifies the script myscript.

```
edit script myscript yourscrip
```

Creates or modifies the scripts myscript and yourscrip at the same time.

```
list script myscript
```

Displays the contents of the script myscript.

```
delete script [name]
```

Deletes the script myscript from the system.

```
run script myscript [arguments ...]
```

Runs the script myscript. The system passes arguments to the script in the following Tcl variables:

- o `tmsh::argc` contains the number of arguments including the name of the script.

- o `tmsh::argv` contains the list of argument values. The first item in `tmsh::argv` is always the name of the script.

Tip: You can create an alias for the command sequence `run / cli script [name]` using the cli alias component. For more information, see `help cli alias`.

```
run script verbatim-arguments myscript [arguments ...]
```

Runs the same commands as `run script myscript [arguments...]` above, except the system passes all arguments specified in the command as one argument to the script. Note that you do not need to enclose the argument list in double quotes, and you do not need to escape special characters.

```
generate my_script checksum
```

Generate a checksum for the script text and add the checksum as a property.

```
generate my_script signature signing-key my_key
```

Generate a signature for the script text using the specified private key and add the signature as a property.

Note: For a script which includes a checksum or signature to successfully load, the script text contents must match the stored checksum or signature. To temporarily stop the verification of signature or checksum and still retain the checksum or signature, the `ignore-verification` attribute must be set to true. This is done by

editing the script and adding the ignore-verification attribute.

To completely clear the signature or checksum, simply set the attribute script-signature or script-checksum to empty string "". By doing so, the script will be processed as if it was never signed or checksummed.

```
modify script /Common/my_script { proc script::init {} { }  
  
proc script::run {} { }  
  
proc script::help {} { }  
  
proc script::tabc {} { }  
ignore-verification true  
script-checksum 74778e7b13016e0b9329a17f8d2da601  
total-signing-status checksum  
verification-status checksum-verified }
```

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

checksum

Generate a checksum for the script text and add the checksum to the script as a property. Only for use with the generate command.

description

A user defined description.

file Specifies that the script to be run should come from a file located on the file system rather than a script from the configuration.

glob Displays the scripts that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the script. This option is required for the edit and delete commands.

regex

Displays the scripts that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

signature

Generate a signature for the script text using the specified private key and add the signature to the script as a property. Only for use with the generate command.

signing-key

The private key to use for signing the script. Only for use with the signature option.

verbatim-arguments

Specifies that the arguments at the end of the command should not be tokenized by tmsh prior to being sent to the script. This is useful when the script is wrapping another utility that takes arguments.

CONFIGURATION AND STATUS ACCESSORS

The following Tcl commands mirror tmsh commands. For example, the Tcl tmsh::create command accepts the same components, object identifiers, and properties that the tmsh create command accepts.

tmsh::cd [args...]

Runs the cd command using the specified arguments.

tmsh::cp [args...]

Runs the cp command using the specified arguments.

tmsh::create [args...]

Runs the create command using the specified arguments.

tmsh::delete [args...]

Runs the delete command using the specified arguments.

tmsh::install [args...]

Runs the install command using the specified arguments.

tmsh::generate [args...]

Runs the generate command using the specified arguments.

tmsh::list [args...]

Runs the list command using the specified arguments. The system returns the results as a string.

tmsh::load [args...]

Runs the load command using the specified arguments.

tmsh::modify [args...]

Runs the modify command using the specified arguments.

tmsh::publish [args...]

Runs the publish command using the specified arguments.

tmsh::pwd

Runs the pwd command.

`tmsh::reset-stats [args...]`
Runs the `reset-stats` command using the specified arguments.

`tmsh::restart [args...]`
Runs the command `restart` using the specified arguments.

`tmsh::run [args...]`
Runs the `run` command using the specified arguments.

`tmsh::save [args...]`
Runs the `save` command using the specified arguments.

`tmsh::show [args...]`
Runs the `show` command using the specified arguments. The system returns the results as a string.

`tmsh::start [args...]`
Runs the command `start` using the specified arguments.

`tmsh::stop [args...]`
Runs the command `stop` using the specified arguments.

The following Tcl commands provide structured access for retrieving configuration, statistics, and status information.

`tmsh::get_config [args...]`
Returns a list of Tcl objects. Each of these objects can be passed to the commands that accept an `$obj` argument. The arguments for this command are the same as for the `tmsh list` command.

`tmsh::get_status [component] [args...]`
Returns a list of Tcl objects that can be passed to the following commands that accept an `$obj` argument. The arguments to this command are the same as the `tmsh show` command.

This command can only be used on components that accept the `field-fmt` option. The `field-fmt` option is automatically appended to the argument list. The `tmsh` help pages identify if a component supports the `field-fmt` option.

That there are very few components that have status and statistics that do not support the `field-fmt` option, and in those cases you can use the Tcl `tmsh::show` command to retrieve the object in the form of a Tcl string object.

A component must be specified, for example, `tmsh::get_status ltm pool`.

`tmsh::get_type $obj`
Returns the type identifier associated with the object. The `$obj` argument must be an object that was returned by either of the Tcl `tmsh::get_config` or `tmsh::get_status` commands.

`tmsh::get_name $obj`
Returns the object identifier associated with the object. The `$obj` argument must be an object that was returned by either of the Tcl commands `tmsh::get_config` or `tmsh::get_status`.

`tmsh::get_field_names [value | nested] $obj`
Returns a list of field names (not the value associated with a field) that are present in an object. The value fields are simple values or lists (for example, an integer or a string). The nested fields are a collection of zero or more nested objects, where the nested objects have their own fields (for example, pool members, and virtual server profiles).

The `$obj` argument must be an object that was returned by the Tcl `tmsh::get_config` or `tmsh::get_status` commands. If the object was retrieved using the Tcl `tmsh::get_config` command, the field names are identical to those that are displayed by the `tmsh list` command. If the object was retrieved using the Tcl `tmsh::get_status` command, the fields are identical to those that the system displays using the `tmsh show` command with the `field-fmt` option.

`tmsh::get_field_value $obj [field name] [Tcl variable]`
Retrieves the value of field name.

The Tcl variable is optional. The behavior of this command depends on whether field name is present in `$obj` and a Tcl variable is present in the command.

- o If field name is present in `$obj`, and a Tcl variable is present, the Tcl variable is set to the value of field name and the command returns 1.
- o If field name is not present in `$obj`, and a Tcl variable is present, the command returns 0 (zero).
- o If field name is present in `$obj`, and a Tcl variable is not present, the command returns the field value.
- o If field name is not present in `$obj`, and a Tcl variable is not present, the command raises an error that causes the script to stop. You can use the Tcl command `catch` to recognize the error and continue to run the script.

The `$obj` argument must be an object that was returned by the Tcl `tmsh::get_config` or `tmsh::get_status` commands, or a nested object obtained from the Tcl `tmsh::get_field_value` command.

If the field is a set of nested objects, the Tcl object that the system returns is a list of objects, where each of the objects can contain fields. Each of the objects can be passed to the Tcl

tmsh::get_field_value command. If the field is not a nested object the system returns a single Tcl string object.

TRANSACTION CONTROL

The following Tcl commands are specific to the tmsh Tcl API. There are no corresponding commands available in tmsh.

tmsh::begin_transaction

Begins an update transaction. The Tcl tmsh::create, tmsh::delete, and tmsh::modify commands that are issued before the next Tcl tmsh::commit_transaction command are submitted as a single update.

The system rolls back all of the commands if any of the commands fail.

tmsh::commit_transaction

Runs the commands that have been issued since the last Tcl tmsh::begin_transaction command. The system validates all of the commands against the running configuration. If any one of the commands fail, the system does not apply any of the commands to the running configuration.

tmsh::cancel_transaction

Cancels all commands that you have issued since the last Tcl tmsh::begin_transaction command.

Important: You cannot use these Tcl commands inside an active transaction:

- o tmsh::list
- o tmsh::show
- o tmsh::get_config
- o tmsh::get_status

LOGGING

You can use the following Tcl commands to generate log events. These commands affect the behavior of the script and do not affect tmsh. These commands are available only to users who have been assigned either the Administrator or Resource Administrator role.

tmsh::log_dest [screen | file]

Specifies whether the system sends events to the screen or to log files. If file is selected, log messages will be directed to /var/log/ltn.

tmsh::log_level [level]

Specifies the default severity level. The system does not log events below the specified level. The options, listed in decreasing order of severity, are:

- o emerg
- o alert
- o crit
- o err
- o warning
- o notice
- o info
- o debug

tmsh::log [level] "message..."

Logs the specified message. The level parameter is optional. The level can be one of those described in the Tcl tmsh::log_level command.

CUSTOM ISTATS

Custom counter, gauge, and string fields may be created, modified, and retrieved using iRules or tmsh scripts. These custom fields are created on first write and do not need to be declared separately.

Each custom field has a "key" that can be associated with a tmsh configuration object. This key is composed of a tmsh component dotted path, a specific object name or ID, the field type, and the field name. The entire key must be enclosed in quotes.

For example, "ltn.pool /Common/my_pool counter num_hits" refers to the num_hits counter associated with the LTM pool named my_pool, located in the Common folder.

These custom fields are displayed with the tmsh show command on the associated object.

istats::incr [key] [amount]

Increments a custom counter by amount.

istats::set [key] [value]

Sets a custom gauge or string to value. Setting a counter to an exact value will only set it in the local segment, but istats::get will always read the aggregated (not local) value.

istats::get [key]

Returns the latest aggregated value of the custom field or 0 (zero) if it does not exist (" for string fields).

istats::remove [key]

Removes the custom field from all segments on all blades.
Effectively resets a counter to 0.

UTILITIES

The following commands are TCL utility commands.

`tmsh::clear_screen`

Clears the screen and places the cursor at the upper left of the screen.

`tmsh::display [variable | command output]`

Provides access to the tmsh pager. Output generated with the Tcl puts command is not paged.

`tmsh::display_threshold [integer]`

When a script is run, the system disables the option cli preference display-threshold.

You can use the Tcl `tmsh::display_threshold` command to re-enable the threshold. Re-enabling the threshold in this way causes the script to generate a prompt if you issue the `tmsh::list`, `tmsh::show`, `tmsh::get_config`, or `tmsh::get_status` commands, and the output that is generated exceeds the threshold. See help cli preference for a description of this option and valid ranges for its value.

`tmsh::expand_macro [macro_text] options...`

Expands a macro and returns the resulting string. A macro is a string containing macro syntax which can be used for parameter substitution, script and iRule templatization, etc. The Macro Syntax includes the following delimiters:

`<%` The beginning of an expansion code block.

`<%=` The beginning of an expansion code block. Spool the output after evaluating.

`<%D[0-9][0-9]` The beginning of a debug/logging code block with the debug threshold set to 0 thru 99.

`<%D[0-9][0-9]=` The beginning of a debug/logging code block with the debug threshold set to 0 thru 99. Spool the output after evaluating.

`%>` The end of the current block (works for all types).

Typically, the result of the `expand_macro` command is used as the input to another command (eg. ltm rule create). The command can be called multiple times within an iApp implementation to expand multiple macros.

`macro_text` is the blob of text to expand. If not specified, the command will expand the Macro section of the iApp. If no `macro_text` argument is specified and no Macro section exists for the iApp, an error will be issued.

`-vars name_value_pair_list`

Specifies a list of additional variables (name/value pairs) which can be referenced within the macro and expanded by the command. All APL variables are automatically available from within the macro, so the `-vars` option allows a way to specify additional variables from the iApp Implementation section. Since the variables are defined within a Tcl list the format is: { name1 value1 name2 ... nameN valueN }

`-debug debug_levels`

Specifies a single debug level or list of debug levels for controlling which debug messages get rendered in the expanded output.

`-debuginclusive debug_level`

Specifies a debug level for controlling which debug messages get rendered in the expanded output. Since it's "inclusive" all messages with a level at the specified level and below will get rendered in the expanded output.

The following example expands the macro defined in the Macro section of the iApp, and sets the debug level to render all debug messages with a level of 11, 33 or 66:

```
tmsh::expand_macro -debug {11 33 66}
```

The following example expands the macro defined via a Tcl variable (`mac`), adds two variables (`foo` and `enable_mything`), and sets the debug level to render all messages of level 66 and below:

```
tmsh::expand_macro $mac -vars {foo bar enable_mything true}  
-debuginclusive 66
```

`tmsh::get_ifile_text [iFile name]`

Retrieve the text contained in the specified text iFile. When used on an iFile containing characters which are non-ascii or are not printable/space, an error will be returned.

`tmsh::include [script name]`

Runs the Tcl eval command on the specified script. The system evaluates the script at a global level, and all procedures in the included script are available to any other procedure. You must have previously created the script that is being included using the `tmsh edit / cli script [name]` command. If a full path is not

given for the script name, tmsh will attempt to first locate the script from the same folder as the including script, then the root partition folder of the including script, and finally the /Common folder.

`tmsh::run_proc [script_name:proc_name] options...`
Runs the Tcl eval command on the specified script and process. The script `script_name` is loaded as if `tmsh::include` was called. After the script is loaded, the Tcl eval command is run on the specified Tcl process. Any options that were specified are passed to the Tcl process. This is essentially a short form of running `tmsh::include script_name`, followed by running one of the Tcl processes contained in the script that was included.

The following example invokes the `display_pool_status` proc that is contained in the `pool_utils` script:

```
tmsh::run_proc pool_utils:display_pool_status
```

```
tmsh::stateless [disabled | enabled]
```

Modifies the behavior of `tmsh::create` and `tmsh::delete`.

When `stateless` mode is disabled, an attempt to create an object that already exists in the configuration results in an error, and an attempt to delete an object that does not exist in the configuration is an error.

When `stateless` mode is enabled, an attempt to create an object that already exists in the configuration does not result in an error, and an attempt to delete an object that does not exist in the configuration does not result in an error.

Enabling `stateless` mode enables scripts to successfully run multiple times with the same input.

The default value is disabled.

```
tmsh::version
```

Returns the version number of the BIG-IP system as a Tcl string. The version consists of three digits: a major, minor, and maintenance version, separated by periods. For example, 10.1.0 indicates minor version 1 of major version 10.

CONTEXT SENSITIVE HELP

Use the following commands to create a script that provides context sensitive help when a user types Tab or question mark (?).

```
script::help
```

Scripts can provide the `script::help` procedure. tmsh invokes the procedure when a user types a question mark (?) while entering the command sequence `run / cli script [name]`. If the specified script includes the `script::init` procedure, tmsh invokes it before the `script::help` procedure. The script can add context sensitive help by calling the `tmsh::add_help` and `tmsh::builtin_help` procedures. tmsh formats the help and displays it.

```
script::tabc
```

Scripts can provide the `script::tabc` procedure. The system invokes this procedure when the user types Tab while entering the command sequence `run / cli script`. If the `script::init` procedure is included in the script, that procedure is invoked before the `script::tabc` procedure. The script can add tab completion datasets to the script by calling the `tmsh::add_tabc` and `tmsh::builtin_tabc` procedures. tmsh either formats and displays the tab completion datasets, or if possible, completes the current argument.

```
tmsh::csh
```

`tmsh::csh` is a Tcl string variable that can be used in the `script::init` procedure to determine the context in which the `script::init` procedure was invoked.

`tmsh::csh` is set to one of the following:

question mark (?)
Indicates that the user typed a question mark (?).

TABC Indicates the user pressed the Tab key.

an empty string ""
Indicates the script is being run.

```
tmsh::add_help [ [category item description] | [description] ]
```

Displays context sensitive help when the user types a question mark (?). If you supply one argument, that argument displays as-is with no formatting applied to the description.

If you supply three arguments, one or more datasets are constructed. The first argument is the name of the dataset. The second argument is an item in the dataset. The third argument is a description of the item. This command has an effect only if the Tcl `tmsh::csh` variable is set to question mark (?).

```
tmsh::builtin_help ["tmsh command" args...]
```

Presents the same results as typing a question mark (?) while entering a tmsh command. The system stores a set of possible completions and displays the possibilities when the `script::help` procedure returns. This command has an effect only if the Tcl `tmsh::csh` variable is set to question mark (?).

```
tmsh::add_tabc [ [category item] | [item] ]
```

Adds tab completion datasets. If you supply one argument, the system adds that argument to an anonymous dataset. If you supply two arguments, the system constructs one or more datasets. The first argument is the name of the dataset. The second argument is

an item in the dataset. Potential completions are displayed in groups based on category. This command has an effect only if the Tcl `$tmsh::csh` variable is set to `TABC`.

```
tmsh::builtin_tabc ["tmsh command" args...]
```

Many of the `tmsh` commands that are available for scripting are also available in the interactive shell. A script can use the `tmsh::builtin_tabc` command to present the same tab completion results as a built-in command. The command does not return a value. The set of possible completions are stored internally and displayed when the `script::tabc` procedure returns. This command has an effect only if the Tcl `$tmsh::csh` variable is set to `TABC`.

THIRD PARTY TCL LIBRARY USAGE

A selection of third party libraries have been tested to work within the CLI script environment, including MD5, BASE64, SHA1/SHA256, HTTP, TLS, TCL Perl, LDAP client, and XML parser. The TCL packages can only reside in the directory of `/usr/share/compat-tcl8.4`.

Important: Only these tested packages are supported currently.

This example demonstrates the use of a Tcl package command to make use of `tls/https`. The TLS package is installed in the directory `/usr/share/compat-tcl8.4/tls` in the form of two files: `tls.tcl` and `libtls1.6.1.so`.

```
Modify script /Common/use_tls {
```

```
proc script::run {} {
    set pkg_name tls
    set pkg_version 1.6
    package require http
    if {[catch {package require $pkg_name $pkg_version}]} {
        puts "No package found: $pkg_name!\n"
    } else {
        puts "Found package: $pkg_name!\n"
        http::register https 443 tls::socket
        set token [http::geturl https://172.27.42.161/]
        upvar #0 $token state
        puts $state(http)
        puts $state(body)
    }
}
```

This example uses the callback function to handle http data.

```
cli script /Common/use_http2 {
proc script::httpCallback {token} {
    upvar #0 $token state
    puts $state(http)
    puts $state(body)
    incr ::got_something
}
proc script::run {} {
    namespace eval :: {
        set got_something 0
    }
    set pkg_name http
    set pkg_version 2.4.5
    if {[catch {package require $pkg_name $pkg_version}]} {
        puts "No package found: $pkg_name!\n"
    } else {
        puts "Found package: $pkg_name!\n"
        http::geturl http://172.27.42.22/index.htm -command script::httpCallback
        vwait ::got_something
    }
}
```

This example uses the LDAP client package to query data.

```
cli script /Common/use_ldap {
proc script::run {} {
    set pkg_name ldap
    if {[catch {package require $pkg_name 1.8}]} {
        puts "No package found: $pkg_name!\n"
    } else {
        puts "Found package: $pkg_name!\n"
        set handle [ldap::connect 172.27.1.2]
        ldap::bind $handle
        set results [ldap::search $handle "dc=f5,dc=com" "(uid=test)" {}]
        foreach result $results {
            puts $result
        }
        ldap::unbind $handle
        ldap::disconnect $handle
    }
}
```

Here are some additional examples:

```
cli script /Common/use_parray {
proc script::run {} {
    puts [info patch]
    namespace eval :: {
        set pkg_location /usr/share/compat-tcl8.4/
        source [file join $pkg_location package.tcl]
    }
    puts "NS: [namespace current]"
    set pkg_location $::pkg_location
    source [file join $pkg_location parray.tcl]
    parray ::tcl_platform
}
```

```

}
}
cli script /Common/use_sha2 {
proc script::run {} {
set pkg_name sha256
if {[catch {package require $pkg_name}]} {
puts "No package found: $pkg_name!\n"
} else {
puts "Found package: $pkg_name!\n"
puts "TCL does SHA2 now:"
puts [sha2::sha256 "TCL does SHA2"]
}
}
}

cli script /Common/use_tclperl {
proc script::run {} {
set pkg_name tclperl
if {[catch {package require $pkg_name}]} {
puts "No package found: $pkg_name!\n"
} else {
puts "Found package: $pkg_name!\n"
set interpreter [perl::interp new]
$interpreter eval {print "Hello World\n"}
perl::interp delete $interpreter
}
}
}
}

```

SPECIAL CHARACTERS

There are several characters that are part of both Tcl and tmsh syntax. You must escape these characters in a shell script so that Tcl passes them to tmsh. You can use standard Tcl escape characters, such as quotes and back slashes. You must escape curly braces (`{ }`), for example, `"{ " }`".

```
tmsh::create ltm pool my_pool members add "{ 10.1.2.3:80 }"
```

Creates a Local Traffic Manager pool named `my_pool`.

DISABLED COMMANDS

The following commands are disabled for users that have not been assigned a user role of Administrator or Resource Administrator:

- o auto_execok
- o auto_import
- o auto_load
- o auto_mkindex
- o auto_mkindex_old
- o auto_qualify
- o auto_reset
- o bgerror
- o cd
- o close
- o eof
- o exec
- o fblocked
- o fconfigure
- o fcopy
- o file
- o fileevent
- o filename
- o flush
- o glob
- o http
- o interp
- o load
- o memory
- o open
- o package
- o pid
- o pkg:create
- o pkg_mkindex
- o pwd

- o seek
- o socket
- o source
- o tcl_findLibrary
- o tell
- o unknown
- o updates
- o vwait

EXAMPLES

The following example demonstrates the use of all tmsh Tcl commands. The script displays all configuration property values or all status and statistic values for the specified component, depending on the specified arguments. The system displays all configuration settings if you replace [tmsh::get_config \$comp all-properties] with [tmsh::get_config / all-properties]. The use of the all-properties option ensures that all options are displayed.

This command sequence is an example of how to run the following script:
run / cli script example.tcl config ltm pool.

```
cli script example.tcl {
    proc script::init { } {
        set ::field_fmt "%-25s %s"
        set ::usage_string "usage: [lindex $tmsh::argv 0] \
            "
    }

    proc script::help { } {
        if { $tmsh::argc < 2 } {
            tmsh::add_help Options: config "Display configuration"
            tmsh::add_help Options: status \
                "Display status and statistics"
        }
        else {
            build_csh tmsh::builtin_help
        }
    }

    proc script::tabc { } {
        if { $tmsh::argc < 2 } {

}
return $args
}

proc usage { } {
puts $::usage_string
exit
}
}

```

EXAMPLES

The following example demonstrates the scripts using 11.6.0 tmsh syntax.

```

cli script example_ver.tcl {
...
proc script::run {} {
    tmsh::modify cli version active 11.6.0
    # the tmsh command in the section below should contain 11.6.0 tmsh syntax
    puts stdout [tmsh::list ltm pool mypool]
    ...
}
}

```

The following example demonstrates the scripts that are using multiple tmsh syntaxes.

```

cli script example_multi_ver.tcl {
....
proc script::run {} {
    tmsh::modify cli version active 11.5.0
    # the tmsh command in the section below should contain 11.5.0 tmsh syntax
    puts stdout [tmsh::list ltm pool mypool]
    ...

    tmsh::modify cli version active 11.6.0
    # the tmsh command in the section below should contain 11.6.0 tmsh syntax
    puts stdout [tmsh::list ltm pool mypool]
    ...
}
}

```

cli transaction

NAME
transaction - Opens batch mode within which you can submit a set of commands as a single transaction.

MODULE
cli

SYNTAX
Use the transaction component within the cli module to open batch mode, enter a series of commands, and then submit the commands as a single transaction.

CREATE/MODIFY
create transaction

modify transaction
options:
delete [entry_id]

submit transaction [validate-only]

DISPLAY
list transaction

DELETE
delete transaction

DESCRIPTION
tmsh parses each command that you enter in batch mode. If the command passes a syntax check, tmsh saves it as part of the transaction you are creating and returns a confirmation. After you finish adding commands, you submit the transaction to change the running configuration of the system. You must run the save config command to save the changes to the stored configuration files.

If, while creating a transaction, you decide you do not want to change the running configuration, you can delete the transaction rather than submit it. However, you can recreate a transaction that you have deleted by using the cli history component.

There are a few commands that you can enter on the command line that the system immediately runs, rather than adding the commands to a transaction. These commands are list and show. Additionally, tmsh immediately runs the command sequence run bigpipe, but does not add it to the transaction.

EXAMPLES
The following example shows the commands that you enter from within the ltm module to create and submit a transaction that creates a Local Traffic Manager pool and virtual server, and then associates the two.

1. Open tmsh batch mode:
create /cli transaction
2. Add a command to the transaction that creates pool1 for the Local Traffic Manager using the default values for a pool:
create pool pool1
3. Add a command to the transaction that creates the virtual server virtuall for the Local Traffic Manager using the default values for a virtual server, and associates it with pool1.
create virtual virtuall pool pool1
4. Display, in a numbered list, the current set of commands in the transaction:
list /cli transaction

Note: You can use the preceding command to determine the entry ID of a command. Then, you can use this ID to remove or replace a command in the transaction, or to identify a command before which you want to insert another command.

5. Submit the transaction:
submit /cli transaction

OPTIONS
command
Specifies, in quotation marks, the full path to a command to add to or delete from the transaction that you are creating. You can also replace an existing command with another command or insert a command before a command in the transaction.

create
Opens batch mode.

delete
Deletes the transaction that you are creating and closes batch mode.

list
Displays, in a numbered list, the current set of commands in the transaction that you are creating.

modify
Specifies a previously entered line in the transaction that you want to change. The options are:

delete
Deletes the specified entries from the transaction that you are creating.

entry_id
Specifies the number of a command in the list of commands in the transaction that you want to delete.

submit [validate-only]
Submits the transaction that you are entering and closes batch mode. The transaction is submitted in the context of the cli admin-partitions settings that are active when the submit command is issued.

validate-only
Validates the configuration changes without putting them in production.

SEE ALSO

cli version

NAME
version - Displays and Configures tmsh versions.

MODULE
cli

SYNTAX
Configure the version component within the cli module using the syntax shown in the following sections.

MODIFY
modify version [option]
options:
active [string]

DISPLAY
show version

DESCRIPTION
You can use the version component to configure tmsh to run the specified version.

EXAMPLES
modify cli version active 11.5.0
Configures tmsh run 11.5.0 version.
show cli version
Displays the latest, active and supported versions of TMSH.

OPTIONS
active
Specifies the active version of TMSH.
latest
Displays TMSH the latest version. This is used as the default version.

supported
Displays the current supported TMSH versions on the system.

imported
Displays the imported TMSH versions on the system. An imported TMSH version will be imported from a UCS created from TMSH version which is not supported in the current system - a very rare case. Be aware, for an imported TMSH version, only syntax is supported, if it requires other handling other than syntax change, it will not be supported. So, for an imported TMSH version, it is not fully supported. By default, this entry will not be displayed unless preference is set.

SEE ALSO

cm

cm add-to-trust

NAME
add-to-trust - Add a device to a trust domain.

MODULE
cm

SYNTAX
Run the add-to-trust program within the cm module using the syntax in the following section. The trust-domain name 'Root' is optional beginning version 13.0.0.

MODIFY
run add-to-trust [Root]
options:
[ca-device | non-ca-device]
device [string]
port [port_number]
device-name [string]
password [string]
username [string]

DESCRIPTION
You can use the add-to-trust command to add a device to a trust domain. This is an alternate helper command to the modify trust-domain ca-devices|non-ca-devices add ... command.

EXAMPLES
run add-to-trust ca-device device 10.20.30.40 device-name peer1
username homer password illiad

Adds a device to the list of ca-devices in the trust domain.

OPTIONS

ca-device
Indicates that the added device is a certificate authority device.

device
Indicates the FQDN or the management-ip of the device being added to the trust domain

port Device port number if other than 443 when adding new device. This parameter is optional.

device-name
Used to specify the name of a new device.

md5-fingerprint
SSL certificate md5 fingerprint is deprecated beginning version 13.0.0. Use sha1-fingerprint.

non-ca-device
Indicates that the added device is a subordinate device. The target device cannot be used as a signing authority.

password
Specifies the password for a new device.

serial
SSL certificate serial number is deprecated beginning version 13.0.0. Use sha1-fingerprint.

sha1-fingerprint
Specifies the SSL certificate (DER format) sha1 fingerprint when verifying the identity of a new device. This field is optional.

signature
SSL certificate signature is deprecated beginning version 13.0.0. Use sha1-fingerprint.

username
Specifies the user name required to log on to a device when adding

the device to the trust domain. The user "root" is invalid, and will be disallowed. Any user that has administrator privileges and can use iControl can be used here.

SEE ALSO
run, tmsh

COPYRIGHT

F5 Networks and BIG-IP (c) Copyright 2013-2016. All rights reserved.

BIG-IP 2016-10-04 cm add-to-trust(1)

cm cert

NAME
cert - Manages a CM trust certificate file.

MODULE
cm

SYNTAX
Display the cert component within the cm module using the syntax shown in the following sections.

DISPLAY
list cert
list cert [[[name] | [glob] | [regex]] ...]
show running-config cert
show running-config cert [[[name] | [glob] | [regex]] ...]
options:
all-properties
app-service
certificate-key-size
checksum
create-time
created-by
email
expiration-date
expiration-string
fingerprint
is-bundle
issuer
key-type
last-update-time
mode
non-default-properties
one-line
partition
recursive
revision
serial-number
size
source-path
subject
subject-alternative-name
system-path
updated-by
version

DESCRIPTION
You can use the cert component to display CM trust certificates.

OPTIONS
app-service
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

certificate-key-size
Displays the number of bits in the key associated with this certificate.

checksum
Displays a cryptographic hash or checksum of the file contents for use in verification of file integrity.

create-time
Displays the time at which the trust certificate was created.

created-by
Displays the name of the person, who originally created the trust certificate.

email
Displays the email of the person, who originally created the trust certificate.

expiration-date
Displays the date at which the trust certificate expires. The date is stored as a POSIX time.

expiration-string
Displays a string representation of the trust certificate expiration date.

fingerprint
Specifies the cryptographic fingerprint of the trust certificate.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

is-bundle
Indicates whether the trust certificate file is a bundle (that is, whether it contains more than one certificate).

issuer
Displays the X.509 information for the issuer of the trust certificate. If the trust certificate is a bundle, then this displays the issuer information for the primary (first) trust certificate in the bundle.

key-type
Displays the type of cryptographic key associated with this trust certificate.

last-update-time
Displays the last time the trust certificate was modified.

mode Displays the UNIX(r) file permissions mode for the file associated with this trust certificate as a numerical value.

partition
Displays the partition within which the trust certificate file resides.

recursive
Displays all objects of the specified type and the folder that contains the object.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

revision
Displays the number of the latest revision of the trust certificate. The revision starts with 1 and increments on each update.

serial-number
Displays the serial number of the trust certificate.

size Displays the size (in bytes) of the file associated with the trust certificate.

source-path [URL]
Displays the path to the source of the trust certificate as a URL, for example:

source-path http://cert-server/cert_store/certs/vs_132.key

source-path https://cert-server/cert_store/certs/vs_132.key

source-path
ftp://username:password@server/cert_store/certs/vs_132.key

subject
Displays X.509 information about the subject of the trust certificate. If the certificate is a bundle, then the subject information for the primary (first) trust certificate in the bundle displays.

subject-alternative-name
Displays a standard X.509 extension as shown in RFC 2459.

system-path
Displays the path to the trust certificate.

updated-by
Displays the name of the person, who last updated the trust certificate.

version
Displays the X.509 version of the trust certificate.

cm config-sync

NAME config-sync - Manually synchronizes the configuration between devices.

MODULE cm

SYNTAX Run the config-sync program within the cm module using the syntax in the following section.

MODIFY
run config-sync
options:
from-group
recover-sync
to-group
force-full-load-push

DESCRIPTION
This command starts a configuration synchronization job. One of the from-group, to-group, or recover-sync options must be used to specify the direction of the synchronization.

EXAMPLES
run config-sync from-group my_dg

Updates the configuration on the local device with the configuration from the remote device in the device group /Common/my_dg with the newest configuration. If the local device already has the newest configuration, then the configuration synchronization does nothing.

run config-sync to-group my_dg

Updates the configurations on the remote devices in the device group /Common/my_dg with the configuration on the local device. If the local device does not have the newest configuration, then the configuration synchronization does nothing.

run config-sync recover-sync

Resets the local device configuration and restores the trust domain, device, and device-group information to default settings.

OPTIONS
from-group
Updates the configuration of the local device with the configuration of the remote device in the specified device group that has the newest configuration. If the local device already has the newest configuration, then the configuration synchronization does nothing. This option is mutually exclusive of the to-group and recover-sync options.

recover-sync
WARNING: If you have any local-only configuration, do not use this option.

This option will delete all configuration except for that which is necessary to remain in your device groups. At this point, you can sync from those groups to this device in order to restore your configuration.

Resets the local device configuration and restores the trust domain, device, and device-group information to default settings. After this recovery, you can sync the local device with its peers by running config-sync on a peer device and specifying the device group in which the local device is a member. This option is mutually exclusive of the from-group and to-group options.

to-group
Updates the configurations of the remote devices in the specified device group with the configuration of the local device. If the local device does not have the newest configuration, then the configuration synchronization does nothing. This option is mutually exclusive of the from-group and recover-sync options.

force-full-load-push
This option may only be used if to-group has also been specified. It forces all other devices to pull all synchronizable configuration from this device, even if those devices have the same or newer configuration. It will always send the entire configuration, rather than just the changes, regardless of the device group's full-load-on-sync setting.

You may lose configuration by using this option. This happens if you force a push even when another device in the device group has newer configuration.

SEE ALSO
run, tmsh

BIG-IP 2017-10-09 cm config-sync(1)

cm device-group

NAME

device-group - Configures device groups. The device groups that are created and maintained by the system cannot be modified by the user.

MODULE

cm

SYNTAX

Modify the device-group component within the cm module using the syntax shown in the following sections.

CREATE/MODIFY

```
create device-group [name]
modify device-group [name]
```

options:

```
app-service [[string] | none]
asm-sync [ enabled | disabled ]
auto-sync [ enabled | disabled ]
description [string]
devices [add | delete | modify | replace-all-with] {
    [ device_name ]
}
full-load-on-sync [true | false]
incremental-config-sync-size-max [integer]
network-failover [ enabled | disabled ]
save-on-auto-sync [true | false]
type [ sync-only | sync-failover ]
clear-incremental-config-sync-cache
```

```
edit device-group [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list device-group
list device-group [ [ [name] | [glob] | [regex] ] ... ]
show running-config device-group
show running-config device-group [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
app-service
non-default-properties
partition
recursive
```

```
show device-group
show device-group [name]
```

options:

```
field-fmt
```

DELETE

```
delete device-group [name]
```

Note: The device group must be empty, and you must remove all references to the device group, before you can delete the device group.

DESCRIPTION

You can use the device-group component to manage sets of devices used for configuration synchronization and failover.

EXAMPLES

```
create device-group my_device_group devices add {
/Common/device1
/Common/device2
}
```

Creates a sync-only device group named my_device_group with two devices, device1 and device2.

```
delete device-group my_device_group
```

Deletes the device group named my_device_group.

list device-group my_device_group

Displays properties of the device group named my_device_group.

modify device-group my_device_group clear-incremental-config-sync-cache

Warning: Do not use this option without assistance from the F5 Technical Support team.

Clears the incremental configuration synchronization cache. The next configuration synchronization for my_device_group that pulls configuration from this device will be a full load.

OPTIONS

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

asm-sync

Specifies whether to synchronize ASM configurations of device group members. The default value is disabled. A device can be a member of only one ASM-enabled device group.

auto-sync

Specifies whether the device group automatically synchronizes configuration data to its members. The default value is disabled. Configuration will be saved on remote devices after receiving configuration updates if save-on-auto-sync is enabled.

clear-incremental-config-sync-cache

Warning: Do not use this option without assistance from the F5 Technical Support team.

The incremental configuration synchronization mechanism keeps a cache of transactions in each device group. Specifying this option will remove all transactions from the cache for the given device groups. This will not remove configuration from the device group, but will cause the next load in that group from the current device to be a full load.

description

Specifies a user-defined description of the device group.

devices

Adds, deletes, or replaces a set of devices to a device group by specifying the device name(s). When the local device is removed from a device group then all of the sys folders that are associated with the device group are reset to have no device group and the name of each folder that was updated is logged to /var/log/ltm.

full-load-on-sync

Specifies that the entire configuration for a device group is sent when configuration synchronization is performed. The default value is false.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

incremental-config-sync-size-max

Specifies the maximum size (in KB) to devote to incremental config sync cached transactions. The default is 1024 KB. Valid range is between 128 and 10240."

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

network-failover

When the device group type is failover, specifies whether network failover is used.

partition

Displays the administrative partition within which the device group resides.

recursive

Displays all objects of the specified type and the folder that contains the object.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

save-on-auto-sync

Specifies whether to save the configuration on the remote devices following an automatic configuration synchronization. A device group configured for manual synchronization will always save on the remote devices regardless of this setting.

type Specifies the type of device group. You can use this option only when you create a device group. You cannot modify the type of a device group. The default value is sync-only.

DESCRIPTION

You can use the device component to manage devices.

Warning: To add or remove devices on the BIG-IP system, modify the Root trust domain. For more information, see help trust-domain.

OPTIONS

active-modules

Displays the licensed modules that are currently active on the device.

app-service

Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify the object. Only the Application Service can modify the object.

base-mac

Displays the base MAC address for the device.

build

Displays the software build number.

cert Displays the identity certificate used for device trust.

chassis-id

Displays the chassis identifier.

chassis-type

Displays the chassis type. The possible values are individual and viprion.

comment

Specifies user comments about the device.

configsync-ip

Specifies the IP address used for configuration synchronization. If you specify a self IP address, the self IP address object must be located in the Common folder.

contact

Specifies administrator contact information.

description

Specifies a user-defined description of the device.

edition

Displays the software edition.

failover-state

Displays the device failover state.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ha-capacity

Specifies a number that represents the relative capacity of the device to be active for a number of traffic groups. This value along with the traffic group's ha-load-factor is used by the failover daemon to make traffic groups active amongst the available devices. The value is zero by default which means the device may run any number of traffic groups. The value must be within a valid range: 0 - 100000 inclusive.

hostname

Displays the hostname of the device.

inactive-modules

Displays the licensed modules that are currently inactive on the device.

key Displays the identity key used for device trust.

location

Specifies the physical location of the device.

marketing-name

Displays the marketing name of the device platform.

mgmt-unicast-mode

When a management-ip is added as a failover unicast address; this attribute allows to specify using only an specific family instead of the default both.

mirror-ip

Specifies the IP address used for state mirroring. If you specify a self IP address, the self IP address object must be located in the Common folder.

mirror-secondary-ip

Specifies the secondary IP address used for state mirroring. If you specify a self IP address, the self IP address object must be located in the Common folder.

multicast-interface

Specifies the interface name used for the failover multicast IP address.

multicast-ip

Specifies the multicast IP address used for failover.

multicast-port
Specifies the multicast port used for failover.

optional-modules
Displays the modules that are available for the current platform, but are not currently licensed.

platform-id
Displays the device platform identifier.

product
Displays the software product name.

recursive
Displays all objects of the specified type and the folder that contains the object.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

self-device
Displays true, when the device is the self device.

time-limited-modules
Displays the licensed modules that are time-limited.

time-zone
Displays the time zone configured on the device.

unicast-address
If present, specifies the entire set of unicast addresses used for failover, and replaces all previous unicast addresses. The keyword none may be used to remove all unicast addresses.

Multiple unicast addresses may be specified, each of which has an ip, port, effective-ip, and effective-port.

Each unicast-address when specified has the following parameters:

ip The IP address that the failover daemon will listen on for packets from its peers. This address must be a non-floating self-IP or a management address.

The keyword management-ip may be used to specify that the current addresses of the device management interface are used. The mgmt-unicast-mode will narrow down the selection based on the address family.

port The IP port that the failover daemon uses to accept packets from its peers. If not specified, 1026 will be used.

effective-ip
The IP address that peers can use to reach this unicast address IP. This option is only needed if a address-translating firewall exists between the peer BIG-IPs. If not present, the effective-ip is the same as the ip.

effective-port
The port that peers can use to reach this unicast address. This option is only needed if a port-translating firewall exists between the peer BIG-IPs. If not present, the effective-port is the same as the port.

version
Displays the software version number.

cm failover-status

NAME
failover-status - Display the failover status of the local device.

MODULE
cm

SYNTAX
Display failover-status component within the cm module using the syntax in the following section.

DISPLAY
show failover-status
options:
field-fmt

DESCRIPTION
You can use the failover-status component to display the failover status of the local device.

For information about the options that you can use with the command show, see help show.

EXAMPLE
show failover-status
Displays the failover status of the local device.

SEE ALSO
show, tmsh

COPYRIGHT

BIG-IP 2012-03-19 cm failover-status(1)

cm key

NAME
key - Manages a CM trust certificate private key file.

MODULE
cm

SYNTAX
Display or delete a key component within the cm module using the syntax shown in the following sections.

DISPLAY
list key
list key [[[name] | [glob] | [regex]] ...]
show running-config key
show running-config key [[[name] | [glob] | [regex]] ...]
options:
all-properties
app-service
checksum
create-time
created-by
key-size
key-type
last-update-time
mode
non-default-properties
one-line
partition
recursive
revision
security-type
size
source-path
system-path
updated-by

DISPLAY
delete key [name]

=head1 **DESCRIPTION**

You can use the following options with the key component.

OPTIONS
app-service
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

checksum
Displays a cryptographic hash or checksum of the key for use in

verification of key integrity.

create-time
Displays the time at which the key was created.

created-by
Displays the user who originally created the key.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

key-size
Displays the size of the cryptographic key, in bits.

key-type
Displays the cryptographic algorithm that this key is compatible with. A key can be one of two types:

rsa-private
The key is an RSA private key.

dsa-private
The key is a DSA based private key.

last-update-time
Displays the time at which the key was last modified.

mode Displays the UNIX file permissions mode for the file associated with this key. The mode is expressed in numerical form.

name Specifies the name of the key you want to delete.

partition
Displays the partition within which the key resides.

recursive
Displays all objects of the specified type and the folder that contains the object.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

revision
Displays the latest revision of the key. The revision starts with 1 increments on each update.

security-type
Displays the type of security used to handle or store the key. There are four mutually exclusive options:

normal
Indicate the key resides in a standard form on the file-system. This is the default security type.

fips Indicates that the key is protected by a FIPS device on the system, and is only applicable to devices with FIPS support.

password
Indicates that the key is protected by a passphrase and stored in encrypted form.

nethsm
Indicates that the key is protected by a FIPS device outside the system.

size Displays the size (in bytes) of the file associated with this file object.

source-path [URL]
Displays the path to the source of the key. This option takes a URL, for example:

source-path http://cert-server/cert_store/certs/vs_132.key

source-path https://cert-server/cert_store/certs/vs_132.key

source-path ftp://user_name:user_password@user_server/cert_store/certs/vs_132.key

system-path
Displays the location where the key is stored on the system.

updated-by
Displays the name of the user who last updated the key.

cm remove-from-trust

NAME
remove-from-trust - Remove a device from a trust domain.

MODULE
cm

SYNTAX
Run the remove-from-trust program within the cm module using the syntax in the following section. The trust-domain name 'Root' is optional beginning version 13.0.0.

MODIFY
run remove-from-trust [Root]
options:
[ca-device | non-ca-device]
device-name [string]

DESCRIPTION
You can use the remove-from-trust command to remove a device from a trust domain. This is an alternate helper command to the modify trust-domain ca-devices|non-ca-devices delete ... command.

EXAMPLES
run remove-from-trust ca-device device-name peer1

Removes a device from the list of ca-devices in the trust domain Root.

OPTIONS
ca-device
Indicates that the added device is a certificate authority device.

device-name
Used to specify the name of a new device.

non-ca-device
Indicates that the added device is a subordinate device.

SEE ALSO
run, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-02-17 cm remove-from-trust(1)

cm sha1-fingerprint

NAME
sha1-fingerprint - Display SHA1 fingerprint of the local device SSL certificate in DER format.

MODULE
cm

SYNTAX
Run the sha1-fingerprint command sequence within the cm module using the syntax in the following section.

DISPLAY
show sha1-fingerprint
options:
field-fmt

DESCRIPTION
You can use the sha1-fingerprint component to display the local box SSL SHA1 checksum and provide this value to a remote authority device that is trying to add the local device to a trust domain. This allows the remote device to verify the identity of the local device when establishing the SSL connection.

For information about the options that you can use with the command show, run the command sequence help show.

EXAMPLE
show shal-fingerprint

Display SHA1 fingerprint of the local device SSL certificate in DER format.

OPTIONS
field-fmt

Formats the shal fingerprint output in command syntax.

SEE ALSO
show, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2017-01-20 cm shal-fingerprint(1)

cm sniff-updates

NAME
sniff-updates - Displays the commit ID updates that occur over the CMI communications channel

MODULE
cm

SYNTAX
run cm sniff-updates
options:
[-v]

DESCRIPTION
You can use the sniff-updates program to monitor the internal CMI communications channel for commit ID updates. The system displays each update as it arrives, one per line.

(1) (2) (3) (4) (5) (6) (7) (8) (9) (10)
[15:35:57] bigip1 (v0.0.0) -> device_trust_group: CID 105.105 (bigip2) at 15:34:39 FORCE_SYNC

Output fields:
1) Time that update arrived from network
2) Source device
3) Version of source device
4) Destination devicegroup
5) CommitId ID
6) DeviceData CommitId ID
7) CommitId originator
8) CommitId timestamp
9) FORCE_SYNC if set (nothing if not)
10) Last sync error message (nothing if last sync was successful)

OPTIONS
You can use the following option when you run the sniff-updates program:

-v Formats the update output using fully-qualified device and device group names and exact time64_t timestamps.

SEE ALSO
run, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03-14 cm sniff-updates(1)

cm sync-status

NAME
sync-status - Displays the configuration synchronization status of the local device.

MODULE
cm

SYNTAX
Run the sync-status command sequence within the cm module using the syntax in the following section.

DISPLAY
show sync-status
options:
field-fmt

DESCRIPTION
You can use the sync-status component to display the configuration synchronization status of the local device.

For information about the options that you can use with the command show, run the command sequence help show.

EXAMPLE
show sync-status

Displays the configuration synchronization status of the local device:

OPTIONS
field-fmt

Formats the status output in command syntax.

SEE ALSO
show, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2012-03-19 cm sync-status(1)

cm traffic-group

NAME
traffic-group - Manages a CM traffic group.

MODULE
cm

SYNTAX
Manage the traffic-group component within the cm module using the syntax shown in the following sections.

CREATE/MODIFY
create traffic-group [name]
modify traffic-group [name]
options:
app-service [[string] | none]
auto-failback-enabled [enabled | disabled]
auto-failback-time [integer]
description [string]
failover-method [ha-score | ha-order]
ha-group [string]
ha-load-factor [integer]
ha-order [string ...]
mac [mac address
monitor { ha-group [string] }

edit traffic-group [[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list traffic-group
list traffic-group [[name] | [glob] | [regex]] ...]

```
show running-config traffic-group
show running-config traffic-group [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  is-floating
  non-default-properties
  one-line
  partition
recursive
unit-id [integer]
```

```
show traffic-group
show traffic-group [name]
options:
  all-properties
  details
  failover-objects
  field-fmt
```

```
DELETE
delete traffic-group [name]
```

DESCRIPTION

You can use the traffic-group component to specify the failover behavior for devices in a failover device group.

EXAMPLES

```
create traffic-group my_traffic_group
```

Creates a traffic group named my_traffic_group.

```
create traffic-group my_traffic_group ha-order { my_device }
```

Creates a traffic group named my_traffic_group with a preferred device named my_device.

OPTIONS

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

auto-failback-enabled

Specifies whether the traffic group fails back to the default device.

auto-failback-time

Specifies the time required to fail back. The value must be within a valid range: 0 - 300 inclusive.

details

Only usable with the show command. Displays the active or next-active devices for this traffic group.

failover-method

Specifies the method used to decide if the current device needs to failover the traffic-group to another device. If the failover-method is set to ha-score, a score is calculated for each device in the monitoring HA group; and the highest score is the current active device while the next highest score will be the device that takes over if the current one fails. If the failover-method is set to ha-order, a list of devices and their respective HA load is used to decide the next one to take over if the current devices fails.

failover-objects

Only usable with the show command. Tells it to display all of the objects associated with that traffic group.

ha-group

Deprecated since v13.0.0. Use monitor and failover-method instead. This specifies a ha-group for the traffic group to decide the active device within the traffic group. The HA group must exist first. Note: This attribute is only specific to the local device i.e. not sync'ed to its peers in the traffic group. If you use this deprecated command attribute, it will also set the failover-method to ha-score.

ha-order

This list of devices specifies the order in which the devices will become active for the traffic group when a failure occurs. This list may contain zero, one or more entries up to the number of devices in the failover device group. If auto-failback enabled is set to true, this list must contain at least one entry for the auto-failback device.

ha-load-factor

Specifies a number for this traffic group that represents the load this traffic group presents to the system relative to other traffic groups. This allows the failover daemon to load balance the active traffic groups amongst the devices. The value is one by default. The value must be within a valid range: 1 - 1000 inclusive.

monitor { ha-group [string] }

This specifies a ha-group monitor for the traffic group to decide the active device within the traffic group. The HA group must exist first. Note: This attribute is only specific to the local device i.e. not sync'ed to its peers in the traffic group.

description

Specifies a user-defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

is-floating

Indicates whether the traffic group can fail over to other devices in the device group.

mac Specifies a MAC address for the traffic group.

partition

Displays the administrative partition within which the device group resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

recursive

Displays all objects of the specified type and the folder that contains the object.

unit_id

Displays the unit ID for the traffic group. The unit ID is set automatically when you create a traffic group. The value is between 1 and 15.

SEE ALSO

create, delete, edit, glob, list, modify, regex, tmsh

COPYRIGHT

BIG-IP 2016-10-04 cm traffic-group(1)

cm trust-domain

NAME

trust-domain - Manages a CM trust domain by providing control of object failover.

MODULE

cm

SYNTAX

Manage the trust-domain component within the cm module using the syntax shown in the following sections. The trust-domain name 'Root' is optional beginning with version 13.0.0. The 'create cm trust-domain' command is not allowed beginning version 13.0.0.

MODIFY

modify trust-domain [Root]

options:

```
add-device {
  [ ca-device [true | false] | non-ca-device [true | false] ]
  device-ip [string]
  device-port [port_number]
  device-name [string]
  username [string]
  password [string]
  sha1-fingerprint [string]
}
devices delete {
  [ device names ]
}
remove-device [string]
```

deprecated since v13.0.0:

```
ca-devices [add | delete | modify | replace-all-with] {
  [ device_name | ip address ]
}
md5-fingerprint [string]
name [string]
non-ca-devices [add | delete | modify | replace-all-with] {
  [ device_name | ip address ]
}
password [string]
serial [string]
sha1-fingerprint [string]
username [string]
```

```

DISPLAY
list trust-domain
list trust-domain [ [name] | [glob] | [regex] ] ... ]
show running-config trust-domain
show running-config trust-domain [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  ca-cert
  ca-cert-bundle
  ca-key
  ca-devices
  non-ca-devices
  non-default-properties
  one-line
  partition
  recursive
status
  trust-group

DELETE/RESTART
restart trust-domain
delete trust-domain
options:
  keep-current-certificate-authority
  import-user-defined-cert [string]
  import-user-defined-key [string]

```

DESCRIPTION
 You can use the trust-domain component to manage the behavior of objects during fail over.

DELETE/RESTART operations
 When applied to a trust-domain these operations reset the trust and make this device standalone.

EXAMPLES
 Adds a certificate authority:

```

modify trust-domain add-device { ca-device true device-ip 192.168.1.245
device-name myDevice1 device-port 1234 username admin password admin }

```

Adds a non-authoritative certificate:

```

modify trust-domain add-device { ca-device false ip 192.168.1.248
device-name myDevice2 username admin password admin sha1-fingerprint
ab7012e8d834e639f497b2b1c9f1e855a4dbe232}

```

Removes a device from the trust domain:

```

modify trust-domain devices delete { myDevice1 myDevice2}

```

Resets the trust and makes this device standalone:

```

restart cm trust-domain

```

or

```

delete cm trust-domain

```

EXAMPLES (deprecated since V13.0.0)
 Adds a certificate authority:

```

modify trust-domain Root ca-devices add { 192.168.1.245 } name
myDevice1 username admin password admin

```

Adds a non-authoritative certificate:

```

modify trust-domain Root non-ca-devices add { 192.168.1.245 } name
myDevice1 username admin password admin

```

Removes a device from the trust domain:

```

modify trust-domain Root ca-devices delete { myDevice1 }

```

OPTIONS

- add-device
Adds a device to the trust domain.
- device-ip
Device IP address when adding new device.
- device-port
Device port number if other than 443 when adding new device. This parameter is optional.
- device-name
Device name when adding new device.
- username
Specifies the user name required to log on to a device when adding the device to the trust domain.
- password
Specifies the password corresponding to the username required to log on to a device when adding the device to the trust domain.
- sha1-fingerprint
Specifies the SSL certificate (DER format) sha1 fingerprint when verifying the identity of a new device. This field is optional.
- app-service

Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

ca-cert

Displays the certificate authority device trust certificate.

ca-cert-bundle

Displays the bundled certificate authority device trust certificates used to authenticate incoming connections.

ca-devices

Create and modify operations are deprecated since v13.0.0. List operation is still supported. Set of certificate authority devices in the trust domain.

ca-key

Displays the certificate authority device trust key. This key only displays for certificate authorities.

devices

Removes one or more devices from the trust domain. It takes the name of the device as the identifier.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

import-user-defined-cert

Specifies the certificate to import and use as the trust domain's new certificate authority. You must also use the import-user-defined-key option to specify the corresponding key. This option cannot be specified alongside keep-current-certificate-authority.

import-user-defined-key

Specifies the key to import and use as the trust domain's new certificate authority key. You must also use the import-user-defined-cert option to specify the corresponding certificate. This option cannot be specified alongside keep-current-certificate-authority.

keep-current-certificate-authority

By default, resetting trust will generate a new certificate authority. Adding this option to the delete command will instead keep the current certificate authority. This option cannot be specified alongside import-user-defined-cert or import-user-defined-key.

md5-fingerprint

Deprecated since v13.0.0. Specifies the SSL certificate fingerprint when verifying the identity of a new device.

name Deprecated since v13.0.0. Option used to specify the name of a new device.

non-ca-devices

Create and modify operations are deprecated since v13.0.0. List operation is still supported. Set of subordinate devices in the trust domain.

password

Deprecated since v13.0.0. Specifies the password for a new device.

recursive

Displays all objects of the specified type and the folder that contains the object.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

remove-device

Removes a single device from the trust domain. It takes the name of the device as the identifier.

serial

Deprecated since v13.0.0. Specifies the SSL certificate serial number when verifying the identity of a new device.

shal-fingerprint

Deprecated since v13.0.0. Specifies the SSL certificate fingerprint when verifying the identity of a new device.

signature

Deprecated since v13.0.0. Specifies the SSL certificate signature, when verifying the identity of a new device.

status

Displays the status of the trust domain.

trust-group

Displays the device group associated with the trust domain.

username

Deprecated since v13.0.0. Specifies the user name required to log on to a device when adding the device to the trust domain.

SEE ALSO

BIG-IP 2016-10-11 cm trust-domain(1)

cm watch-devicegroup-device

NAME

watch-devicegroup-device - Displays information about the devices in the device group to which the local device belongs.

MODULE

cm

SYNTAX

Run the watch-devicegroup-device program within the cm module using the syntax shown in the following sections.

RUN

```
run watch-devicegroup-device
```

DESCRIPTION

You can use the watch-devicegroup-device program to view dynamic information about the synchronization of the devices in the device group to which the local device belongs. You can use this information to monitor or troubleshoot the devices.

By default, multiple devices with identical information are collapsed into a single row that displays in green. The devices column identifies the devices by the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16. Use the c (collapse) command to deactivate/activate this behavior.

For example, when you make a change to a device, the change is identified by a commit ID (cid.id) that displays when you run the watch-devicegroup-device program.

Within the program, you can use the following keys:

Press h to see a list of available commands.
Press the back tick key (`) to exit the help page.
Press c to toggle the view from a collapsed view to a full view. The command gathers information from every device in the trust group. When all devices in the trust group report the same information the view is collapsed and one line, highlighted in green, displays the information. The devices included in the line are shown in the devices column. You can press c to see the full view, which displays each device on a separate line.
Press Ctrl-C to exit the program.
Press the arrow keys to navigate across the columns or down the rows.

The content in the columns includes:

devices

Displays the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the config-sync IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16.

devgroup

Displays the name of the device group to which the device belongs.
Note: This can be a sync-only, failover, or trust device group.

device

Displays the device object name.

cid.id

Displays the commit ID, which is a configuration change identifier.

cid-orig

Displays the name of the device on which the configuration change was made.

cid.time

Displays the time the configuration change was made.

last_sync

Displays the time the device configuration was last synchronized with the device group.

The devices in the to-group of a configuration synchronization display the same time in this column. The local device that pushes the configuration to the other devices in the device group (to-

group) has a different value in this column.

The devices in the from-group of a configuration synchronization display the same time in this column. The local device that receives the configuration from the other devices has a different value in this column. You can use this information to determine a rollback strategy.

BIG-IP 2017-06-30 cm watch-devicegroup-device(1)

cm watch-sys-device

NAME

watch-sys-device - Displays information about the local device.

MODULE

cm

SYNTAX

Run the watch-sys-device program within the cm module using the syntax shown in the following sections.

RUN

run watch-sys-device

DESCRIPTION

You can use the watch-sys-device program to view dynamic information about the local device.

By default, multiple devices with identical information are collapsed into a single row that displays in green. The devices column identifies the devices by the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16. Use the c (collapse) command to deactivate/activate this behavior.

Within the program, you can use the following keys:

Press h to see a list of available commands.

Press the back tick key (`) to exit the help page.

Press c to toggle the view from a collapsed view to a full view. The command gathers information from every device in the trust group. When all devices in the trust group report the same information the view is collapsed and one line, highlighted in green, displays the information. The devices included in the line are shown in the devices column. You can press c to see the full view, which displays each device on a separate line.

Press Ctrl-C to exit the program.

Press the arrow keys to navigate across the columns or down the rows.

The content in the columns includes:

devices

Displays the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16.

name Displays the device object name.

platform

Displays the device platform.

build

Displays the software build installed on the device.

failover_state

Displays the high availability state (active or standby) of the device.

mgmt_ip

Displays the IP address of the management port on the device.

configsync_ip

Displays the IP address on the device that is used for configuration synchronization.

`unicast_ip`
Displays the unicast IP address of the device.

`multicast_ip`
Displays the multicast IP address of the device.

`mirror_ip`
Displays the IP address used for configuration mirroring for the device.

`mirror_secondary_ip`
Displays the secondary IP address used for configuration mirroring for the device.

`desc` Displays a description of the device.

SEE ALSO

BIG-IP 2017-06-30 `cm watch-sys-device(1)`

cm watch-trafficgroup-device

NAME

`watch-trafficgroup-device` - Displays information about the traffic groups associated with devices in a device group.

MODULE

`cm`

SYNTAX

Run the `watch-trafficgroup-device` program within the `cm` module using the syntax shown in the following sections.

RUN

`run watch-trafficgroup-device`

DESCRIPTION

You can use the `watch-trafficgroup-device` program to view dynamic information about the failover status of the devices in a device group to which the local device belongs. You can use this information to monitor or troubleshoot the devices in the device group.

By default, multiple devices with identical information are collapsed into a single row that displays in green. The devices column identifies the devices by the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16. Use the `c` (collapse) command to deactivate/activate this behavior.

Within the program, you can use the following keys:

Press `h` to see a list of available commands.

Press the back tick key (```) to exit the help page.

Press `c` to toggle the view from a collapsed view to a full view. The command gathers information from every device in the device group. When all devices in the device group report the same information the view is collapsed and one line, highlighted in green, displays the information. The devices included in the line are shown in the devices column. You can press `c` to see the full view, which displays each device on a separate line.

Press `Ctrl-C` to exit the program.

Press the arrow keys to navigate across the columns or down the rows.

The content in the columns includes:

`devices`

Displays the suffix of the configuration synchronization IP address configured on the device. For example, if the devices in a device group have the IP addresses 10.0.0.15 and 10.0.0.16, the IDs in this column will be 15 and 16.

`traffic_group`

Displays the name of the traffic group associated with the device.

`device_name`

Displays the device object name.

`failover_state`

Displays the high availability state (active or standby) of the

device.

next_active
Displays True for the device that becomes active if the active traffic group fails over.

score
Displays a system-generated high availability score used to select the next active device.

gtm

gtm datacenter

NAME

datacenter - Configures a Global Traffic Manager(tm) data center.

MODULE

gtm

SYNTAX

Configure the datacenter component within the gtm module using the syntax in the following sections.

CREATE/MODIFY

```
create datacenter [name]
modify datacenter [name]
options:
  app-service [[string] | none]
  contact [ [name] | none]
  description [string]
  [disabled | enabled]
  location [none | [physical location] ]
  prober-fallback [ any-available | inside-datacenter | outside-datacenter | pool | none ]
  prober-pool [none | name]
  prober-preference [ inside-datacenter | outside-datacenter | pool ]
  metadata
    [add | delete | modify] {
[metadata name ... ] {
  value [ "value content" ]
  persist [ true | false ]
}
}
```

```
edit datacenter [ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
  one-line
```

```
reset-stats datacenter
```

```
reset-stats datacenter [ [ [name] | [glob] | [regex] ] ... ]
```

DISPLAY

```
list datacenter
list datacenter [ [ [name] | [glob] | [regex] ] ... ]
show running-config datacenter
show running-config datacenter [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
show datacenter
```

```
show datacenter [name]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt
```

DELETE

```
delete datacenter [name]
```

DESCRIPTION

You can use the datacenter component to create, modify, display, or delete a data center.

EXAMPLES

```
create datacenter DC1
```

Creates a data center named DC1 with options set to the default values.

```
list datacenter DC1 all-properties
```

Displays all properties of the data center named DC1.

OPTIONS

app-service

Specifies the name of the application service to which the data center belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the data center. Only the application service can modify or delete the data center.

contact

Specifies the name of the administrator or the name of the department that manages the data center. The default value is none.

description

User defined description.

[disabled | enabled]

Specifies whether the data center and its resources are available for load balancing. The default value is enabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

location

Specifies the physical location of the data center. The default value is none.

metadata

Specifies user-defined data to associate with a server. By default the persist attribute is set to true. This means the data is saved into the configuration file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

prober-fallback

Specifies the type of prober to use to monitor servers defined in this data center when the preferred type is not available. The default value is any-available.

prober-pool

Specifies a prober pool to use to monitor servers defined in this data center when either the prober-preference or prober-fallback value is pool. If neither the prober-preference or prober-fallback value is pool, the prober-preference and prober-fallback values are set to pool and any-available.

prober-preference

Specifies the type of prober to use to monitor servers defined in this data center. The default value is inside-datacenter.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

create, delete, glob, gtm link, gtm prober-pool, gtm server, list, modify, regex, reset-stats, show, tmsh

gtm distributed-app

NAME

distributed-app - Configures a Global Traffic Manager(tm) distributed application.

MODULE

gtm

SYNTAX

Configure the distributed-app component within the gtm module using the syntax in the following sections.

```
CREATE/MODIFY
create distributed-app [name]
modify distributed-app [name]
options:
  app-service [[string] | none]
  dependency-level [datacenter | link | none | server | wideip]
  description [string]
  disabled-contexts
    [add | delete | modify | replace-all-with] {
      [datacenter | link | server] [name] ...
    }
  disabled-contexts none
  persistence [enabled | disabled]
  persist-cidr-ipv4 [integer]
  persist-cidr-ipv6 [integer]
  ttl-persistence [integer]
  wideips
    [add | delete | replace-all-with] {
      [name] ...
    }
  wideips [default | none]

edit distributed-app
[ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

reset-stats distributed-app
reset-stats distributed-app
[ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list distributed-app
list distributed-app [ [ [name] | [glob] | [regex] ] ... ]
show running-config distributed-app
show running-config distributed-app
[ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

show distributed-app
show distributed-app [name]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt

DELETE
delete distributed-app [name]
```

DESCRIPTION
You can use the distributed-app component to create, modify, display, or delete a distributed application.

EXAMPLES
create distributed-app DA1

Creates a distributed application named DA1 with options set to the default values.

list distributed-app DA1 all-properties

Displays all properties of the distributed application named DA1.

OPTIONS

app-service
Specifies the name of the application service to which the distributed application belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the distributed application. Only the application service can modify or delete the distributed application.

dependency-level
Specifies the resources that must be in the available state before this distributed application is considered available. The options are:

datacenter
All of the data centers on the member list of this distributed application must be in an available state before the system considers the distributed application available.

link All of the links on the member list of this distributed application must be in an available state before the system considers the distributed application available.

none The distributed application has no dependencies. This value effectively disables this option. This is the default value.

server
All of the servers on the member list of this distributed application must be in an available state before the system considers the distributed application available.

wideip
All of the Wide IPs on the member list of this distributed

application must be in an available state before the system considers the distributed application available.

description
User defined description.

disabled-contexts
Specifies the components that you want to add to or delete from this distributed application as disabled-contexts. You can also replace all of the components that are currently listed as disabled-contexts for this distributed application with other components. The default value is none.

The possible values are:

datacenter
Specifies the datacenters, by name, to which the system does not send traffic from this distributed application.

link Specifies the links, by name, to which the system does not send traffic from this distributed application.

none There are no components to which the system does not send traffic from this distributed application. This value effectively disables this option.

server
Specifies the servers, by name, to which the system does not send traffic from this distributed application.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition
Displays the administrative partition within which this object resides.

persistence
When enabled, if a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4
Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6
Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

ttl-persistence
Specifies, in seconds, the length of time for which the persistence entry is valid. The default value is 3600.

wideips
Specifies the Wide IPs, by name, that you want to add to or delete from this distributed application. You can also replace all of the Wide IPs that are currently associated with this distributed application with other Wide IPs. The default value is none.

A Wide IP is a collection of one or more domain names that maps to one or more groups of virtual servers managed either by BIG-IP(r) systems, or by host servers. The Global Traffic Manager load balances name resolution requests across the virtual servers that are defined in the Wide IP that is associated with the requested domain name.

gtm global-settings general

NAME
general - Configures the general settings for the Global Traffic Manager.

MODULE
gtm global-settings

SYNTAX
Modify or display the general component within the gtm global-settings module using the syntax in the following sections.

MODIFY
modify general
options:
automatic-configuration-save-timeout [integer]
auto-discovery [no | yes]
auto-discovery-interval [integer]
cache-ldns-servers [no | yes]
domain-name-check [allow-underscore | none]
drain-persistent-requests [no | yes]
forward-status [enable | disable]
gtm-sets-recursion [no | yes]
heartbeat-interval [integer]
monitor-disabled-objects [no | yes]
nethsm-timeout [integer]
peer-leader [name]
send-wildcard-rrs [enable | disable]
static-persist-cidr-ipv4 [integer]
static-persist-cidr-ipv6 [integer]
synchronization [no | yes]
synchronization-group-name [name]
synchronization-time-tolerance [integer]
synchronization-timeout [integer]
synchronize-zone-files [no | yes]
synchronize-zone-files-timeout [integer]
topology-allow-zero-scores [no | yes]
virtuals-depend-on-server-state [no | yes]

edit general
options:
all-properties
non-default-properties
one-line

DISPLAY
list
list general
show running-config general
show running-config general [option name]
options:
all-properties
non-default-properties

DESCRIPTION
You can use the general component to modify or display the General Traffic Manager settings.

EXAMPLES
modify general auto-discovery no

Turns off auto-discovery for the Global Traffic Manager.

list general all-properties

Displays all properties of the general settings for the Global Traffic Manager.

OPTIONS
automatic-configuration-save-timeout
Sets the timeout, in seconds, indicating how long to wait after a GTM configuration change before automatically saving the GTM configuration to the bigip gtm.conf. A timeout of -1 will cause the GTM configuration to NEVER be saved. A value of 0 will cause the GTM configuration to be saved immediately. The default value is 15 seconds.

auto-discovery
Specifies whether the auto-discovery process is activated for this system. The default value is no.

auto-discovery-interval
Specifies the frequency, in seconds, between system attempts to discover network components. The default value is 30.

cache-ldns-servers
Specifies whether the system retains, in cache, all local DNS servers that make requests. The default value is yes.

You must enable this option if you want the system to store and use the LDNS path information.

domain-name-check
Specifies the parameters for the Global Traffic Manager to use when performing domain name checking. The default value is allow-underscore.

The possible values are:
allow-underscore

The Global Traffic Manager checks domain names according to the specifications in RFC 1123 Requirements for Internet Hosts - Application and Support, except that underscores are allowed.

none

No validation is performed. Anything is allowed.

idn-compatible

Deprecated since v12.1.0. Equivalent to allow-underscore. Value of idn-compatible will be saved as allow-underscore.

strict

Deprecated since v12.1.0. Equivalent to allow-underscore. Value of strict will be saved as allow-underscore.

drain-persistent-requests

Specifies, when set to yes, that when you disable a pool, load-balanced, persistent connections remain connected until the TTL expires. The default value is yes. If you set this option to no, any persistent connections terminate immediately when a pool is disabled.

forward-status

Specifies, when set to enabled, that the availability status change for GTM objects will be shared with subscribers. This option will enable iControl clients to receive event notifications when a change occurs.

gtm-sets-recursion

Specifies, when set to yes, that the system enables recursive DNS queries, regardless of whether the requesting local DNS enabled recursive queries. The default value is no.

heartbeat-interval

Specifies the frequency at which the Global Traffic Manager queries other BIG-IP(r) systems for updated data. When configuring monitors for BIG-IP systems, F5 Networks recommends that the probe-interval option for the monitor be equal to or greater than the this option. The default value is 10.

monitor-disabled-objects

Specifies, when set to yes, that the system will continue to monitor objects even if the objects are disabled. The default value is no.

nethsm-timeout

Time to wait on a NetHSM key creation operation for DNSSEC before retry. Default is 20 seconds.

peer-leader

Specifies the name of a GTM server to be used for executing certain features, such as creating DNSSEC keys.

send-wildcard-rrs

Specifies, when set to enable, that WideIPs or WideIP aliases that contain wildcards will autogenerate Resource Records in the BIND database. The default value is disable.

static-persist-cidr-ipv4

Specifies the number of bits of the IPv4 address that the system considers when using the Static Persist load balancing mode. The default value is 32.

static-persist-cidr-ipv6

Specifies the number of bits of the IPv6 address that the system considers when using the Static Persist load balancing mode. The default value is 128.

synchronization

Specifies whether this system is a member of a synchronization group. The default value is no.

Members of the synchronization group continuously share configuration and metrics collection information. The synchronization group can contain Global Traffic Managers and Link Controllers.

synchronization-group-name

Specifies the name of the synchronization group to which the system belongs. The default name is default.

synchronization-time-tolerance

Specifies the number of seconds that one system clock can be out of sync with another system clock, in the synchronization group. If the variance between the clock times is higher than the time tolerance setting, the system logs the time difference once per hour.

Possible values are 0 (zero), and 5 - 600. (Values 1 through 4 are automatically set to 5, and 0 (zero) turns time synchronization off.) The default value is 10 seconds.

Note: If you are using NTP to synchronize the clock with a time server, select a time tolerance other than 0 (zero). When you do this, the system uses the synchronization-time-tolerance option as a fail-over mechanism if NTP is disabled for any reason.

synchronization-timeout

Specifies the number of seconds that the system attempts to synchronize the Global Traffic Manager configuration with a synchronization group member. If the synchronization times out, the system tries again. The default value is 180.

synchronize-zone-files
Specifies whether the system synchronizes zone files among the synchronization group members. The default value is no.

synchronize-zone-files-timeout
Specifies the number of seconds that a synchronization group member attempts to synchronize its zone files with a synchronization group member. If the synchronization times out, the system tries again. The default value is 300.

topology-allow-zero-scores
Specifies if topology load-balancing or QoS load-balancing with topology enabled will return pool members with zero topology scores. The default value is yes.

virtualls-depend-on-server-state
Specifies whether the system marks a virtual server down when the server on which the virtual server is configured can no longer be reached via iQuery. The default value is yes.

gtm global-settings load-balancing

NAME

load-balancing - Configures the load balancing settings for the Global Traffic Manager(tm).

MODULE

gtm global-settings

SYNTAX

Modify or display the load-balancing component within the gtm global-settings module using the syntax in the following sections.

MODIFY

modify load-balancing

options:

failure-rcode [noerror | formerr | servfail | nxdomain | notimpl | refused]
failure-rcode-ttl [integer]
failure-rcode-response [disabled | enabled]
ignore-path-ttl [no | yes]
respect-fallback-dependency [no | yes]
topology-longest-match [no | yes]
topology-prefer-edns0-client-subnet [disabled | enabled]
verify-vs-availability [no | yes]

edit load-balancing

options:

all-properties
non-default-properties

DISPLAY

list
list load-balancing
show running-config load-balancing
show running-config load-balancing [option]
options:
all-properties
non-default-properties
one-line

DESCRIPTION

You can use the load-balancing component to modify or display the load balancing settings for the Global Traffic Manager.

EXAMPLES

modify load-balancing ignore-path-ttl yes

Specifies that dynamic load balancing methods can use path data, even after the time-to-live (TTL) for the path data expires.

list load-balancing all-properties

Displays all properties of the load balancing settings for the Global Traffic Manager.

OPTIONS

failure-rcode

Specifies the DNS RCODE used when failure-rcode-response is enabled. Default is noerror. Options include noerror (no type exists at this name), formerr (format error in query), servfail (unable to process query), nxdomain (name does not exist), notimpl (no support for this kind of query), and refused (refuse to process based on policy). If failure-rcode-ttl is non-zero, only the Authority section of the noerror or nxdomain response will include a SOA record.

failure-rcode-response

When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This affects all Wide IPs and may only be overridden by a more specific enabled configuration of a Wide IP. This response is an authoritative empty answer from the system for record requests. With this option enabled, the system responds faster to requests for which it does not have viable answers configured. The default value is disabled.

failure-rcode-ttl

Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

ignore-path-ttl

Specifies, when set to yes, that dynamic load balancing methods can use path data, even after the time-to-live (TTL) for the path data expires. The default value is no.

respect-fallback-dependency

Specifies, when set to yes, that the system accepts virtual server status when the load balancing mode changes to the mode specified by the fallback-mode option of the pool. The default value is no.

topology-longest-match

Specifies, when set to yes, that the system evaluates all topology records in the topology statement, and then selects the topology record that most specifically matches the IP address in an LDNS request (in other words, has the longest match). When this option is set to no, the system selects the first record in the topology statement that matches the request.

topology-prefer-edns0-client-subnet

Specifies, when set to enabled, that the system should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

When disabled this option can be overridden by a per wide IP setting, gtm wideip [wideip type] [wideip name] topology-prefer-edns0-client-subnet [disabled | enabled].

verify-vs-availability

Specifies, when set to yes, that the system checks the availability of virtual servers before sending a connection to those virtual servers. The default value is no.

list metrics-exclusions
show running-config metrics-exclusions
  addresses
options:
  all-properties
  one-line

DESCRIPTION
  You can use the metrics-exclusions component to exclude IP addresses
  from the Global Traffic Manager metrics.

EXAMPLES
  modify metrics-exclusions addresses add {10.10.10.1}

  Excludes the IP address 10.10.10.1 from inclusion in the Global Traffic
  Manager metrics.

  list metrics-exclusions

  Displays the IP addresses that are excluded from the Global Traffic
  Manager metrics.

OPTIONS
  ip address
  Specifies the IP addresses that you want to add to or delete from
  the exclusion list, or with which you want to replace all existing
  IP addresses that are currently on the exclusion list.

```

non-default-properties
one-line

DISPLAY
list
list metrics
show running-config metrics
show running-config metrics [option]
options:
all-properties
non-default-properties

DESCRIPTION
You can use the metrics component to modify or display the Global Traffic Manager metrics settings.

EXAMPLES
modify metrics default-probe-limit 10

Sets the default probe limit for the Global Traffic Manager to 10.

list metrics all-properties

Displays all properties of the metrics settings for the Global Traffic Manager.

OPTIONS
default-probe-limit
Specifies the number of probe attempts that the system performs before removing the path from the metrics. The default value is 12.

hops-ttl
Specifies the number of seconds that the system considers traceroute utility data to be valid for name resolution and load balancing. The default value is 604800. Note that this option must be greater than the hops-timeout option.

hops-packet-length
Specifies the length of packets, in bytes, that the system sends to a local DNS server to determine the path information between the two systems. Valid values are 64 - 500. The default value is 64.

hops-sample-count
Specifies the number of packets that the system sends to a local DNS server to determine the path information between those two systems. Valid values are 1 - 10. The default value is 3.

hops-timeout
Specifies the number of seconds that the big3d daemon waits for a probe. Valid values are 1 - 10. The default value is 3.

inactive-ldns-ttl
Specifies the number of seconds that an inactive LDNS remains in the cache. Each time an LDNS makes a request, the clock starts again. Valid values are 60 - 31536000 (1 year). The default value is 2419200 (28 days).

ldns-update-interval
Specifies the number of seconds that a tmm will wait before sending an update for a LDNS which has been accessed. The default value is 20 seconds.

inactive-paths-ttl
Specifies the number of seconds that a path remains in the cache after its last access. Valid values are 60 - 31536000 (1 year). The default value is 604800 (7 days).

max-synchronous-monitor-requests
Specifies how many monitors can attempt to verify the availability of a given resource at the same time. The default value is 20.

metrics-caching
Specifies the interval (in seconds) at which the system dumps path and other metrics data. Valid values are 0 through 604800. The default value is 3600; 0 (zero) turns this feature off.

metrics-collection-protocols
Specifies the protocols that the system uses to collect metrics information relevant to LDNS servers.

path-ttl
Specifies the number of seconds that the system considers path data to be valid for name resolution and load balancing purposes. The default value is 2400. Note that this option must be greater than the paths-retry option and less than or equal to 2419200 (28 days).

paths-retry
Specifies the interval (in seconds) at which the system retries the path data. Valid values are 1 - 600 (10 minutes). The default value is 120.

DELETE
delete link [name]

DESCRIPTION
You can use the link component to create, display, modify, or delete a link.

A link is a physical device that connects the network to the rest of the Internet. You can logically attach links to a collection of servers in order to manage access to the data sources on the network.

EXAMPLES
create link my_link datacenter DC1 router-addresses add {10.10.1.1}

Creates a link named my_link in the DC1 data center and adds the IP address of the router that uses this link.

list link non-default-properties

Displays all non-default properties for all links.

delete link my_link

Deletes the link named my_link.

show link my_link detail

Show the servers and virtual servers associated with my_link.

show link all detail

Show the servers and virtual servers associated with each respective link in the system.

OPTIONS

app-service
Specifies the name of the application service to which the link belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the link. Only the application service can modify or delete the link.

cost-segments
Specifies the cost of each incremental segment of bandwidth. This option is valid only when the weighting option is set to price. Note that you cannot modify the list, only replace all of the options in the list.

By default, the list is empty. The options are:

dollars-per-mps
Specifies the cost in dollars per megabytes per second. By default this value is not specified.

up-to-bps
Specifies the cost in dollars per bytes per second. By default this value is not specified.

datacenter
Specifies the data center to which the link belongs.

description
User defined description.

detail
The detail option is used with the show display command. This shows the server IP addresses and virtual servers associated with this link. A server can have multiple server IP addresses, however, only the server IP addresses that use this link will be displayed. Assignment information for servers and virtuals will not be displayed if there are not any servers or virtuals that use this link. By default, links are automatically matched to server IP addresses and virtual servers according to their IP addresses. Explicit links may also be defined. How this link was assigned is displayed under the Link Assignment column: auto means that the system automatically assigned this link, and explicit means that the link was explicitly set by the user.

[disabled | enabled]
Specifies whether the link and its resources are available for load balancing. The default value is enabled.

duplex-billing
Enables or disables duplex billing for this link. The default value is enabled. This option is valid only when the weighting option is set to price.

disabled
The internet service provider (ISP) that supplies this link bills for bandwidth usage based on the total amount of inbound plus outbound traffic on the link.

enabled
The ISP that supplies this link bills for bandwidth usage based on the maximum amount of either inbound or outbound traffic on the link (whichever is higher), rather than billing for bandwidth usage based on the total amount of inbound plus outbound traffic on the link.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

limit-max-inbound-bps
Specifies the threshold for inbound traffic on the link. The default value is 0 (zero).

limit-max-inbound-bps-status
Enables or disables the **limit-max-inbound-bps** option for this link. The default value is disabled.

limit-max-outbound-bps
Specifies the threshold for inbound traffic on the link. The default value is 0 (zero).

limit-max-outbound-bps-status
Enables or disables the **limit-max-outbound-bps** option for this link. The default value is disabled.

limit-max-total-bps
Specifies the threshold as a sum of inbound and outbound traffic on the link. The default value is 0 (zero).

limit-max-total-bps-status
Enables or disables the **limit-max-total-bps** option for this link. The default value is disabled.

link-ratio
Specifies the frequency at which the system sends traffic through the link. The default value is 1.

Important: When you set this option, you must also set the **weighting** option to **ratio**.

monitor
Specifies the health monitors that the system uses to determine whether this link is available for load balancing. Multiple monitors may be specified with the **and** keyword. The **min** keyword is used to specify the minimum number of monitors that must succeed for this link to be declared up. The default value is none.

name Specifies a unique name for the component. This option is required for the commands **create** and **modify**.

prepaid-segment
Specifies the amount of bandwidth for which the system is prepaid. This option is valid only when the **weighting** option is set to **price**. The default value is 0 (zero).

regex
Displays the items that match the regular expression. The regular expression must be preceded by an **@** sign (**@[regular expression]**) to indicate that the identifier is a regular expression. See **help regex** for a description of regular expression syntax.

router-addresses
Specifies the IP addresses of the routers that use this link. A router address can be associated with only one link. You can use the following options:

app-service
Specifies the name of the application service to which the link belongs. The default value is none. Note: If the **strict-updates** option is enabled on the application service that owns the object, you cannot modify or delete the link. Only the application service can modify or delete the link.

description
User defined description.

device-name
Deprecated in v13.0.0 Specifies the name of the device associated with this link. Defaults to none.

translation
Specifies the address that the link uses for translation when communicating between the network and the Internet. The default value is any6.

service-provider
Specifies the Internet Service Provider (ISP) or vendor that supplies this link. This allows you to provide a name or description that helps identify this link out of your data center. This is an optional field.

uplink-address
Specifies the IP address the system uses to gather Simple Network Management Protocol (SNMP) metrics from the router interface. When you configure an uplink address, the system sends SNMP requests to the IP addresses configured using the **router-addresses** option for this link.

weighting
Specifies the weighting methodology the system uses to select a link to which to send traffic. The default value is **ratio**. The options are:

price
The system continuously checks the performance of each link, and sends traffic through the link with the best performance data.

ratio
The system uses the value that you set in the **link-ratio** option to determine the link to which to send traffic.

field-fmt

DELETE
delete listener [name]

DESCRIPTION

You can use the listener component to create, display, modify, or delete a listener.

A listener is an object that listens for DNS queries. Listeners are defined for specific IP addresses, and are always associated with port 53.

Important: When you create, modify, or delete a listener, the system saves the running configuration in the stored configuration files.

EXAMPLES

```
create listener my_listener address 10.10.1.1 persist replace-all-with  
{ source_addr }
```

Creates a listener named `my_listener` with an IP address of 10.10.1.1, which uses the source address persistence method.

```
modify listener my_listener profiles replace-all-with { dns }
```

Replaces the profiles associated with the listener `my_listener`.

Note: To replace the profile associated with a listener, you must enclose the name of the new profile in curly brackets.

```
list listener non-default-properties
```

Displays all non-default properties for all listeners.

```
delete listener my_listener
```

Deletes the listener named `my_listener`.

OPTIONS

address

Specifies the IP address on which the system listens. The system receives traffic sent to this IP address and processes it as needed. This option is required.

advertise

Specifies whether to advertise the listener address to surrounding routers. The options are `yes` or `no`. The default value is `no`.

app-service

Specifies the name of the application service to which the listener belongs. The default value is `none`. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the listener. Only the application service can modify or delete the listener.

context

Specifies that the protocol profile is either a `clientside` or `serverside` profile. If not specified, the default value is `all` for both sides.

description

User defined description.

(enabled | disabled)

Specifies the state of the listener. The default value is `enabled`.

Note: When you disable a listener, the listener no longer accepts new connection requests. However, it allows current connections to finish processing before going to a down state.

fallback-persistence

Specifies a fallback persistence profile for the listener to use when the default persistence profile is not available. The default value is `none`.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

ip-protocol

Specifies the protocol on which this listener receives network traffic. The options are `udp` or `tcp`. The default value is `udp`.

last-hop-pool

Specifies the name of the last hop pool that you want the listener to use to direct reply traffic to the last hop router. The default value is `none`.

`mask` Specifies the netmask for a network listener only. This setting is required for a network listener.

The netmask clarifies whether the host bit is an actual zero or a wildcard representation. The default value is `255.255.255.255` for IPv4 or `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff` for IPv6.

`name` Specifies a unique name for the component. This option is required for the commands `create` and `modify`.

partition

Displays the administrative partition within which the listener resides.

persist

Specifies a list of profiles separated by spaces that the listener uses to manage connection persistence. The default value is none.

To enable persistence, typically you specify a single profile. However, you can specify multiple profiles in conjunction with iRules(r) that define a persistence strategy based on incoming traffic. In the case of multiple profiles, the default option specifies which profile you want the listener to use if an iRule does not specify a persistence method. When you specify multiple profiles, the default value of the default property is no. You can set the value of the default property to yes for only one of the profiles.

pool Specifies a default pool to which you want the listener to automatically direct traffic. The default value is none.

port Specifies the service port on which the listener listens for connections. When you create a listener, the default value is 53 if no port number is specified.

profiles

Specifies the DNS, statistics and protocol profiles to use for this listener. When a listener is created, if a DNS profile is not specified, the generic "dns" profile is added. If a protocol profile is not specified, then the generic "tcp" profile is added for TCP and the "udp_gtm_dns" profile is added for UDP. A listener always has DNS and protocol profiles once it is created. Only a statistics profile can be added to or deleted from a listener.

The replace-all-with command replaces the profiles with the specified ones. The unspecified DNS and protocol profiles are not changed. If statistics profiles are not specified, the replace-all-with command removes the existing statistics profile from the listener. When the protocol is modified, if profiles are not specified, a default protocol profile is used. DNS and statistics profiles will not change.

rules

Specifies a list of iRules, separated by spaces, that customize the listener to direct and manage traffic. The default value is none.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

source-address-translation

Specifies the type of source address translation enabled for the listener as well as the pool that the source address translation will use.

pool Specifies the name of a SNAT pool used by the specified listener.

type Specifies the type of source address translation associated with the specified listener.

The options are:

automap

Specifies the use of self IP addresses for listener source address translation.

none Specifies no source address translation to be used by the listener.

snat Specifies the use of a SNAT pool of translation addresses for listener source address translation.

source-port

Specifies whether the system preserves the source port of the connection. The default value is preserve.

The options are:

change

Obfuscates internal network addresses.

preserve

Preserves the source port of the connection.

preserve-strict

Use this value only for UDP under very special circumstances, such as nPath or transparent (that is, no translation of any other L3/L4 field), where there is a 1:1 relationship between virtual IP addresses and node addresses, or when clustered multi-processing (CMP) is disabled.

translate-address

Enables or disables address translation for the listener. Disable address translation for a listener if you want to use the listener to load balance connections to any address. This option is useful when the system is load balancing devices that have the same IP address. The default value is disabled.

translate-port

Enables or disables port translation. Disable port translation for a listener, if you want to use the listener to load balance connections to any service. The default value is disabled.

vlan

Specifies a list of VLANs on which traffic is either disabled or

enabled, based on whether the vlans-disabled or vlans-enabled option is specified.

vlans-disabled

Specifies that traffic is not accepted by this listener on the VLANs specified in the vlans option. This option is mutually exclusive with the vlans-enabled option.

vlans-enabled

Specifies that traffic is accepted by this listener on only the VLANs specified in the vlans option. This option is mutually exclusive with the vlans-disabled option.

BIG-IP 2016-03-14 gtm listener(1)

gtm monitor bigip-link

NAME

bigip-link - Configures a BIG-IP(r) Link monitor.

MODULE

gtm monitor

SYNTAX

Configure the bigip-link component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create bigip-link [name]
modify bigip-link [name]
options:
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  destination [ip address]
  ignore-down-response [enabled | disabled]
  interval [integer]
  timeout [integer]
```

```
edit bigip-link [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list bigip-link
list bigip-link [ [name] | [glob] | [regex] ] ... ]
show running-config bigip-link
show running-config bigip-link [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete bigip-link [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the bigip-link component to configure a custom monitor, or you can use the default BIG-IP Link monitor that the Global Traffic Manager provides. This type of monitor acquires data captured through monitors managed by a BIG-IP Link Controller.

EXAMPLES

```
create bigip-link my_bigip-link defaults-from bigip_link
```

Creates a monitor named my_bigip-link that inherits properties from the default BIG-IP Link monitor.

```
list bigip-link
```

Displays the properties of all of the BIG-IP Link monitors.

OPTIONS

app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is bigip_link.

description

User defined description.

destination

Specifies the IP address of the resource that is the destination of this monitor. The default value is *.

Possible values are:

* Specifies to perform a health check on the IP address of the node.

IP address

Specifies to perform a health check on the IP address that you specify, route the check through the IP address of the associated node, and mark the IP address of the associated node up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 30 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

SEE ALSO

create, delete, edit, glob, gtm link, list, ltm node, modify, regex, show, tmsh,

COPYRIGHT

BIG-IP 2012-10-19 gtm monitor bigip-link(1)

gtm monitor bigip

NAME

bigip - Configures a BIG-IP(r) monitor.

MODULE

gtm monitor

SYNTAX

Configure the bigip component within the gtm monitor module using the syntax in the following sections.

```

CREATE/MODIFY
create bigip [name]
modify bigip [name]
options:
  aggregate-dynamic-ratios [average-members | average-nodes | none |
    sum-members | sum-nodes]
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  timeout [integer]

edit bigip [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default properties

DISPLAY
list bigip
list bigip [ [name] | [glob] | [regex] ] ... ]
show running-config bigip
show running-config bigip [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete bigip [name]

```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the bigip component in the gtm monitor module to configure a custom monitor, or you can use the default BIG-IP(r) monitor that the Global Traffic Manager(tm) provides. The BIG-IP monitor is both a health and performance monitor. This type of monitor acquires data captured through monitors managed by a BIG-IP Local Traffic Manager(tm).

You can monitor only the following components with a BIG-IP monitor:

- Global Traffic Manager server
- Global Traffic Manager virtual server
- Local Traffic Manager server
- Local Traffic Manager virtual server

EXAMPLES

```
create bigip my_bigip defaults-from bigip
```

Creates a monitor named my_bigip that inherits properties from the default BIG-IP monitor.

```
list bigip
```

Displays the properties of all of the BIG-IP monitors.

OPTIONS

aggregate-dynamic-ratios
Specifies the monitor's response to a query. By default, the BIG-IP monitor uses the gtm_score value as the vs_score for a Local Traffic Manager virtual server.

You can use this option to override the default behavior using the following values:

average-members
Specifies that the monitor uses the average of the dynamic ratio values of the pool members associated with the pools that are associated with the virtual server as a response to a query.

average-nodes
Specifies that the monitor uses the average value of all of the nodes associated with the pool members that are associated with the pools that are associated with the virtual server as a response to a query.

none This is the default value.

sum-members
Specifies that the monitor uses the sum of the pool members as a response to a query.

sum-nodes
Specifies that the monitor uses the sum of the dynamic ratios of all of the nodes as a response to a query.

app-service
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is bigip.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the address and port supplied by a virtual server.

*:port
Specifies to perform a health check on the virtual server with the IP address supplied by the virtual server and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the virtual server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 90 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

BIG-IP 2017-08-15 gtm monitor bigip(1)

gtm monitor external

NAME
external - Configures an external monitor.

MODULE
gtm monitor

SYNTAX
Configure the external component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create external [name]
modify external [name]
options:
args [[arguments] | none]
defaults-from [name]
description [string]
destination [[ipv4 address[:port]] | [ipv6 address[:port]]]
ignore-down-response [enabled | disabled]

```
interval [integer]
probe-timeout [integer]
run [none | [external monitor] ]
timeout [integer]
user-defined [ [name] [value] | [name] none ]

edit external [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list external
list external [ [ [name] | [glob] | [regex] ] ... ]
show running-config external
show running-config external [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete external [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the external component to configure a custom monitor, or you can use the default external monitor that the Global Traffic Manager provides. You can use this type of monitor to monitor services using your own programs.

EXAMPLES

```
create external my_external defaults-from external
```

Creates a monitor named `my_external` that inherits properties from the default external monitor.

```
list external
```

Displays the properties of all of the external monitors.

OPTIONS

`args` Specifies any command-line arguments that the external program requires. The default value is none.

`defaults-from`
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `external`.

`description`
User defined description.

`destination`
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

`*:port`
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`ignore-down-response`
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

`interval`
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`
Displays the administrative partition within which the component resides.

`probe-timeout`
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

`regex`
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`run` Specifies the external monitor file to be executed by the external monitor. The default value is none.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

user-defined
Specifies any user-defined command-line arguments and variables that the external program requires. Use the following syntax to specify a user defined parameter.

```
modify external my_external user-defined my_param_name
my_param_value
```

Use the following syntax to remove a user defined parameter.

```
modify external my_external user-defined my_param_name none
```

BIG-IP 2017-08-15 gtm monitor external(1)

gtm monitor firepass

NAME
firepass - Configures a FirePass(r) monitor.

MODULE
gtm monitor

SYNTAX
Configure the firepass component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create firepass [name]
modify firepass [name]
options:
app-service [[string] | none]
cipherlist [list]
concurrency-limit [integer]
defaults-from [name]
description [string]
destination [[ipv4 address[:port]] | [ipv6 address[:port]]]
ignore-down-response [enabled | disabled]
interval [integer]
max-load-average [floating point value]
password [none | [password]]
probe-timeout [integer]
timeout [integer]
username [name]

edit firepass [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list firepass
list firepass [[[name] | [glob] | [regex]] ...]
show running-config firepass
show running-config firepass [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DELETE
delete firepass [name]

Note: You cannot delete default monitors.

DESCRIPTION

You can use the firepass component to configure a custom monitor, or you can use the default FirePass monitor that the BIG-IP(r) Global Traffic Manager(tm) provides. The FirePass monitor is both a health and

performance monitor.

For more information about configuring monitors, refer to the Configuration Guide for BIG-IP(r) Global Traffic Management.

EXAMPLES

```
create firepass my_firepass defaults-from firepass_gtm
```

Creates a monitor named `my_firepass` that inherits properties from the default FirePass monitor.

```
list firepass
```

Displays the properties of all of the FirePass monitors.

OPTIONS

`app-service`

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

`cipherlist`

Specifies the list of ciphers for this monitor. The default value is `HIGH:!ADH`.

`concurrency-limit`

Specifies the maximum percentage of licensed connections currently in use under which the monitor marks the FirePass system up. The default value is 95.

For example, a value of 95 percent means that the monitor marks the FirePass system up until 95 percent of licensed connections are in use. When the number of in-use licensed connections exceeds 95 percent, the monitor marks the FirePass system down.

`defaults-from`

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `firepass_gtm`.

`description`

User defined description.

`destination`

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the address and port supplied by a pool member.

`*:port`

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`

Specifies to mark a pool member up or down based on the response of the server at the address you supply.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`ignore-down-response`

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

`interval`

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`max-load-average`

Specifies the number that the monitor uses to mark the FirePass system up or down. The system compares value of this option against a one-minute average of the FirePass system load. When the FirePass system-load average falls within the specified value, the monitor marks the FirePass system up. When the average exceeds the setting, the monitor marks the system down.

The default value is 12.0.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`password`

Specifies the password, if the monitored target requires authentication. The default value is none.

`probe-timeout`

Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 90 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is gtmuser.

SEE ALSO

BIG-IP 2017-08-15 gtm monitor firepass(1)

gtm monitor ftp

NAME
ftp - Configures a File Transfer Protocol (FTP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the ftp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create ftp [name]
modify ftp [name]
options:
debug [no | yes]
defaults-from [name]
description [string]
destination [[ipv4 address[:port]] | [ipv6 address[.port]]]
filename [[filename] | none]
ignore-down-response [enabled | disabled]
interval [integer]
mode [passive | port]
password [none | [password]]
probe-timeout [integer]
timeout [integer]
username [name]

edit ftp [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list ftp
list ftp [[[name] | [glob] | [regex]] ...]
show running-config ftp
show running-config ftp [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DELETE
delete ftp [name]

Note: You cannot delete default monitors.

DESCRIPTION

You can use the ftp component to configure a custom monitor, or you can use the default FTP monitor that the Global Traffic Manager provides. This type of monitor verifies the FTP service by attempting to download a specific file to the /var/tmp directory on the system. Once downloaded successfully, the file is not saved.

EXAMPLES

create ftp my_ftp defaults-from ftp

Creates a monitor named my_ftp that inherits properties from the default FTP monitor.

list ftp

Displays the properties of all of the FTP monitors.

OPTIONS

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is ftp.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

filename

Specifies the full path and file name of the file that the system attempts to download. The health check is successful if the system can download the file. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

mode Specifies the data transfer process (DTP) mode. The default value is passive. The options are:

passive

Specifies that the monitor sends a data transfer request to the FTP server. When the FTP server receives the request, the FTP server then starts and establishes the data connection.

port Specifies that the monitor starts and establishes the data connection with the FTP server.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

password

Specifies the password, if the monitored target requires authentication. The default value is none.

partition

Displays the administrative partition within which the component resides.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2017-08-15 gtm monitor ftp(1)

gtm monitor gateway-icmp

NAME

gateway-icmp - Configures a Gateway Internet Control Message Protocol (ICMP) monitor.

MODULE

gtm monitor

SYNTAX

Configure the gateway-icmp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create gateway-icmp [name]
modify gateway-icmp [name]
options:
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  timeout [integer]
  transparent [enabled | disabled]
```

```
edit gateway-icmp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list gateway-icmp
list gateway-icmp [ [ [name] | [glob] | [regex] ] ... ]
show running-config gateway-icmp
show running-config gateway-icmp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete gateway-icmp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the gateway-icmp component to configure a custom monitor, or you can use the default Gateway ICMP monitor that the Global Traffic Manager provides. You can use a Gateway ICMP type of monitor for a virtual server, a server (that is, all of the virtuals on a specified server), a pool member, a pool (that is, all of the pool members of a specified pool), or a link.

EXAMPLES

```
create gateway-icmp my_icmp defaults-from gateway_icmp
```

Creates a monitor named my_icmp that inherits properties from the default Gateway ICMP monitor.

```
list gateway-icmp
```

Displays the properties of all of the Gateway ICMP monitors.

OPTIONS

defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is gateway_icmp.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

IP address:port (with the transparent option enabled)
Specifies to perform a health check on the server at the IP address and port specified in the monitor, routing the check through the IP address and port supplied by the pool member. The pool member (the gateway) is marked up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

probe-attempts
Specifies the number of times the BIG-IP(r) system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 3 attempts.

probe-interval
Specifies the frequency at which the BIG-IP system probes the host server. The default value is 1 second.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent
Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

SEE ALSO

create, delete, edit, glob, gtm link, gtm pool, gtm server, list, modify, regex, show, tmsb

COPYRIGHT

gtm monitor gtp

NAME
gtp - Configures a GPRS Tunneling Protocol (GTP) monitor. This monitor operates over UDP.

MODULE
gtp monitor

SYNTAX
Configure the gtp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create gtp [name]
modify gtp [name]
options:
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  protocol-version [integer]
  timeout [integer]
```

```
edit gtp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list gtp
list gtp [ [name] | [glob] | [regex] ] ... ]
show running-config gtp
show running-config gtp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete gtp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the gtp component to configure a custom monitor, or you can use the default GTP monitor that the Global Traffic Manager provides. This type of monitor verifies the GPRS tunneling service by attempting to send GTP Echo Requests to a pool, pool member, or virtual server, and verifying the receipt of a well-formed Echo Response packet. This monitor supports GTP version 1 and version 2 over UDP.

For more information about configuring monitors, refer to the Configuration Guide for BIG-IP(r) Global Traffic Management.

EXAMPLES

```
create gtp my_gtp defaults-from gtp
```

Creates a monitor named my_gtp that inherits properties from the default GTP monitor.

```
list gtp
```

Displays the properties of all of the GTP monitors.

OPTIONS

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is gtp.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

***:port**

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

probe-attempts

Specifies the number of times the BIG-IP system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 3.

probe-interval

Specifies the frequency at which the BIG-IP system probes the host server. The default value is 1.

probe-timeout

Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

protocol-version

Specifies the GTP protocol version used to perform the exchange. GTP version 1 and GTP version 2 are supported. The default is version 1.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds. If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a non-conforming Echo Reply, the system immediately flags the target as down without waiting for the timeout interval to expire.

SEE ALSO

create, delete, edit, glob, gtm pool, gtm server, list, modify, regex, show, tmsh

COPYRIGHT

BIG-IP 2017-08-15 gtm monitor gtp(1)

gtm monitor http

NAME

http - Configures a Hypertext Transfer Protocol (HTTP) monitor.

MODULE

gtm monitor

SYNTAX

Configure the http component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create http [name]
modify http [name]
options:
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  password [none | [password] ]
  probe-timeout [integer]
  recv [none | [string] ]
  reverse [enabled | disabled]
  send [none | [string] ]
  timeout [integer]
```

```

transparent [enabled | disabled]
username [ [name] | none]

edit http [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list http
list http [ [ [name] | [glob] | [regex] ] ... ]
show running-config http
show running-config http [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete http [name]

```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the http component to configure a custom monitor, or you can use the default HTTP monitor that the Global Traffic Manager provides. This type of monitor verifies the HTTP service by attempting to receive specific content from a Web page.

EXAMPLES

```
create http my_http defaults-from http
```

Creates a monitor named my_http that inherits properties from the default HTTP monitor.

```
list http
```

Displays the properties of all of the HTTP monitors.

OPTIONS

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is http.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

IP address:port (with the transparent option enabled)

Specifies to perform a health check on the server at the IP address and port specified in the monitor, routing the check through the IP address and port supplied by the pool member. The pool member (the gateway) is marked up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is

included in an HTML file on your site. The text string can be regular text, HTML tags, or image names, and the associated operation is not case-sensitive. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

reverse

Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored object down instead of up. You can use the this mode only if you configure both the send and recv options.

The default value is disabled, which specifies that the monitor does not operate in reverse mode. The enabled value specifies that the monitor operates in reverse mode.

send Specifies the text string that the monitor sends to the target object.

The default setting is GET /, which retrieves a default HTML file for a web site. To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html.

Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2017-08-15 gtm monitor http(1)

gtm monitor https

NAME

https - Configures a Hypertext Transfer Protocol over Secure Socket Layer (HTTPS) monitor.

MODULE

gtm monitor

SYNTAX

Configure the https component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create https [name]
modify https [name]
```

options:

```
cert [ [cert list] | none]
cipherlist [string]
compatibility [enabled | disabled]
```

```
defaults-from [name]
description [string]
destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
ignore-down-response [enabled | disabled]
interval [integer]
key [ [key] | none]
password [none | [password] ]
probe-timeout [integer]
recv [none | [string] ]
reverse [enabled | disabled]
send [none | [string] ]
timeout [integer]
transparent [enabled | disabled]
username [ [name] | none]
```

```
edit https [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list https
list https [ [ [name] | [glob] | [regex] ] ... ]
show running-config https
show running-config https [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete https [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the http component to configure a custom monitor, or you can use the default HTTPS monitor that the Global Traffic Manager provides. This type of monitor verifies the HTTPS service by attempting to receive specific content from a Web page protected by Secure Socket Layer (SSL) security.

EXAMPLES

```
create https my_https defaults-from https
```

Creates a monitor named `my_https` that inherits properties from the default HTTPS monitor.

```
list https
```

Displays the properties of all of the HTTPS monitors.

OPTIONS

`cert` Specifies a fully-qualified path for a client certificate that the monitor sends to the target SSL server. The default value is none.

`cipherlist`

Specifies the list of ciphers for this monitor. The default list `DEFAULT:+SHA:+3DES:+kEDH:!EXPORT` is located in the file `gtm_base_monitors.conf`.

`compatibility`

Specifies, when enabled, that the SSL options setting (in OpenSSL) is set to ALL. The default value is enabled.

`defaults-from`

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `https`.

`description`

User defined description.

`destination`

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

`*:port`

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`IP address:port (with the transparent option enabled)`

Specifies to perform a health check on the server at the IP address and port specified in the monitor, routing the check through the IP address and port supplied by the pool member. The pool member (the gateway) is marked up or down accordingly.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`ignore-down-response`

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

key Specifies the RSA private key if the monitored target requires authentication. The key must be surrounded by quotation marks, for example, `key \"client.key\"`. Note that if you specify a key, you must also specify a value for the `cert` option. The default value is `none`.

name Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is `none`.

probe-timeout

Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is `none`.

The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names, and the associated operation is not case-sensitive. If you do not specify a value for both the `send` and `recv` options, the monitor performs a simple service check and `connect` only.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@`[regular expression]) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

reverse

Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored object down instead of up. You can use the `this` mode only if you configure both the `send` and `recv` options.

The default value is `disabled`, which specifies that the monitor does not operate in reverse mode. The `enabled` value specifies that the monitor operates in reverse mode.

send Specifies the text string that the monitor sends to the target object. The default value is `GET /`, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, `GET /www/company/index.html`. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is `null`, then a valid connection suffices to determine that the service is up. In this case, the system does not need the `recv` option and ignores the option even if not `null`.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a `RESET` packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is `disabled`.

username

Specifies the username, if the monitored target requires authentication. The default value is `none`.

SEE ALSO

`create`, `delete`, `edit`, `glob`, `gtm pool`, `list`, `modify`, `regex`, `show`, `tmsh`

gtm monitor imap

NAME
imap - Configures an Internet Message Access Protocol (IMAP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the imap component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create imap [name]
modify imap [name]
options:
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  folder [ [name] | none]
  ignore-down-response [enabled | disabled]
  interval [integer]
  password [none | [password] ]
  probe-timeout [integer]
  timeout [integer]
  transparent [enabled | disabled]
  username [ [name] | none]
```

```
edit imap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list imap
list imap [ [ [name] | [glob] | [regex] ] ... ]
show running-config imap
show running-config imap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete imap [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the imap component to configure a custom monitor, or you can use the default IMAP monitor that the Global Traffic Manager provides. This type of monitor verifies IMAP by attempting to open a specified mail folder on a server. This monitor is similar to the POP3 monitor.

EXAMPLES

```
create imap my_imap defaults-from imap
```

Creates a monitor named `my_imap` that inherits properties from the default IMAP monitor.

```
list imap
```

Displays the properties of all of the IMAP monitors.

OPTIONS

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `imap`.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

***:port**
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

folder
Specifies the name of the folder on the IMAP server that the monitor tries to open. The default value is INBOX.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent
Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

SEE ALSO

BIG-IP 2017-08-15 gtm monitor imap(1)

gtm monitor ldap

NAME
ldap - Configures a Lightweight Directory Access Protocol (LDAP) monitor.

MODULE
gtm monitor

SYNTAX

Configure the ldap component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create ldap [name]
modify ldap [name]
options:
  base [none | [string] ]
  chase-referrals [ no | yes ]
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  filter [ [LDAP key] | none]
  ignore-down-response [enabled | disabled]
  interval [integer]
  mandatory-attributes [no | yes]
  password [none | [password] ]
  probe-timeout [integer]
  security [none | ssl | tls]
  timeout [integer]
  username [ [name] | none]
```

```
edit ldap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list ldap
list ldap [ [ [name] | [glob] | [regex] ] ... ]
show running-config ldap
show running-config ldap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete ldap [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the ldap component to configure a custom monitor, or you can use the default LDAP monitor that the Global Traffic Manager provides. This type of monitor verifies the LDAP service by attempting to authenticate the specified user.

EXAMPLES

```
create ldap my_ldap defaults-from ldap
```

Creates a monitor named my_ldap that inherits properties from the default LDAP monitor.

```
list ldap
```

Displays the properties of all of the LDAP monitors.

OPTIONS

base Specifies the location in the LDAP tree from which the monitor starts the health check. A sample value is dc=bigip-test,dc=net. The default value is none.

chase-referrals

Specifies whether the monitor upon receipt of an LDAP referral entry chases that referral. The default value is yes.

The options are:

no Specifies that the system will treat a referral entry as a normal entry and refrain from querying the remote LDAP server(s) pointed to by the referral entry.

yes Specifies that the system upon receiving any referral entry from the monitored LDAP server query, the system will then query the corresponding LDAP server(s) pointed to by the LDAP query. If the query for the referral is unsuccessful the system will mark the monitored LDAP server down.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is ldap.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

filter

Specifies an LDAP key for which the monitor searches. A sample value is objectclass=*. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

mandatory-attributes

Specifies whether the target must include attributes in its response to be considered up. The default value is no. The options are:

no Specifies that the system performs only a one-level search (based on the value of the filter option), and does not require that the target returns any attributes.

yes Specifies that the system performs a sub-tree search, and if the target returns no attributes, the target is considered down.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

security

Specifies the secure communications protocol that the monitor uses to communicate with the target. The default value is none.

The options are:

none Specifies that the system does not use a security protocol for communications with the target.

ssl Specifies that the system uses the SSL protocol for communications with the target.

tls Specifies that the system uses the TLS protocol for communications with the target.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

SEE ALSO

create, delete, edit, glob, gtm pool, list, modify, regex, show, tmsh

BIG-IP 2017-08-15 gtm monitor ldap(1)

gtm monitor mssql

NAME
mssql - Configures a Microsoft(r) Windows(r) Structured Query Language (MSSQL) monitor.

MODULE
gtm monitor

SYNTAX
Configure the mssql component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create mssql [name]
modify mssql [name]
options:
count [0 | 1]
database [[name] | none]
debug [no | yes]
defaults-from [name]
description [string]
destination [[ipv4 address[:port]] | [ipv6 address[.port]]]
ignore-down-response [enabled | disabled]
interval [integer]
password [none | [password]]
probe-timeout [integer]
recv [none | [string]]
recv-column [none | [string]]
recv-row [none | [string]]
send [none | [string]]
timeout [integer]
username [[name] | none]

edit mssql [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list mssql
list mssql [[[name] | [glob] | [regex]] ...]
show running-config mssql
show running-config mssql [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line
partition

DELETE
delete mssql [name]

Note: You cannot delete default monitors.

DESCRIPTION
You can use the mssql component to configure a custom monitor, or you can use the default MSSQL monitor that the Global Traffic Manager provides. This type of monitor verifies Microsoft Windows SQL-based services.

EXAMPLES
create mssql my_mssql defaults-from mssql

Creates a monitor named my_mssql that inherits properties from the default MSSQL monitor.

list mssql

Displays the properties of all of the MSSQL monitors.

OPTIONS
count
Specifies the number of instances for which the system keeps a connection open. By default, when you assign instances of this monitor to a resource, the system keeps the connection to the database open. With this option you can assign multiple instances to the database while reducing the overhead that multiple open connections can cause.

A value of 0 (zero), the default, keeps the connection open for all instances. A value of 1 opens a new connection for each

instance. Any other positive value keeps the connection open for that many instances; for example, a value of 5 keeps the connection open for five instances of this monitor.

database

Specifies the name of the database with which the monitor attempts to communicate. The default value is none.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is mssql.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

***:port**

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in a field in your database. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

recv-column

Specifies the column in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

recv-row

Specifies the row in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

send Specifies the SQL query that the monitor sends to the target database, for example, SELECT count(*) FROM mytable.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 91 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

gtm monitor mysql

NAME

mysql - Configures a MySQL(r) monitor.

MODULE

gtm monitor

SYNTAX

Configure the mysql component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create mysql [name]
modify mysql [name]
options:
  count [0 | 1]
  database [ [name] | none]
  debug [no | yes]
  defaults-from {name}
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  password [none | [password] ]
  probe-timeout [integer]
  recv [none | [string] ]
  recv-column [none | [string] ]
  recv-row [none | [string] ]
  send [none | [string] ]
  timeout [integer]
  username [ [name] | none]
```

```
edit mysql [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list mysql
list mysql [ [ [name] | [glob] | [regex] ] ... ]
show running-config mysql
show running-config mysql [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete mysql [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the mysql component to configure a custom monitor, or you can use the default MySQL monitor that the Global Traffic Manager provides. This type of monitor verifies Microsoft(r) Windows(r) SQL-

based services.

EXAMPLES

```
create mysql my_mysql defaults-from mysql
```

Creates a monitor named `my_mysql` that inherits properties from the default MySQL monitor.

```
list mysql
```

Displays the properties of all of the MySQL monitors.

OPTIONS

`count`

Specifies the number of instances for which the system keeps a connection open. By default, when you assign instances of this monitor to a resource, the system keeps the connection to the database open. With this option you can assign multiple instances to the database while reducing the overhead that multiple open connections can cause.

A value of 0 (zero), the default, keeps the connection open for all instances. A value of 1 opens a new connection for each instance. Any other positive value keeps the connection open for that many instances; for example, a value of 5 keeps the connection open for five instances of this monitor.

`database`

Specifies the name of the database with which the monitor attempts to communicate. The default value is none.

`debug`

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

`defaults-from`

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `mysql`.

`description`

User defined description.

`destination`

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

`*:port`

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`ignore-down-response`

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

`interval`

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`password`

Specifies the password if the monitored target requires authentication. The default value is none.

`probe-timeout`

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

`recv` Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in a field in your database. If you do not specify a value for both the `send` and `recv` options, the monitor performs a

simple service check and connect only.

recv-column

Specifies the column in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

recv-row

Specifies the row in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

send Specifies the SQL query that the monitor sends to the target database, for example, `SELECT count(*) FROM mytable`.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 91 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2017-08-15 gtm monitor mysql(1)

gtm monitor nntp

NAME

nntp - Configures a Network News Transfer Protocol (NNTP) monitor.

MODULE

gtm monitor

SYNTAX

Configure the nntp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create nntp [name]
modify nntp [name]
options:
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  newsgroup [ [name] | none]
  password [none | [password] ]
  probe-timeout [integer]
  timeout [integer]
  username [ [name] | none]
```

```
edit nntp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list nntp
```

```
list nntp [ [ [name] | [glob] | [regex] ] ... ]
show running-config nntp
show running-config nntp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete nntp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the nntp component to configure a custom monitor, or you can use the default NNTP monitor that the Global Traffic Manager provides. This type of monitor verifies the Usenet News protocol service by attempting to retrieve a newsgroup identification string from the server.

EXAMPLES

```
create nntp my_nntp defaults-from nntp
```

Creates a monitor named my_nntp that inherits properties from the default NNTP monitor.

```
list nntp
```

Displays the properties of all of the NNTP monitors.

OPTIONS

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is nntp.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

newsgroup

Specifies the name of the newsgroup that you are monitoring, for example alt.car.mercedes. The default value is none.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

SEE ALSO

create, delete, edit, glob, gtm pool, list, modify, regex, show, tmsh

COPYRIGHT

BIG-IP 2017-08-15 gtm monitor nntp(1)

gtm monitor none

NAME

none - A base level NULL monitor used to indicate that no monitoring will be performed.

MODULE

gtm monitor

SYNTAX

The none component within the gtm monitor module can be used only with the syntax described in the following sections.

DISPLAY

```
list none
list none [ [ [name] | [glob] | [regex] ] ... ]
show running-config none
show running-config none [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

CREATE/MODIFY/DELETE

Note: You cannot create a custom monitor based off of the none monitor nor can you modify or delete the existing default none monitor.

DESCRIPTION

The none component is used to configure a GTM pool member that explicitly does not inherit its parent pool's monitor and remains unmonitored, regardless of the monitor setting on the parent pool.

EXAMPLES

```
create gtm pool a test_pool monitor http members add { test:vs_1 {
monitor none } test:vs_2 { } }
```

Creates a gtm pool with an http monitor that has two members, vs_1 and vs_2. The pool member vs_1 is configured with the none monitor so it does not inherit http monitoring from its parent pool, whereas pool member vs_2 will inherit and use its parent's http monitor.

OPTIONS

Note: While the following options are specified as part of the definition of the none monitor, they cannot be changed since the none monitor is used to define the absence of a monitor, not an actual monitor.

app-service

Displays the application service to which the object belongs. The permanent value is none. Note: Regardless if the strict-updates option is enabled, you cannot modify or delete the object; these are unavailable options for the none monitor.

defaults-from

Specifies the name of the monitor from which this monitor inherits settings. The default value is none.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *:6666, also shown as *:ircu-2.

ignore-down-response
Specifies whether this monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 0 seconds.

partition
Displays the administrative partition within which the component resides. The default value is Common.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 0 seconds.

time-until-up
Specifies the amount of time in seconds after the first successful response before a node is marked up. A value of 0 causes a node to be marked up immediately after a valid response is received from the node. The default value is 86500.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 0 seconds.

up-interval
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0, which specifies that the system uses the value of the interval option whether the resource is up or down.

SEE ALSO

BIG-IP 2017-08-29 gtm monitor none(1)

gtm monitor oracle

NAME
oracle - Configures an Oracle(r) monitor.

MODULE
gtm monitor

SYNTAX
Configure the oracle component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create oracle [name]
modify oracle [name]
options:
  count [0 | 1]
  database [ [name] | none]
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  password [none | [password] ]
  probe-timeout [integer]
  recv [none | [string] ]
  recv-column [none | [string] ]
  recv-row [none | [string] ]
  send [none | [string] ]
  timeout [integer]
  username [ [name] | none]
```

```
edit oracle [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list oracle
list oracle [ [name] | [glob] | [regex] ] ... ]
show running-config oracle
show running-config oracle [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
partition
```

```
DELETE
delete oracle [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the oracle component to configure a custom monitor, or you can use the default Oracle monitor that the Global Traffic Manager provides. This type of monitor verifies services based on Oracle by attempting to perform an Oracle login to a service.

EXAMPLES

```
create oracle my_oracle defaults-from oracle
```

Creates a monitor named my_oracle that inherits properties from the default Oracle monitor.

```
list oracle
```

Displays the properties of all of the Oracle monitors.

OPTIONS

count

Specifies the number of instances for which the system keeps a connection open. By default, when you assign instances of this monitor to a resource, the system keeps the connection to the database open. With this option you can assign multiple instances to the database while reducing the overhead that multiple open connections can cause.

A value of 0 (zero), the default, keeps the connection open for all instances. A value of 1 opens a new connection for each instance. Any other positive value keeps the connection open for that many instances; for example, a value of 5 keeps the connection open for five instances of this monitor.

database

Specifies the name of the database with which the monitor attempts to communicate. The default value is none.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is oracle.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in a field in your database. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

recv-column
Specifies the column in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

recv-row
Specifies the row in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

send Specifies the SQL query that the monitor sends to the target database, for example, SELECT count(*) FROM mytable.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 91 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2017-08-15 gtm monitor oracle(1)

gtm monitor pop3

NAME
pop3 - Configures a Post Office Protocol version 3 (POP3) monitor.

MODULE
gtm monitor

SYNTAX
Configure the pop3 component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create pop3 [name]
modify pop3 [name]

```
options:
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  password [none | [password] ]
  probe-timeout [integer]
  timeout [integer]
  username [ [name] | none]
```

```
edit pop3 [ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list pop3
```

```
list pop3 [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config pop3
```

```
show running-config pop3 [ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete pop3 [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the pop3 component to configure a custom monitor, or you can use the default POP3 monitor that the Global Traffic Manager provides. This type of monitor verifies the POP3 service by attempting to connect to a pool, pool member, or virtual server, log on as the specified user, and log off.

EXAMPLES

```
create pop3 my_pop3 defaults-from pop3
```

Creates a monitor named my_pop3 that inherits properties from the default POP3 monitor.

```
list pop3
```

Displays the properties of all of the POP3 monitors.

OPTIONS

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is pop3.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2017-08-15 gtm monitor pop3(1)

gtm monitor postgresql

NAME
postgresql - Configures a PostgreSQL(r) monitor.

MODULE
gtm monitor

SYNTAX
Configure the postgresql component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create postgresql [name]
modify postgresql [name]
options:
count [0 | 1]
database [[name] | none]
debug [no | yes]
defaults-from [name]
description [string]
destination [[ipv4 address[:port]] | [ipv6 address[.port]]]
ignore-down-response [enabled | disabled]
interval [integer]
password [none | [password]]
probe-timeout [integer]
recv [none | [string]]
recv-column [none | [string]]
recv-row [none | [string]]
send [none | [string]]
timeout [integer]
username [[name] | none]

edit postgresql [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list postgresql
list postgresql [[[name] | [glob] | [regex]] ...]
show running-config postgresql

```
show running-config postgresql [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete postgresql [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the postgresql component to configure a custom monitor, or you can use the default PostgreSQL monitor that the Global Traffic Manager provides. This type of monitor verifies Microsoft(r) Windows(r) SQL-based services.

EXAMPLES

```
create postgresql my_postgresql defaults-from postgresql
```

Creates a monitor named my_postgresql that inherits properties from the default PostgreSQL monitor.

```
list postgresql
```

Displays the properties of all of the PostgreSQL monitors.

OPTIONS

count
Specifies the number of instances for which the system keeps a connection open. By default, when you assign instances of this monitor to a resource, the system keeps the connection to the database open. With this option you can assign multiple instances to the database while reducing the overhead that multiple open connections can cause.

A value of 0 (zero), the default, keeps the connection open for all instances. A value of 1 opens a new connection for each instance. Any other positive value keeps the connection open for that many instances; for example, a value of 5 keeps the connection open for five instances of this monitor.

database
Specifies the name of the database with which the monitor attempts to communicate. The default value is none.

debug
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is postgresql.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

. Specifies to perform a health check on the IP address and port supplied by a pool member.

***:port**
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in a field in your database. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

recv-column

Specifies the column in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

recv-row

Specifies the row in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

send Specifies the SQL query that the monitor sends to the target database, for example, SELECT count(*) FROM mytable.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 91 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username

Specifies the username, if the monitored target requires authentication. The default value is none.

  non-default-properties

DISPLAY
list radius-accounting
list radius-accounting [ [ [name] | [glob] | [regex] ] ...]
show running-config radius
show running-config radius [ [ [name] | [glob] | [regex] ] ...]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete radius-accounting [name]

```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the radius-accounting component to configure a custom monitor, or you can use the default RADIUS accounting monitor that the Global Traffic Manager provides. This type of monitor provides information about the usage of the RADIUS service for accounting purposes.

EXAMPLES

```
create radius-accounting my_radius_acct defaults-from radius_accounting
```

Creates a monitor named `my_radius_acct` that inherits properties from the default RADIUS accounting monitor.

```
list radius-accounting
```

Displays the properties of all of the RADIUS accounting monitors.

OPTIONS

app-service

Specifies the name of the application service to which this monitor belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete this monitor. Only the application service can modify or delete this monitor.

check-until-up

When enabled, specifies that when an active and passive (inband) monitor are combined in an AND type of rule, the active monitor performs health checks only when the pool member is down, or until the pool member is marked as up. When the passive monitor marks the pool member down, the active monitor resumes health checks.

The default value is disabled.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `radius`.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*.*`.

Possible values are:

`*.*` Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the

response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

manual-resume
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nas-ip-address
Specifies the network access server IP address that the system uses to identify itself to the RADIUS server. Using this option, multiple BIG-IP(r) systems can appear as a single network access device to the RADIUS server. The default value is none.

partition
Displays the administrative partition within which the component resides.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret
Specifies the secret the monitor needs to communicate with the resource. The default value is none.

time-until-up
Specifies the amount of time in seconds after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

BIG-IP 2016-06-29 gtm monitor radius-accounting(1)

gtm monitor radius

NAME
radius - Configures a Remote Access Dial-in User Service (RADIUS) monitor.

MODULE
gtm monitor

SYNTAX
Configure the radius component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create radius [name]
modify radius [name]
options:
  app-service [[string] | none]
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  nas-ip-address [ [ip address] | none]
  password [none | [password] ]
  probe-timeout [integer]
  secret [none | [secret] ]
  timeout [integer]
  username [ [name] | none]
```

```
edit radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list radius
list radius [ [ [name] | [glob] | [regex] ] ... ]
show running-config radius
show running-config radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete radius [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the radius component to configure a custom monitor, or you can use the default RADIUS monitor that the Global Traffic Manager provides. This type of monitor verifies the RADIUS service by attempting to authenticate the specified user.

EXAMPLES

```
create radius my_radius defaults-from radius
```

Creates a monitor named my_radius that inherits properties from the default RADIUS monitor.

```
list radius
```

Displays the properties of all of the RADIUS monitors.

OPTIONS

app-service

Specifies the name of the application service to which this monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this monitor. Only the application service can modify or delete this monitor.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is radius.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

. Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nas-ip-address
Specifies the network access server IP address that the system uses to identify itself to the RADIUS server. Using this option, multiple BIG-IP(r) systems can appear as a single network access device to the RADIUS server. The default value is none.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret
Specifies the secret the monitor needs to communicate with the resource. The default value is none.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

username
Specifies the username, if the monitored target requires authentication. The default value is none.

SEE ALSO

BIG-IP 2017-08-15 gtm monitor radius(1)

gtm monitor real-server

NAME
real-server - Configures a RealServer(r) monitor.

MODULE
gtm monitor

SYNTAX
Configure the real-server component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create real-server [name]
modify real-server [name]
options:
defaults-from [name]
description [string]
ignore-down-response [enabled | disabled]
interval [integer]
metrics [[metrics] | none]

```

    probe-timeout [integer]
    timeout [integer]

edit real-server [ [ [name] | [glob] | [regex] ] ... ]
options:
    all-properties
    non-default-properties

DISPLAY
list real-server
list real-server [ [ [name] | [glob] | [regex] ] ... ]
show running-config real-server
show running-config real-server [ [ [name] | [glob] | [regex] ] ... ]
options:
    agent
    all-properties
    command
    method
    non-default-properties
    one-line
    partition

DELETE
delete real-server [name]

```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the real-server component to configure a custom monitor, or you can use the default RealServer monitor that the Global Traffic Manager provides. This type of monitor checks the performance of a pool, pool member, or virtual server that is running the RealServer data collection agent, and then dynamically load balances traffic accordingly.

EXAMPLES

```
create real-server my_real-server defaults-from real_server
```

Creates a monitor named `my_real-server` that inherits properties from the default RealServer monitor.

```
list real-server
```

Displays the properties of all of the RealServer monitors.

OPTIONS

agent

Displays the agent for the monitor. The default agent is Mozilla/4.0 (compatible: MSIE 5.0; Windows NT). You cannot modify the agent.

command

Displays the command that the system uses to obtain the metrics from the resource. See the documentation for this resource for information on available commands. You cannot modify the command.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `real_server`.

description

User defined description.

`glob` Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`name` Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

method

Displays the GET method. You cannot modify the method.

metrics

Specifies the performance metrics that the commands collect from the target. The default value is `ServerBandwidth:1.5, CPUPercentUsage, MemoryUsage, TotalClientCount`.

partition

Displays the administrative partition within which the component resides.

probe-timeout

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

gtm monitor scripted

NAME

scripted - Configures a Scripted monitor.

MODULE

gtm monitor

SYNTAX

Configure the scripted component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create scripted [name]
modify scripted [name]
options:
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  filename [ [filename] | none]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-timeout [integer]
  timeout [integer]
```

```
edit scripted [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list scripted
list scripted [ [name] | [glob] | [regex] ] ... ]
show running-config scripted
show running-config scripted [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete scripted [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the scripted component to configure a custom monitor, or you can use the default scripted monitor that the Global Traffic Manager provides.

EXAMPLES

```
create scripted my_scripted defaults-from scripted
```

Creates a monitor named my_scripted that inherits properties from the default Scripted monitor.

```
list scripted
```

Displays the properties of all of the scripted monitors.

OPTIONS

debug
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is scripted.

description User defined description.

destination Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

filename Specifies the name of a file in the /config/eav/ directory on the system. The user-created file contains the send and expect data that the monitor uses for the monitor check. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition Displays the administrative partition within which the component resides.

probe-timeout Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

gtm monitor sip

NAME
sip - Configures a Session Initiation Protocol (SIP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the sip component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create sip [name]
modify sip [name]
options:
  cert [ [cert list] | none]
  cipherlist [list]
  compatibility [enabled | disabled]
  debug [ no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  filter [any | none | status]
  filter-neg [any | none | status]
  headers [ [new line separated headers] | none]
  ignore-down-response [enabled | disabled]
  interval [integer]
  key [ [key] | none]
  mode [sips | tcp | tls | udp]
  probe-timeout [integer]
  request [none | [string] ]
  username [ [name] | none]
```

```
edit sip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list sip
list sip [ [ [name] | [glob] | [regex] ] ... ]
show running-config sip
show running-config sip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete sip [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the sip component to configure a custom monitor, or you can use the default SIP monitor that the Global Traffic Manager provides. This type of monitor checks the status of SIP Call-ID services on a device. The SIP protocol enables real-time messaging, voice, data, and video.

EXAMPLES

```
create sip my_sip defaults-from sip
```

Creates a monitor named my_sip that inherits properties from the default SIP monitor.

```
list sip
```

Displays the properties of all of the SIP monitors.

OPTIONS

cert Specifies a fully-qualified path for a client certificate that the monitor sends to the target SSL server. The default value is none.

cipherlist
Specifies the list of ciphers for this monitor. The default value is none.

compatibility
Specifies, when enabled, that the SSL options setting (in OpenSSL) is set to ALL. The default value is enabled.

debug
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from
Specifies the name of the monitor from which you want your custom

monitor to inherit settings. The default value is sip.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

filter
Specifies the SIP status codes that the target can return to be considered up. By default the system always accepts status codes whose value is in the 100s, 200s, or 300s.

The options are:

any Specifies that the monitor accepts any SIP status codes.

none Specifies that the monitor does not accept any other SIP status codes. This is the default value.

status
Specifies one or more status codes that you want to add to the monitor.

filter-neg
Specifies the SIP status codes that the target can return to be considered down. By default the system always accepts status codes according to sip-monitor.filter. After checking that, the status code is checked against this key. If a code is also in sip-monitor.filter, the node is marked up.

The options are:

any Specifies that the monitor rejects all SIP status codes that are not in sip-monitor.filter.

none Specifies that the monitor does not specifically reject any other SIP status codes. This is the default value.

status
Specifies one or more status codes that you want to add to the monitor.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

headers
Specifies the set of SIP headers in the SIP message that is sent to the target. Separate each header with a new line. The default value is none.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

key Specifies the key if the monitored target requires authentication. The default value is none.

mode Specifies the protocol that the monitor uses to communicate with the target. The options are:

sips Specifies that the monitor uses SIPS to communicate with the target.

tcp Specifies that the monitor uses TCP to communicate with the target.

tls Specifies that the monitor uses TLS to communicate with the target, and the SIP URI is SIPS.

udp Specifies that the monitor uses UDP to communicate with the target.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

request
Specifies the SIP request line in the SIP message that is sent to the target. The default value is none.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

gtm monitor smtp

NAME
smtp - Configures a Simple Mail Transport Protocol (SMTP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the smtp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create smtp [name]
modify smtp [name]
options:
 debug [no | yes]
 defaults-from {name}
 description [string]
 destination [[ipv4 address[:port]] | [ipv6 address[.port]]]
 domain [[name] | none]
 ignore-down-response [enabled | disabled]
 interval [integer]
 probe-timeout [integer]
 timeout [integer]

edit smtp [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list smtp
list smtp [[[name] | [glob] | [regex]] ...]
show running-config smtp
show running-config smtp [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete smtp [name]

Note: You cannot delete default monitors.

DESCRIPTION

You can use the smtp component to configure a custom monitor, or you can use the default SMTP monitor that the Global Traffic Manager provides. This type of monitor checks the status of a pool, pool member, or virtual server by issuing standard SMTP commands.

EXAMPLES

create smtp my_smtp defaults-from smtp

Creates a monitor named `my_smtp` that inherits properties from the default SMTP monitor.

`list smtp`

Displays the properties of all of the SMTP monitors.

OPTIONS

`debug`

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is `no`.

The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

`defaults-from`

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `smtp`.

`description`

User defined description.

`destination`

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

`*:port`

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`domain`

Specifies the domain name to check, for example, `bigipinternal.com`. The default value is `none`.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`ignore-down-response`

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is `disabled`.

`interval`

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`probe-timeout`

Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`timeout`

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

SEE ALSO

gtm monitor snmp-link

NAME
snmp-link - Configures a Simple Network Management Protocol (SNMP) link monitor.

MODULE
gtm monitor

SYNTAX
Configure the snmp-link component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create snmp-link [name]
modify snmp-link [name]
options:
  app-service [[string] | none]
  community [[name] | none]
  defaults-from [name]
  description [string]
  destination [ip address]
  ignore-down-response [enabled | disabled]
  interval [integer]
  port [ [integer] | none]
  probe-attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  timeout [integer]
  version [ [integer] | none]
```

```
edit snmp-link [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list snmp-link
list snmp-link [ [ [name] | [glob] | [regex] ] ... ]
show running-config snmp-link
show running-config snmp-link [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete snmp-link [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the snmp-link component to configure a custom monitor, or you can use the default SNMP Link monitor that the Global Traffic Manager provides. This type of monitor checks the current CPU, memory, and disk usage of a pool, pool member, or virtual server that is running an SNMP data collection agent, and then dynamically load balances traffic accordingly.

EXAMPLES

```
create snmp-link my_snmp-link defaults-from snmp_link
```

Creates a monitor named my_snmp-link that inherits properties from the default SNMP Link monitor.

```
list snmp-link
```

Displays the properties of all of the SNMP Link monitors.

OPTIONS

app-service
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

community
Specifies the community name that the BIG-IP(r) system must use to authenticate with the host server through SNMP. The default value is public.

defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is snmp_link.

description
User defined description.

destination
Specifies the IP address of the resource that is the destination of this monitor. The default value is *.

Possible values are:

* Specifies to perform a health check on the IP address of the node.

IP address
Specifies to perform a health check on the IP address that you specify, route the check through the IP address of the associated node, and mark the IP address of the associated node up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

port Specifies the port number to which this monitor sends SNMP traps. The default value is 161.

probe-attempts
Specifies the number of times the BIG-IP system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 3.

probe-interval
Specifies the frequency at which the BIG-IP system probes the host server. The default value is 0.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 30 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

version
Specifies the SNMP version the monitor uses. The default value is none.

BIG-IP 2012-10-19 gtm monitor snmp-link(1)

gtm monitor snmp

NAME

snmp - Configures a Simple Network Management Protocol (SNMP) monitor.

MODULE

gtm monitor

SYNTAX

Configure the snmp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create snmp [name]
modify snmp [name]
options:
  app-service [[string] | none]
  community [ [name] | none]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  port [integer]
  probe attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  timeout [integer]
  version [ [integer] | none]
```

```
edit snmp [ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list snmp
list snmp [ [ [name] | [glob] | [regex] ] ... ]
show running-config snmp
show running-config snmp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete snmp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the snmp component to configure a custom monitor, or you can use the default SNMP monitor that the Global Traffic Manager provides. The SNMP monitor is both a health and performance monitor. This type of monitor checks the performance of a server running an SNMP agent such as UC Davis, for the purpose of load balancing traffic to that server.

EXAMPLES

```
create snmp my_snmp defaults-from snmp_gtm
```

Creates a monitor named my_snmp that inherits properties from the default SNMP monitor.

```
list snmp
```

Displays the properties of all of the SNMP monitors.

OPTIONS

app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

community

Specifies the community name that the BIG-IP(r) system must use to authenticate with the host server through SNMP. The default value is public.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is snmp_gtm.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 90 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

port Specifies the port number to which this monitor sends SNMP traps. The default value is 161.

probe-attempts
Specifies the number of times the BIG-IP system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 1.

probe-interval
Specifies the frequency at which the BIG-IP system probes the host server. The default value is 1.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 180 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

version
Specifies the SNMP version the monitor uses. The default value is v1.

gtm monitor soap

NAME
soap - Configures a Simple Object Access Protocol (SOAP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the soap component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create soap [name]
modify soap [name]
options:
 debug [no | yes]
 defaults-from [name]
 description [string]
 destination [[ipv4 address[:port]] | [ipv6 address[:port]]]
 expect-fault [no | yes]
 ignore-down-response [enabled | disabled]
 interval [integer]

```

method [string]
namespace [ [name] | none]
parameter-name [ [name] | none]
parameter-type [bool | int | long | [string] ]
parameter-value [none | [integer] | [string] ]
password [none | [password] ]
probe-timeout [integer]
protocol [[none] | [protocol] ]
return-type [bool | char | double | int | long | short | [string] ]
return-value [none | [integer] | [string] ]
soap-action [string]
timeout [integer]
url-path [none | [string] ]
username [ [name] | none]

```

```
edit soap [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```

all-properties
non-default-properties

```

DISPLAY

```
list soap
```

```
list soap [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config soap
```

```
show running-config soap [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```

all-properties
non-default-properties
one-line
partition

```

DELETE

```
delete soap [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the soap component to configure a custom monitor, or you can use the default SOAP monitor that the Global Traffic Manager provides. This type of monitor tests a Web service based on SOAP.

EXAMPLES

```
create soap my_soap defaults-from soap
```

Creates a monitor named `my_soap` that inherits values from the system default SOAP monitor.

```
list soap
```

Displays the properties of all of the SOAP monitors.

OPTIONS

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

defaults-from

Specifies the type of monitor you want to use to create the new monitor. The default value is soap.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

expect-fault

Specifies whether the value of the method option causes the monitor to expect a SOAP fault message. The default value is no.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

method
Specifies the method by which the monitor contacts the resource.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

namespace
Specifies the name space for the Web service you are monitoring, for example, http://example.com/. The default value is none.

parameter-name
If the method has a parameter, specifies the name of that parameter. The default value is bool.

parameter-type
Specifies the parameter type. The default value is none.

parameter-value
Specifies the value for the parameter. The default value is none.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

protocol
Specifies the protocol that the monitor uses to communicate with the target. The default value is none.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

return-type
Specifies the type for the returned parameter. The default value is bool.

return-value
Specifies the value for the returned parameter. The default value is none.

soap-action
Specifies the value for the SOAPAction header. The default value is the empty string.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds. If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

url-path
Specifies the URL for the Web service that you are monitoring, for example, /services/mysevice.aspx. The default value is none.

username
Specifies the user name if the monitored target requires authentication. The default value is none.

gtm monitor tcp-half-open

NAME

tcp-half-open - Configures a Transmission Control Protocol (TCP) Half

Open monitor.

MODULE
gtm monitor

SYNTAX
Configure the tcp-half-open component within the gtm monitor module using the syntax in the following sections.

```
CREATE/MODIFY
create tcp-half-open [name]
modify tcp-half-open [name]
options:
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  timeout [integer]
  transparent [disabled | enabled]

edit tcp-half-open [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list tcp-half-open
list tcp-half-open [ [ name ] | [ glob ] | [ regex ] ] ... ]
show running-config tcp-half-open
show running-config tcp-half-open [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete tcp-half-open [name]
```

Note: You cannot delete default monitors.

DESCRIPTION
You can use the tcp-half-open component to configure a custom monitor, or you can use the default TCP Half Open monitor that the Global Traffic Manager provides.

For more information about configuring monitors, refer to the Configuration Guide for BIG-IP(r) Global Traffic Management.

EXAMPLES
create tcp-half-open my_tcp-half-open defaults-from tcp_half_open

Creates a monitor named my_tcp-half-open that inherits properties from the default TCP Half Open monitor.

list tcp-half-open

Displays the properties of all of the TCP Half Open monitors.

OPTIONS
defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is tcp_half_open.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

IP address:port (with the transparent option enabled)
Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor

check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

probe-attempts
Specifies the number of times the BIG-IP system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 3.

probe-interval
Specifies the frequency at which the BIG-IP system probes the host server. The default value is 1.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent
Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

BIG-IP 2017-08-15 gtm monitor tcp-half-open(1)

gtm monitor tcp

NAME
tcp - Configures a Transmission Control Protocol (TCP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the tcp component within the gtm monitor module using the syntax in the following sections.

```
CREATE/MODIFY
create tcp [name]
modify tcp [name]
options:
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-timeout [integer]
  recv [none | [string] ]
  reverse [enabled | disabled]
  send [none | [string] ]
  timeout [integer]
  transparent [disabled | enabled]

edit tcp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list tcp
list tcp [ [ [name] | [glob] | [regex] ] ... ]
show running-config tcp
show running-config tcp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete tcp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the tcp component to configure a custom monitor, or you can use the default TCP monitor that the Global Traffic Manager provides.

EXAMPLES

```
create tcp my_tcp defaults-from tcp
```

Creates a monitor named my_tcp that inherits properties from the default TCP monitor.

```
list tcp
```

Displays the properties of all of the TCP monitors.

OPTIONS

defaults-from
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is tcp.

description
User defined description.

destination
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

. Specifies to perform a health check on the IP address and port supplied by a pool member.

***:port**
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

IP address:port (with the transparent option enabled)
Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

reverse
Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored

object down instead of up. You can use the this mode only if you configure both the send and recv options.

The default value is disabled, which specifies that the monitor does not operate in reverse mode. The enabled value specifies that the monitor operates in reverse mode.

send Specifies the text string that the monitor sends to the target object. The default setting is GET /, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

BIG-IP 2017-08-15 gtm monitor tcp(1)

gtm monitor udp

NAME

udp - Configures a User Datagram Protocol (UDP) monitor.

MODULE

gtm monitor

SYNTAX

Configure the udp component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create udp [name]
modify udp [name]
options:
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ [ ipv4 address[:port] ] | [ ipv6 address[.port] ] ]
  ignore-down-response [enabled | disabled]
  interval [integer]
  probe-attempts [integer]
  probe-interval [integer]
  probe-timeout [integer]
  recv [none | [string] ]
  reverse [enabled | disabled]
  send [none | [string] ]
  timeout [integer]
  transparent [disabled | enabled]
```

```
edit udp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list udp
list udp [ [ [name] | [glob] | [regex] ] ... ]
show running-config udp
```

```
show running-config udp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete udp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the `udp` component to configure a custom monitor, or you can use the default UDP monitor that the Global Traffic Manager provides. This type of monitor verifies the UDP service by attempting to send UDP packets to a pool, pool member, or virtual server, and receiving a reply.

For more information about configuring monitors, refer to the Configuration Guide for BIG-IP(r) Global Traffic Management.

EXAMPLES

```
create udp my_udp defaults-from udp
```

Creates a monitor named `my_udp` that inherits properties from the default UDP monitor.

```
list udp
```

Displays the properties of all of the UDP monitors.

OPTIONS

`debug`

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is `no`.

The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

`defaults-from`

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `udp`.

`description`

User defined description.

`destination`

Specifies the IP address and service port of the resource that is the destination of this monitor. Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

`*:port`

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

`IP address:port`

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`IP address:port (with the transparent option enabled)`

Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`ignore-down-response`

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

`interval`

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`probe-attempts`

Specifies the number of times the BIG-IP system attempts to probe the host server, after which the BIG-IP system considers the host server down or unavailable. The default value is 3.

`probe-interval`

Specifies the frequency at which the BIG-IP system probes the host server. The default value is 1.

probe-timeout
Specifies the number of seconds after which the BIG-IP system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

reverse
Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored object down instead of up.

The default value is disabled, which specifies that the monitor does not operate in reverse mode. The enabled value specifies that the monitor operates in reverse mode.

send Specifies the text string that the monitor sends to the target object. The default value is "default send string".

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the value of the recv option and ignores the option even if not null.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds. If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent
Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

BIG-IP 2017-08-15 gtm monitor udp(1)

gtm monitor wap

NAME
wap - Configures a Wireless Application Protocol (WAP) monitor.

MODULE
gtm monitor

SYNTAX
Configure the wap component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY
create wap [name]
modify wap [name]
options:
accounting-node [none | [RADIUS server name]]
accounting-port [[integer] | none]
call-id [none | [RADIUS server 11 digit phone number]]

```
check-until-up [enabled | disabled]
debug [no | yes]
defaults-from [name]
description [string]
destination [ [ ipv4 address[:port] ] | [ ipv6 address[:port] ] ]
framed-address [none | [RADIUS framed IP address] ]
ignore-down-response [enabled | disabled]
interval [integer]
probe-timeout [integer]
recv [none | [string] ]
secret [none | [password] ]
send [none | [string] ]
server-id [none | [RADIUS NAS-ID] ]
session-id [none | [RADIUS session ID] ]
timeout [integer]
```

```
edit wap [ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
```

```
all-properties
non-default-properties
```

```
DISPLAY
```

```
list wap
```

```
list wap[ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config wap
```

```
show running-config wap[ [ [name] | [glob] | [regex] ] ... ]
```

```
options:
```

```
all-properties
non-default-properties
one-line
partition
```

```
DELETE
```

```
delete wap [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the wap component to configure a custom monitor, or you can use the default WAP monitor that the Global Traffic Manager provides. This type of monitor requests the URL specified in the send option, and finds the string specified in the recv option somewhere in the data returned by the URL response.

EXAMPLES

```
create wap my_wap defaults-from wap
```

Creates a monitor named my_wap that inherits properties from the default WAP monitor.

```
list wap
```

Displays the properties of all of the WAP monitors.

OPTIONS

accounting-node

Specifies the RADIUS server that provides authentication for the WAP target. Note that if you configure the accounting-port option, but you do not configure the this option, the system assumes that the RADIUS server and the WAP server are the same system.

accounting-port

Specifies the port that the monitor uses for RADIUS accounting. The default value is none. A value of 0 (zero) disables RADIUS accounting.

call-id

Specifies the 11-digit phone number for the RADIUS server. The default value is none.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is wap.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is *.*.

Possible values are:

: Specifies to perform a health check on the IP address and port supplied by a pool member.

*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

framed-address
Specifies the RADIUS framed IP address. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response
Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval
Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

recv Specifies the text string that the monitor looks for in the returned resource. The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names. If you do not specify both a value for both the send and recv options, the monitor performs a simple service check and connect only. The default value is none.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret
Specifies the password the monitor needs to communicate with the resource. The default value is none.

send Specifies the text string that the monitor sends to the target object. The default setting is GET /, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if it is not null. The default value is none.

server-id
Specifies the RADIUS NAS-ID for this system when configuring a RADIUS server. The default value is none.

session-id
Specifies the RADIUS session identification number when configuring a RADIUS server. The default value is none.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

gtm monitor wmi

NAME
wmi - Configures a Windows(r) Management Instrumentation (WMI) monitor.

MODULE
gtm monitor

SYNTAX
Configure the wmi component within the gtm monitor module using the syntax in the following sections.

CREATE/MODIFY

create wmi [name]

modify wmi [name]

options:

command [[command] | none]

defaults-from [name]

description [string]

ignore-down-response [enabled | disabled]

interval [integer]

metrics [[integer] | none]

password [none | [password]]

probe-timeout [integer]

timeout [integer]

url [none | [URL]]

username [[name] | none]

edit wmi [[[name] | [glob] | [regex]] ...]

options:

all-properties

non-default-properties

DISPLAY

list wmi

list wmi [[[name] | [glob] | [regex]] ...]

show running-config wmi

show running-config wmi [[[name] | [glob] | [regex]] ...]

options:

agent

all-properties

method

non-default-properties

one-line

partition

post

DELETE

delete wmi [name]

Note: You cannot delete default monitors.

DESCRIPTION

You can use the wmi component to configure a custom monitor, or you can use the default WMI monitor that the Global Traffic Manager provides. This type of monitor checks the performance of a pool, pool member, or virtual server that is running the WMI data collection agent, and then dynamically load balances traffic accordingly.

EXAMPLES

```
create wmi my_wmi defaults-from wmi
```

Creates a monitor named my_wmi that inherits properties from the default WMI monitor.

```
list wmi
```

Displays the properties of all of the WMI monitors.

OPTIONS

agent

Displays the agent for the monitor. The default agent is Mozilla/4.0 (compatible: MSIE 5.0; Windows NT). You cannot modify the agent.

command

Specifies the command that the system uses to obtain the metrics from the resource. See the documentation for this resource for information on available commands.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is wmi.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-down-response

Specifies whether the monitor ignores a down response from the system it is monitoring. The default value is disabled.

interval

Specifies the frequency at which the system issues the monitor check. The default value is 30 seconds.

method
Displays the GET method. You cannot modify the method.

metrics
Specifies the performance metrics that the commands collect from the target. The default value is LoadPercentage, DiskUsage, PhysicalMemoryUsage:1.5, VirtualMemoryUsage:2.0.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

password
Specifies the password if the monitored target requires authentication. The default value is none.

post Specifies the mechanism that the monitor uses for posting. The default value is RespFormat=HTML. You cannot change the post format for WMI monitors.

probe-timeout
Specifies the number of seconds after which the BIG-IP(r) system times out the probe request to the BIG-IP system. The default value is 5 seconds.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 120 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

url Specifies the URL that the monitor uses. The default value is /scripts/f5Isapi.dll.

username
Specifies the user name if the monitored target requires authentication. The default value is none.

gtm path

NAME
path - Displays path statistics for the Global Traffic Manager(tm).

MODULE
gtm

SYNTAX
Show the path statistics using the syntax in the following section.

DISPLAY
show path
options:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt

DESCRIPTION
You can use the path component to display path statistics for the Global Traffic Manager.

SEE ALSO
show, tmsh

BIG-IP 2017-04-05 gtm path(1)

gtm persist

NAME

persist - Displays persistence records for the Global Traffic Manager(tm).

MODULE

gtm

SYNTAX

Display statistics for the persist component within the gtm module using the syntax in the following section.

DISPLAY

show persist

options:

destination [[name] | none]
key [ip address | string]
level [application | wideip]
max-results [integer]
target-name [[name] | none]
target-type [datacenter | link | pool-member | server]

DESCRIPTION

You can use the persist component to display various persistence records based on the filtering options that you use.

EXAMPLES

show persist

Displays all Global Traffic Manager persistence records.

show persist level wideip

Displays persistence records only for wideip persistence.

OPTIONS

destination

Displays persistence records for the specified destination.

key Displays persistence records for the specified LDNS address or generic key.

level

Displays persistence records for the specified level (destination type), either wideip or application.

max-results

Specifies the maximum number of persistence records that you want the system to return.

target-name

Displays persistence records for the specified target name.

If target-type pool-member is specified, then a valid target-name filter for a terminal pool member is the full path virtual server name, for example /Common/vs-dns-1. Do not include the server name in the target-name filter field.

For a non-terminal member the valid target-name filter is the non-pathed DNS name, for example www.alt.example.com.

Please refer to the EXAMPLES section below for more info.

target-type

Displays persistence records for the specified type of target.

EXAMPLES

All persistence records:

```
[root@bigip-1:Active:Standalone] config # tms show gtm persist
Value      Level:Destination -> Target      Expiration
10.2.4.4    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com  11-03 17:23:54
10.2.4.1    wideip:A:/Common/www.example.com -> pool-member:/Common/gtm-server-1:/Common/vs-dns-1 11-03 17:23:5
10.2.4.3    wideip:A:/Common/www.example.com -> pool-member:/Common/gtm-server-1:/Common/vs-dns-2 11-03 17:
10.2.4.5    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com  11-03 17:23:54
10.2.4.2    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com  11-03 17:23:54
Total persistence records returned: 5
```

Filter: show only records for pool member /Common/vs-dns-2

```
[root@bigip-1:Active:Standalone] config # tms show gtm persist target-type pool-member target-name /Common/vs-dn
Value      Level:Destination -> Target      Expiration
```

```
10.2.4.2      wideip:A:/Common/www.example.com -> pool-member:/Common/gtm-server-1:/Common/vs-dns-2      11-03 16:
Total persistence records returned: 1
```

Notice that only the virtual server name /Common/vs-dns-2 is specified in the target-name filter.

```
Filter: show only records for pool member CNAME www.alt.example.com
[root@bigip-1:Active:Standalone] config # tmsh show gtm persist target-type pool-member target-name www.alt.examp
Value      Level:Destination -> Target      Expiration
10.2.4.4    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com      11-03 17:23:54
10.2.4.5    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com      11-03 17:23:54
10.2.4.2    wideip:A:/Common/www.example.com -> pool-member:www.alt.example.com      11-03 17:23:54
Total persistence records returned: 3
```

DELETE
delete pool a [name]

    Note: You must remove all references to a pool before you can delete
    the pool.

DESCRIPTION
    You can use the pool component to configure the A pool definitions on
    the Global Traffic Manager. You use a pool to group member servers
    together to use a common load balancing algorithm.

EXAMPLES
    create pool a mypool members add {
member myServer:myVs
    }
monitor http

    Creates a Global Traffic Manager A pool with one member myServer:myVs
    using the Round Robin load balancing method, and default HTTP monitor
    checks for member availability.

    delete pool a my_pool

    Deletes the pool my_pool.

    show pool a

    Displays statistics for all A pools.

    list pool a my_pool

    Displays settings of pool my_pool.

OPTIONS
    alternate-mode
    Specifies the load balancing mode that the system uses to load
    balance name resolution requests among the members of this pool,
    if the preferred method is unsuccessful in picking a pool. You set
    the preferred mode using the load-balancing-mode option. The
    default value is round-robin.

    The options are:

```

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip

Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

none Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the fallback-mode option.

Note that if the value of the fallback-mode option is none, and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

app-service

Specifies the name of the application service to which this pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

description

User defined description.

[disabled | enabled]

Specifies whether this pool is available for load balancing. The default value is enabled.

dynamic-ratio

Enables or disables a dynamic ratio load balancing algorithm for this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-ip

Specifies the IPv6 address of the server to which the system directs requests in the event that the load balancing methods configured for this pool fail to return a valid virtual server. The default value is ::.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate
Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet
Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip
Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

fewest-hops
Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability
Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second
Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections
Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time
Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate
Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service
Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence
Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology
Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

limit-max-bps
Specifies the maximum allowable data throughput rate, in bits per

second, for the virtual servers in the pool. If the network traffic volume exceeds this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-bps-status
Enables or disables the `limit-max-bps` option for this pool. The default value is disabled.

limit-max-connections
Specifies the number of current connections allowed for the virtual servers in the pool. If the current connections exceed this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-connections-status
Enables or disables the `limit-max-connections` option for this pool. The default value is disabled.

limit-max-pps
Specifies the maximum allowable data transfer rate, in packets per second, for the virtual servers in the pool. If the network traffic volume exceeds this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-pps-status
Enables or disables the `limit-max-pps` option for this pool. The default value is disabled.

load-balancing-mode
Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is `round-robin`.

The options are:

completion-rate
Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet
Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip
Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

fewest-hops
Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability
Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second
Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections
Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time
Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate
Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service
Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

max-answers-returned

Specifies the maximum number of available virtual servers that the system lists in a response. The default value is 1.

members

Specifies the vs-name of the pool members. The default value is none.

You can also use the following options with pool members:

app-service

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

depends-on

Specifies the name of the virtual server on which this pool member depends.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available for load balancing. The default value is enabled.

limit-max-bps

Specifies the maximum allowable data throughput rate, in bits per second, for the pool member. If the network traffic volume exceeds this value, the system marks the pool member as unavailable.

limit-max-bps-status

Enables or disables the limit-max-bps option for this pool member. The default value is disabled.

limit-max-connections

Specifies the number of current connections allowed for this pool member. If the current connections exceed this value, the system marks this pool member as unavailable.

limit-max-connections-status

Enables or disables the limit-max-connection option for this pool member. The default value is disabled.

limit-max-pps

Specifies the maximum allowable data transfer rate, in packets per second, for this pool member. If the network traffic volume exceeds this value, the system marks this pool member as unavailable.

limit-max-pps-status

Enables or disables the limit-max-pps option for this pool member. The default value is disabled.

member-order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

monitor

Specifies the health monitors that the system uses to determine whether it can use this pool member for load balancing. Multiple monitors may be specified with the and keyword. The min keyword is used to specify the minimum number of monitors that must succeed for this pool member to be declared up. The require keyword is used to specify the minimum number of probes that must succeed for this server to

be declared up and the number of probers that should be used.
The default value is none.

ratio
Specifies the weight of the pool member for load balancing purposes.

vs-name
Displays the name of the corresponding virtual server.

metadata
Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

monitor
Specifies the health monitors that the system uses to determine whether it can use this pool for load balancing. Multiple monitors may be specified with the **and** keyword. The **min** keyword is used to specify the minimum number of monitors that must succeed for this pool to be declared up. The **require** keyword is used to specify the minimum number of probes that must succeed for this server to be declared up and the number of probers that should be used. The default value is none.

name Specifies a unique name for the component. This option is required for the commands **create** and **modify**.

partition
Displays the partition within which the component resides.

qos-hit-ratio
Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops
Assigns a weight to the Hops performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 0 (zero).

qos-kilobytes-second
Assigns a weight to the Kilobytes per Second performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 3.

qos-lcs
Assigns a weight to the Link Capacity performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 30.

qos-packet-rate
Assigns a weight to the Packet Rate performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 1.

qos-rtt
Assigns a weight to the Round Trip Time performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 50.

qos-topology
Assigns a weight to the Topology performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 0 (zero).

qos-vs-capacity
Assigns a weight to the Virtual Server performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 0 (zero).

qos-vs-score
Assigns a weight to the Virtual Server Score performance factor when the value of the either the **load-balancing-mode** or **fallback-mode** options is **quality-of-service**. The default value is 0 (zero).

regex
Displays the items that match the regular expression. The regular expression must be preceded by an **@** sign (**@[regular expression]**) to indicate that the identifier is a regular expression. See **help regex** for a description of regular expression syntax.

t1 Specifies the number of seconds that the IP address, once found, is valid. Once the time-to-live (TTL) expires, the client has to request the IP address resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability
Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

BIG-IP 2016-06-09 gtm pool a(1)

gtm pool aaaa

NAME
aaaa - Configures AAAA load balancing pools for the Global Traffic Manager(tm).

MODULE
gtm pool

SYNTAX
Modify the Global Traffic Manager pool aaaa component within the gtm module using the syntax shown in the following sections.

CREATE/MODIFY
create pool aaaa [name]
modify pool aaaa [name]
options:

DELETE
delete pool aaaa [name]

```

Note: You must remove all references to a pool before you can delete the pool.

DESCRIPTION

You can use the pool component to configure the AAAA pool definitions on the Global Traffic Manager. You use a pool to group member servers together to use a common load balancing algorithm.

EXAMPLES

```

create pool aaaa mypool members add {
  member myServer:myVs
}
monitor http

```

Creates a Global Traffic Manager AAAA pool with one member myServer:myVs using the Round Robin load balancing method, and default HTTP monitor checks for member availability.

```
delete pool aaaa my_pool
```

Deletes the pool my_pool.

```
show pool aaaa
```

Displays statistics for all AAAA pools.

```
list pool aaaa my_pool
```

Displays settings of pool my_pool.

OPTIONS

alternate-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred method is unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option. The default value is round-robin.

The options are:

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip

Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

none Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the fallback-mode option.

Note that if the value of the fallback-mode option is none, and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

app-service

Specifies the name of the application service to which this pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

description

User defined description.

[disabled | enabled]

Specifies whether this pool is available for load balancing. The default value is enabled.

dynamic-ratio

Enables or disables a dynamic ratio load balancing algorithm for this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-ip

Specifies the IPv6 address of the server to which the system directs requests in the event that the load balancing methods configured for this pool fail to return a valid virtual server. The default value is ::.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip

Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

limit-max-bps

Specifies the maximum allowable data throughput rate, in bits per second, for the virtual servers in the pool. If the network traffic volume exceeds this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-bps-status

Enables or disables the limit-max-bps option for this pool. The default value is disabled.

limit-max-connections

Specifies the number of current connections allowed for the virtual servers in the pool. If the current connections exceed this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-connections-status

Enables or disables the limit-max-connections option for this pool. The default value is disabled.

limit-max-pps

Specifies the maximum allowable data transfer rate, in packets per second, for the virtual servers in the pool. If the network traffic volume exceeds this value, the system marks the pool as unavailable. The default value is 0 (zero).

limit-max-pps-status

Enables or disables the limit-max-pps option for this pool. The default value is disabled.

load-balancing-mode

Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fallback-ip

Specifies that the Global Traffic Manager returns the IP address that you specify as an answer to the query.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If

you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

`max-answers-returned`

Specifies the maximum number of available virtual servers that the system lists in a response. The default value is 1.

`members`

Specifies the vs-name of the pool members. The default value is none.

You can also use the following options with pool members:

`app-service`

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

`depends-on`

Specifies the name of the virtual server on which this pool member depends.

`description`

User defined description.

`[enabled | disabled]`

Specifies whether this pool member is available for load balancing. The default value is enabled.

`limit-max-bps`

Specifies the maximum allowable data throughput rate, in bits per second, for the pool member. If the network traffic volume exceeds this value, the system marks the pool member as unavailable.

`limit-max-bps-status`

Enables or disables the limit-max-bps option for this pool member. The default value is disabled.

`limit-max-connections`

Specifies the number of current connections allowed for this pool member. If the current connections exceed this value, the system marks this pool member as unavailable.

`limit-max-connections-status`

Enables or disables the limit-max-connection option for this pool member. The default value is disabled.

`limit-max-pps`

Specifies the maximum allowable data transfer rate, in packets per second, for this pool member. If the network traffic volume exceeds this value, the system marks this pool member as unavailable.

`limit-max-pps-status`

Enables or disables the limit-max-pps option for this pool member. The default value is disabled.

`member-order`

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

`monitor`

Specifies the health monitors that the system uses to determine whether it can use this pool member for load balancing. Multiple monitors may be specified with the and keyword. The min keyword is used to specify the minimum number of monitors that must succeed for this pool member to be declared up. The require keyword is used to specify the minimum number of probes that must succeed for this server to be declared up and the number of probers that should be used. The default value is none.

`ratio`

Specifies the weight of the pool member for load balancing purposes.

`vs-name`

Displays the name of the corresponding virtual server.

`metadata`

Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

`monitor`

Specifies the health monitors that the system uses to determine whether it can use this pool for load balancing. Multiple monitors may be specified with the and keyword. The min keyword is used to specify the minimum number of monitors that must succeed for this pool to be declared up. The require keyword is used to specify the minimum number of probes that must succeed for this server to be declared up and the number of probers that should be used. The default value is none.

name Specifies a unique name for the component. This option is required for the commands `create` and `modify`.

partition
Displays the partition within which the component resides.

qos-hit-ratio
Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops
Assigns a weight to the Hops performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 0 (zero).

qos-kilobytes-second
Assigns a weight to the Kilobytes per Second performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 3.

qos-lcs
Assigns a weight to the Link Capacity performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 30.

qos-packet-rate
Assigns a weight to the Packet Rate performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 1.

qos-rtt
Assigns a weight to the Round Trip Time performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 50.

qos-topology
Assigns a weight to the Topology performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 0 (zero).

qos-vs-capacity
Assigns a weight to the Virtual Server performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 0 (zero).

qos-vs-score
Assigns a weight to the Virtual Server Score performance factor when the value of the either the `load-balancing-mode` or `fallback-mode` options is `quality-of-service`. The default value is 0 (zero).

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

t1 Specifies the number of seconds that the IP address, once found, is valid. Once the time-to-live (TTL) expires, the client has to request the IP address resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability
Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

BIG-IP 2016-06-10 gtm pool aaaa(1)

gtm pool cname

NAME
`cname` - Configures CNAME load balancing pools for the Global Traffic Manager(tm).

MODULE
`gtm pool`

SYNTAX

Modify the Global Traffic Manager pool cname component within the gtm module using the syntax shown in the following sections.

CREATE/MODIFY

```
create pool cname [name]
modify pool cname [name]
options:
  alternate-mode [drop-packet | global-availability
    | none | packet-rate | ratio | return-to-dns | round-robin
    | static-persistence | topology | virtual-server-capacity
    | virtual-server-score]
  app-service [[string] | none]
  description [string]
  [disabled | enabled]
  dynamic ratio [disabled | enabled]
  fallback-mode [completion-rate | cpu | drop-packet
    | fewest-hops | global-availability | kilobytes-per-second

  detail
  field-fmt
```

DELETE

```
delete pool cname [name]
```

Note: You must remove all references to a pool before you can delete the pool.

DESCRIPTION

You can use the pool component to configure the CNAME pool definitions on the Global Traffic Manager. You use a pool to group member names together to use a common load balancing algorithm.

EXAMPLES

```
create pool cname mypool members add {
```

```
canonical.mydomain.com
}

Creates a Global Traffic Manager CNAME pool with one member
canonical.mydomain.com using the Round Robin load balancing method.

delete pool cname my_pool

Deletes the pool my_pool.

show pool cname

Displays statistics for all CNAME pools.

list pool cname my_pool

Displays settings of pool my_pool.
```

OPTIONS

alternate-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred method is unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option. The default value is round-robin.

The options are:

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

none Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the fallback-mode option.

Note that if the value of the fallback-mode option is none, and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

app-service

Specifies the name of the application service to which this pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

description

User defined description.

[disabled | enabled]

Specifies whether this pool is available for load balancing. The default value is enabled.

dynamic-ratio

Enables or disables a dynamic ratio load balancing algorithm for this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-

score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual

servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

load-balancing-mode
Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

completion-rate
Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet
Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops
Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability
Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second
Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections
Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time
Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate
Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service
Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence
Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology
Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection

requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

members

Specifies the member-dname of the pool members. The default value is none.

You can also use the following options with pool members:

app-service

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available for load balancing. The default value is enabled.

member-order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

ratio

Specifies the weight of the pool member for load balancing purposes.

static-target

Specifies the member's name specifies a static DNAME rather than a name linked to a Wide IP defined on the system. This may be required if the target DNAME is not owned by the organization or configured on GTM. One side-effect of using a static target is that the member is always considered available for load balancing. The default value is no.

member-dname

Displays the member's DNAME.

metadata

Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the partition within which the component resides.

qos-hit-ratio

Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops

Assigns a weight to the Hops performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-kilobytes-second

Assigns a weight to the Kilobytes per Second performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 3.

qos-lcs

Assigns a weight to the Link Capacity performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 30.

qos-packet-rate

Assigns a weight to the Packet Rate performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 1.

qos-rtt

Assigns a weight to the Round Trip Time performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 50.

qos-topology

Assigns a weight to the Topology performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-capacity

Assigns a weight to the Virtual Server performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-score
Assigns a weight to the Virtual Server Score performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

t11 Specifies the number of seconds that the answer, once found, is valid. Once the time-to-live (TTL) expires, the client has to request name resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability
Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

```

Note: You must remove all references to a pool before you can delete the pool.

DESCRIPTION

You can use the pool component to configure the MX pool definitions on the Global Traffic Manager. You use a pool to group member names together to use a common load balancing algorithm.

EXAMPLES

```

create pool mx mypool members add {
    mail1.mydomain.com {
priority 20
    }
}

```

Creates a Global Traffic Manager MX pool with one member mail1.mydomain.com with priority 20 using the Round Robin load balancing method.

```
delete pool mx my_pool
```

Deletes the pool my_pool.

```
show pool mx
```

Displays statistics for all MX pools.

```
list pool mx my_pool
```

Displays settings of pool my_pool.

OPTIONS

alternate-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred method is unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option. The default value is round-robin.

The options are:

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

none Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the fallback-mode option.

Note that if the value of the fallback-mode option is none,

and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

app-service

Specifies the name of the application service to which this pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

description

User defined description.

[disabled | enabled]

Specifies whether this pool is available for load balancing. The default value is enabled.

dynamic-ratio

Enables or disables a dynamic ratio load balancing algorithm for this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

load-balancing-mode

Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

max-answers-returned

Specifies the maximum number of available virtual servers that the system lists in a response. The default value is 1.

members

Specifies the member-dname of the pool members. The default value is none.

You can also use the following options with pool members:

app-service

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available for load balancing. The default value is enabled.

member-order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

priority

Specifies the response resource record's priority RDATA field value when this member is picked. The default value is 10.

ratio

Specifies the weight of the pool member for load balancing purposes.

member-dname

Displays the member's DNAME.

metadata

Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the partition within which the component resides.

qos-hit-ratio

Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops

Assigns a weight to the Hops performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-kilobytes-second

Assigns a weight to the Kilobytes per Second performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 3.

qos-lcs

Assigns a weight to the Link Capacity performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 30.

qos-packet-rate

Assigns a weight to the Packet Rate performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 1.

qos-rtt

Assigns a weight to the Round Trip Time performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 50.

qos-topology

Assigns a weight to the Topology performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-capacity

Assigns a weight to the Virtual Server performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-score

Assigns a weight to the Virtual Server Score performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

t1l Specifies the number of seconds that the answer, once found, is valid. Once the time-to-live (TTL) expires, the client has to request name resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability

Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

DELETE
delete pool naptr [name]

Note: You must remove all references to a pool before you can delete the pool.

DESCRIPTION

You can use the pool component to configure the NAPTR pool definitions on the Global Traffic Manager. You use a pool to group member names together to use a common load balancing algorithm.

EXAMPLES

```
create pool naptr mypool members add {
  _sip_udp.a.mydomain.com {
flags "s"
order 20
preference 100
service "sip+d2u"
}
  _sip_udp.b.mydomain.com {
flags "s"
order 20
preference 110
service "sip+d2u"
}
}
```

Creates a Global Traffic Manager NAPTR pool with two members using the Round Robin load balancing method.

```
delete pool naptr my_pool
```

Deletes the pool my_pool.

```
show pool naptr
```

Displays statistics for all NAPTR pools.

```
list pool naptr my_pool
```

Displays settings of pool my_pool.

OPTIONS

alternate-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred method is unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option. The default value is round-robin.

The options are:

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

none Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the fallback-mode option.

Note that if the value of the fallback-mode option is none, and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity

Specifies that the Global Traffic Manager assigns connection

requests to virtual servers based on a user-defined ranking system.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

app-service

Specifies the name of the application service to which this pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

description

User defined description.

[disabled | enabled]

Specifies whether this pool is available for load balancing. The default value is enabled.

dynamic-ratio

Enables or disables a dynamic ratio load balancing algorithm for this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these

scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence
Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology
Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

load-balancing-mode
Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

completion-rate
Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet
Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops
Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability
Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second
Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections
Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time
Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate
Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service
Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence
Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology
Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

max-answers-returned

Specifies the maximum number of available virtual servers that the system lists in a response. The default value is 1.

members

Specifies the member-dname of the pool members. The default value is none.

You can also use the following options with pool members:

app-service

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available for load balancing. The default value is enabled.

flags

Specifies the response resource record's flags RDATA field value when this member is picked. Either 'a' or 's' may be specified for this attribute as GTM supports only these record types.

member-order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

order

Specifies the response resource record's order RDATA field value when this member is picked. The default value is 10.

preference

Specifies the response resource record's preference RDATA field value when this member is picked. The default value is 10.

ratio

Specifies the weight of the pool member for load balancing purposes.

service

Specifies the response resource record's service RDATA field value when this member is picked.

member-dname

Displays the member's DNAME.

metadata

Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

name Specifies a unique name for the component. This option is required

for the commands create and modify.

partition
Displays the partition within which the component resides.

qos-hit-ratio
Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops
Assigns a weight to the Hops performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-kilobytes-second
Assigns a weight to the Kilobytes per Second performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 3.

qos-lcs
Assigns a weight to the Link Capacity performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 30.

qos-packet-rate
Assigns a weight to the Packet Rate performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 1.

qos-rtt
Assigns a weight to the Round Trip Time performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 50.

qos-topology
Assigns a weight to the Topology performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-capacity
Assigns a weight to the Virtual Server performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-score
Assigns a weight to the Virtual Server Score performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

ttl Specifies the number of seconds that the answer, once found, is valid. Once the time-to-live (TTL) expires, the client has to request name resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability
Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

DELETE
delete pool srv [name]
```

Note: You must remove all references to a pool before you can delete the pool.

DESCRIPTION

You can use the pool component to configure the SRV pool definitions on the Global Traffic Manager. You use a pool to group member names together to use a common load balancing algorithm.

EXAMPLES

```
    create pool srv mypool members add {
      imap.mydomain.com {
        port 143
        priority 20
      }
    }
}
```

Creates a Global Traffic Manager SRV pool with one member `imap.mydomain.com` with port 143 and priority 20 using the Round Robin load balancing method.

```
delete pool srv my_pool
```

Deletes the pool `my_pool`.

```
show pool srv
```

Displays statistics for all SRV pools.

```
list pool srv my_pool
```

Displays settings of pool `my_pool`.

OPTIONS

`alternate-mode`

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred method is unsuccessful in picking a pool. You set the preferred mode using the `load-balancing-mode` option. The default value is `round-robin`.

The options are:

`drop-packet`

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

`global-availability`

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

`none` Specifies that the system skips the alternate load balancing mode and immediately tries the load balancing mode specified in the `fallback-mode` option.

Note that if the value of the `fallback-mode` option is `none`, and you have multiple pools configured, the Global Traffic Manager uses the next available pool.

`packet-rate`

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

`ratio`

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

`return-to-dns`

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

`round-robin`

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

`static-persistence`

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

`topology`

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

`virtual-server-capacity`

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

`virtual-server-score`

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

`app-service`

Specifies the name of the application service to which this pool belongs. The default value is `none`. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete this pool. Only the application service can modify or delete this pool.

`description`

User defined description.

`[disabled | enabled]`

Specifies whether this pool is available for load balancing. The default value is `enabled`.

`dynamic-ratio`

Enables or disables a dynamic ratio load balancing algorithm for

this pool. This option is applicable only when you also configure the load-balancing-mode option for the pool with one of these dynamic load balancing modes: completion-rate, fewest-hops, kilobytes-per-second, least-connections, lowest-round-trip-times, quality-of-service, virtual-server-capacity, or virtual-server-score.

When this option is disabled (the default), the system uses only the server or virtual server with the best metrics, or highest quality of service (QoS) score, for load balancing. When dynamic-ratio is enabled, the system treats QoS scores as ratios, and it uses each server or virtual server in proportion to the ratio determined by the QoS calculation.

fallback-mode

Specifies the load balancing mode that the system uses to load balance name resolution requests among the members of this pool, if the preferred and alternate modes are unsuccessful in picking a pool. You set the preferred mode using the load-balancing-mode option, and the alternate mode using the alternate-mode option. The default value is return-to-dns.

The options are:

completion-rate

Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet

Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops

Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability

Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second

Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections

Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time

Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

none Specifies that there is no fallback mode. If the system cannot use the preferred or alternate load balancing modes, it uses the next pool to resolve the request. If there are no more pools available, the result is the same as when the value for the fallback-mode option is return-to-dns.

packet-rate

Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service

Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio

Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns

Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin

Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence

Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology

Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score
Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

load-balancing-mode
Specifies the preferred load balancing mode that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

completion-rate
Specifies that the Global Traffic Manager selects the virtual server that currently maintains the least number of dropped or timed-out packets during a transaction between a data center and the client LDNS.

cpu Specifies that the Global Traffic Manager selects the virtual server that currently has the most CPU processing time available to handle name resolution requests.

drop-packet
Specifies that the Global Traffic Manager does nothing with the packet, and simply drops the request.

fewest-hops
Specifies that the Global Traffic Manager distributes connection requests to the virtual server in the data center that has the fewest router hops from the Local DNS.

global-availability
Specifies that the Global Traffic Manager distributes connection requests to virtual servers included in the pool in the order in which they are listed.

kilobytes-per-second
Specifies that the Global Traffic Manager distributes connection requests to the virtual server that is currently processing the fewest number of kilobytes per second.

least-connections
Specifies that the Global Traffic Manager distributes connection requests to the virtual server on the Local Traffic Manager that currently hosts the fewest connections.

lowest-round-trip-time
Specifies that the Global Traffic Manager distributes connection requests to the virtual server with the fastest measured round trip time between a data center and a client LDNS.

packet-rate
Specifies that the Global Traffic Manager assigns connection requests to the virtual server that is currently processing the fewest number of packets per second.

quality-of-service
Specifies that the Global Traffic Manager distributes connection requests using current performance information to calculate an overall score for each virtual server, and then distributes connections to the virtual servers based on these scores.

ratio
Specifies that the Global Traffic Manager distributes connection requests among a pool of virtual servers using a weighted Round Robin load balancing method.

return-to-dns
Specifies that the Global Traffic Manager immediately returns connection requests to the Local DNS for resolution.

round-robin
Specifies that the Global Traffic Manager distributes connection requests in a circular and sequential pattern among the virtual servers in a pool.

static-persistence
Specifies that the Global Traffic Manager consistently maps an LDNS IP address to the same available virtual server for the duration of a session.

topology
Specifies that the Global Traffic Manager uses proximity-based load balancing to distribute connection requests.

virtual-server-capacity
Specifies that the Global Traffic Manager distributes connection requests by creating a list of the virtual servers, weighted by capacity, then picks one of the virtual servers from the list. The virtual servers with the greatest

capacity are picked most often, but over time all virtual servers are returned.

virtual-server-score

Specifies that the Global Traffic Manager assigns connection requests to virtual servers based on a user-defined ranking system.

manual-resume

Enables or disables the manual resume function for this pool. If you leave this option disabled (the default), then a member of this pool automatically becomes available for load balancing when its status changes from down to up. When the manual-resume option is enabled, if the status of a member of this pool changes from up to down, the pool member remains disabled indefinitely until you manually re-enable it.

max-answers-returned

Specifies the maximum number of available virtual servers that the system lists in a response. The default value is 1.

members

Specifies the member-dname of the pool members. The default value is none.

You can also use the following options with pool members:

app-service

Specifies the name of the application service to which this pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this pool member. Only the application service can modify or delete this pool member.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available for load balancing. The default value is enabled.

member-order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve prioritizing pool members, such as the Ratio load balancing method.

port Specifies the response resource record's port RDATA field value when this member is picked.

priority

Specifies the response resource record's priority RDATA field value when this member is picked. The default value is 10.

ratio

Specifies the relative weight of the pool member for load balancing purposes.

weight

Specifies the response resource record's weight RDATA field value when this member is picked. The default value is 10.

member-dname

Displays the member's DNAME.

metadata

Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the partition within which the component resides.

qos-hit-ratio

Assigns a weight to the Hit Ratio performance factor for the Quality of Service dynamic load balancing mode. The default value is 5.

qos-hops

Assigns a weight to the Hops performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-kilobytes-second

Assigns a weight to the Kilobytes per Second performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 3.

qos-lcs

Assigns a weight to the Link Capacity performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 30.

qos-packet-rate

Assigns a weight to the Packet Rate performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 1.

qos-rtt

Assigns a weight to the Round Trip Time performance factor when

the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 50.

qos-topology

Assigns a weight to the Topology performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-capacity

Assigns a weight to the Virtual Server performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

qos-vs-score

Assigns a weight to the Virtual Server Score performance factor when the value of the either the load-balancing-mode or fallback-mode options is quality-of-service. The default value is 0 (zero).

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

ttl Specifies the number of seconds that the answer, once found, is valid. Once the time-to-live (TTL) expires, the client has to request name resolution again. The valid values are 0 through 4294967295; the default value is 30.

verify-member-availability

Specifies that the system verifies the availability of the members before sending a connection to those resources. The default value is enabled.

BIG-IP 2016-04-28 gtm pool srv(1)

gtm prober-pool

NAME

prober-pool - Configures prober pools for the Global Traffic Manager(tm).

MODULE

gtm

SYNTAX

Modify the Global Traffic Manager prober-pool component within the gtm module using the syntax shown in the following sections.

CREATE/MODIFY

```
create prober-pool [name]
modify prober-pool [name]
options:
  app-service [[string] | none]
  description [string]
  [disabled | enabled]
  load-balancing-mode [global-availability | round-robin]
  members none
  members
    [ add | delete | modify | replace-all-with ] {
      [name] {
options:
  app-service [[string] | none]
  description [string]
  [disabled | enabled]
  order [integer]
  }...
}
```

```
edit prober-pool [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
reset-stats prober-pool
reset-stats prober-pool [ [name] | [glob] | [regex] ] ... ]
```

DISPLAY

```
list prober-pool
list prober-pool [ [ [name] | [glob] | [regex] ] ... ]

show running-config prober-pool
show running-config prober-pool [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

show prober-pool
show prober-pool [name]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt

DELETE
delete prober-pool [name]
```

Note: You must remove all references to a prober-pool before you can delete the prober-pool.

DESCRIPTION

You can use the prober-pool component to configure prober pool definitions on the Global Traffic Manager. You use prober pools to control which BIG-IP servers on your network are utilized by GTM to monitor the up/down state of GTM resources. Once defined, prober pools can be set to monitor whole data centers or individual servers.

EXAMPLES

```
create prober-pool my_pool members add {
  bigip-dallas
  bigip-london
}
```

Creates a Global Traffic Manager prober pool with two members bigip-dallas and bigip-london. Members are selected using the global-availability load balancing method.

```
delete prober-pool my_pool
```

Deletes the prober pool my_pool.

```
show prober-pool
```

Displays statistics for all prober pools.

```
list prober-pool my_pool
```

Displays settings of prober pool my_pool.

OPTIONS

app-service

Specifies the name of the application service to which this prober pool belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this prober pool. Only the application service can modify or delete this prober pool.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

load-balancing-mode

Specifies the load balancing mode that the system uses to select members of this pool. The default value is global-availability.

The options are:

global-availability

Specifies that the Global Traffic Manager selects the first available pool member in the order in which they are listed.

round-robin

Specifies that the Global Traffic Manager selects members using a circular, sequential pattern among available pool members.

members

Specifies the BIG-IP server names of the pool members. The default value is none.

You can also use the following options with prober pool members:

app-service

Specifies the name of the application service to which this prober pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this prober pool member. Only the application service can modify or delete this prober pool member.

description

User defined description.

[enabled | disabled]

Specifies whether this pool member is available to issue probes. The default value is enabled.

order

Specifies the order number of the pool member. The system uses this number with load balancing methods that involve

prioritizing pool members by listed order.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

BIG-IP 2013-04-12 gtm prober-pool(1)

gtm region

NAME
region - Configures a Global Traffic Manager(tm) region.

MODULE
gtm

SYNTAX
Configure the region component within the gtm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create region [name]
modify region [name]
options:
  app-service [[string] | none]
  description [string]
  [name]
  region-members
  options:
    app-service [[string] | none]
    continent [Africa | Antarctica | Asia | Australia | Europe
| North America | South America | unknown]
    country [two-letter abbreviation of country name]
    datacenter [name]
    geoip-isp [name]
    isp [AOL | BeijingCNC | CNC | ChinaTelecom | Comcast | Earthlink
| ShanghaiCNC | ShanghaiTelecom]
    not [continent | country | datacenter | isp | pool | region-name
| subnet]
    pool [name]
    region-name [name]
    state [name]
    subnet
```

```
edit region [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

```
DISPLAY
list region
list region [ [ [name] | [glob] | [regex] ] ... ]
show running-config region
show running-config region [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  one-line
```

```
DELETE
delete region [name]
```

DESCRIPTION

You can use the region component to create, display, modify, or delete a region. A region is a customized collection of topologies with which you can extend the topology functionality by defining specific geographical regions that have meaning for your network.

EXAMPLES

```
create region my_region continent Australia
```

Creates a region named my_region to populate with resources on the continent of Australia.

list region

Displays properties for all regions.

delete region my_region

Deletes the region named my_region.

OPTIONS

app-service

Specifies the name of the application service to which the region belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the region. Only the application service can modify or delete the region.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

region-members

Specifies the members that you want to add to, delete from, replace-all-with, or modify for this region.

You can specify the following options for region members:

app-service

Specifies the name of the application service to which the region member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the region member. Only the application service can modify or delete the region member.

continent

Specifies the name of a continent.

country

Specifies the two-letter abbreviation of a country. Use the command completion feature to view the numerous options.

datacenter

Specifies the name of an existing data center.

geoip-isp

An ISP whose IP Address allocation range should be used in matching topologies. Any ISP string may be given as long as it matches the string in the GeoIP-ISP Database. Case is irrelevant.

isp Specifies the name of an Internet service provider.

not Specifies region-members to exclude from this region.

pool Specifies the name of an existing pool.

region-name

Specifies the name of an existing region.

state

Specifies the name of an existing state.

subnet

Specifies an existing subnet.

SEE ALSO

BIG-IP 2015-01-28 gtm region(1)

NAME
rule - Opens an editor in which you can configure iRules(r) for traffic management system configuration.

MODULE
gtm

SYNTAX
Configure the rule component within the gtm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create rule [name]
modify rule [name]
option:
  metadata
    [add | delete | modify] {
[metadata_name] {
  value [ "value content" ]
  persist [ true | false ]
}
}
edit rule [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list rule
list rule [ [ [name] | [glob] | [regex] ] ... ]
show running-config rule
show running-config rule [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

show rule
show rule [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete rule [name]
```

Note: You can also delete metadata associated with an iRule. See the example section for detail.

DESCRIPTION
You can use iRules to direct traffic not only to specific pools, but also to individual pool members, including port numbers and URI paths, either to implement persistence or to meet specific load balancing requirements. The syntax that you use to write iRules is based on the Tools Command Language (Tcl) programming standard. Thus, you can use many of the standard Tcl commands, plus a robust set of extensions that the BIG-IP(r) local traffic management system provides to help you further increase load balancing efficiency.

For information about standard Tcl syntax, see <http://tmml.sourceforge.net/doc/tcl/index.html>. For a list of Tcl commands that have been disabled within the traffic management system and therefore cannot be used in the traffic management system, see the Configuration Guide for BIG-IP(r) Local Traffic Management(r). This guide is available at <https://support.f5.com>.

EXAMPLES

```
edit rule my_irule
```

Opens the vi editor in which you can edit the iRule named my_irule. Note that after you close the editor, you must run the command sequence save config to save the configuration changes to the stored configuration files.

The following are example iRules for the Global Traffic Manager(tm).

```
when DNS_REQUEST {
if {[IP::addr [IP::remote_addr]/24 equals 10.10.1.0/24] }
  {cname cname.siterequest.com } else { host 10.20.20.20}}
```

Specifies that requests from 10.10.1.0/24 be directed to cname.siterequest.com, and all other requests be directed to 10.20.20.20.

```
when DNS_REQUEST {
if {[whereis [IP::remote_addr]] contains "Asia"}
  {pool asia_pool} else {pool general_pool}}
```

Specifies that requests that originate in Asia be directed to the pool named asia_pool, and that all other requests be directed to the pool named general_pool.

metadata is the user defined key/value pair

Adds new metadata to named my_meta and modifies existing metadata named my_meta2 for the iRule named my_irule.

```
modify rule my_irule {
when DNS_REQUEST {
metadata replace-all-with {
my_meta { persist false value "hello"
}
my_meta2 { persist false value "hello
2"
}
} }
```

Deletes metadata named my_meta from the iRule named my_irule.

```
modify rule my_irule {  
when RULE_INIT {  
definition-checksum 7c0dba9aa53e8959042c6cfe041d3d11  
metadata delete { my_meta } }  
}
```

OPTIONS

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

metadata
Specifies a user-defined key/value pair.

name Specifies a unique name for the component. This option is required.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

DESCRIPTION

You can use the server component to configure a Global Traffic Manager server.

EXAMPLES

```
create server my_server devices add { my_device { addresses add {
10.10.1.1 } } } datacenter my_datacenter
```

Creates a server named my_server in my_datacenter with a self IP address of 10.10.1.1.

```
modify server my_server virtual-servers add {myVs { address
10.10.10.2:80 } }
```

Adds the virtual server myVs with an IP address of 10.10.10.2:80 as a resource to the server named my_server.

```
list server non-default-properties
```

Displays all non-default properties for all servers.

```
delete server my_server
```

Deletes the server named my_server.

```
show server my_server detail
```

Shows the link associated with each server IP address for my_server.

show server all detail

Shows the link assignments for all servers in the system.

show server my_server virtual-servers

Shows the regular server information as well as any virtuals on my_server. The link associated with a virtual server is displayed, or --- is shown to indicate that the virtual is not using a configured link.

OPTIONS

app-service

Specifies the name of the application service to which the server belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the server. Only the application service can modify or delete the server.

datacenter

Specifies the data center to which the server belongs. This option is required for the command create.

description

User defined description.

detail

The detail option is used with the show display command. This shows device statistics, virtual server statistics, and links associated with the server. Only the device addresses that have an associated link are displayed. If this server is not using any links, no link assignment information is printed. By default, links are automatically matched to device addresses according to the smallest subnet match. Explicit links may also be defined. How this link was assigned is displayed in the Link Assignment column: auto means that the system automatically assigned this link, and explicit means that the link was explicitly set by the user.

devices

Specifies the names of the devices that represent this server. Every device must have at least one address. The options are:

addresses

Specifies the IP addresses that represent the device. If GTM configuration synchronization is enabled and all existing addresses for a device are being replaced, new addresses should be added and synchronized before old addresses are removed, otherwise the changes may fail to synchronize. Alternatively, the address configuration changes can be performed on each GTM. The options are:

app-service

Specifies the name of the application service to which the address belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the address. Only the application service can modify or delete the address.

description

User defined description.

explicit-link-name

Specifies the explicit link name for the device. The default value is none.

translation

Specifies the internal IP address that corresponds to the external IP address of this device. The default value is ::.

app-service

Specifies the name of the application service to which the device belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the device. Only the application service can modify or delete the device.

description

User defined description.

[disabled | enabled]

Enables or disables the server. The default value is enabled.

expose-route-domains

Allow the GTM server to auto-discover LTM virtual servers from all route domains. The default value is no.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

iq-allow-path

Specifies whether the Global Traffic Manager uses this BIG-IP(r) system to conduct a path probe before delegating traffic to it. The default value is yes.

iq-allow-service-check

Specifies whether the Global Traffic Manager uses this BIG-IP system to conduct a service check probe before delegating traffic to it. The default value is yes.

iq-allow-snmp

Specifies whether the Global Traffic Manager uses this BIG-IP system to conduct an SNMP probe before delegating traffic to it.

The default value is yes.

`limit-cpu-usage`

For a server configured as a generic host, specifies the percent of CPU usage, otherwise has no effect. If percent of CPU usage goes above the limit, the system marks the server as unavailable.

`limit-cpu-usage-status`

Enables or disables the `limit-cpu-usage` option for this server. Only has an effect on a server configured as a generic host. The default value is disabled.

`limit-mem-avail`

For a server configured as a generic host, specifies the available memory required by the virtual servers on the server. If available memory falls below this limit, the system marks the server as unavailable.

`limit-mem-avail-status`

Enables or disables the `limit-mem-avail` option for this server. Only used on a server configured as a generic host. The default value is disabled.

`limit-max-bps`

Specifies the maximum allowable data throughput rate, in bits per second, for this server. If the network traffic volume exceeds this limit, the system marks the server as unavailable.

`limit-max-bps-status`

Enables or disables the `limit-max-bps` option for this server. The default value is disabled.

`limit-max-connections`

Specifies the maximum number of concurrent connections, combined, for this server. If the connections exceed this limit, the system marks the server as unavailable.

`limit-max-connections-status`

Enables or disables the `limit-max-connections` option for this server. The default value is disabled.

`limit-max-pps`

Specifies the maximum allowable data transfer rate, in packets per second, for this server. If the network traffic volume exceeds this limit, the system marks the server as unavailable.

`limit-max-pps-status`

Enables or disables the `limit-max-pps` option for this server. The default value is disabled.

`link-discovery`

Specifies whether the system auto-discovers the links for this server. The default value is disabled. The options are:

`disabled`

Specifies that the system does not auto-discover the links that are available for the server.

`enabled`

Specifies that the system auto-discovers the links that are configured on the server. With this option, the system automatically adds, deletes, and modifies link settings in the configuration.

`enabled-no-delete`

Specifies that the system auto-discovers the links that are configured on the server. With this option, the system automatically adds and modifies link settings in the configuration, but does not delete them. This option is useful when you regularly take links in and out of service.

`metadata`

Specifies user-defined data to associate with a server. By default the `persist` attribute is set to true. This means the data is saved into the configuration file.

`monitor`

Specifies the health monitors that the system uses to determine whether this server is available for load balancing. Multiple monitors may be specified with the `and` keyword. The `min` keyword is used to specify the minimum number of monitors that must succeed for this server to be declared up. The `require` keyword is used to specify the minimum number of probes that must succeed for this server to be declared up and the number of probes that should be used.

`name` Specifies a unique name for the component. This option is required for the commands `create` and `modify`.

`partition`

Displays the administrative partition within which the object resides.

`prober-fallback`

Specifies the type of prober to use to monitor this server's resources when the preferred type is not available. If this value is specified, it overrides the prober fallback value on this server's data center. The default value is `inherit`.

`prober-pool`

Specifies the name of a prober pool to use to monitor this server's resources when either the `prober-preference` or `prober-fallback` value is `pool`. If neither the `prober-preference` or `prober-fallback` value is `pool`, the `prober-preference` and `prober-`

fallback values are set to pool and any-available. If this value is specified, it overrides any prober pool set on this server's data center. The default value is none.

prober-preference

Specifies the type of prober to use to monitor this server's resources. If this value is specified, it overrides the prober preference value on this server's data center. The default value is inherit.

product

Specifies the server type. The server type determines the metrics that the system can collect from the server. Use the command completion feature to view the types of servers that are available.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

virtual-server-discovery

Specifies whether the system auto-discovers the virtual servers for this server. The default value is disabled. The options are:

disabled

Specifies that the system does not auto-discover the virtual servers that are configured on the server. With this option, you must configure the virtual servers for this server.

enabled

Specifies that the system auto-discovers the virtual servers that are configured on the server. With this option, the system automatically adds, deletes, and modifies virtual server settings in the configuration.

enabled-no-delete

Specifies that the system auto-discovers the virtual servers that are configured on the server. With this option, the system automatically adds and modifies virtual server settings in the configuration, but does not delete them. This option is useful when you regularly take virtual servers in and out of service.

virtual-servers

Specifies the name of the virtual servers that are resources for this server. You can include the following options for virtual servers.

app-service

Specifies the name of the application service to which the virtual server belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the virtual server. Only the application service can modify or delete the virtual server.

depends-on

Specifies the vs-name of the server on which this virtual server depends.

description

User defined description.

destination

Specifies the IP address and port of the virtual server.

[disabled | enabled]

Specifies whether this virtual server is available for load balancing. The default value is enabled.

explicit-link-name

Specifies the explicit link name for the virtual server. The default value is none.

limit-max-bps

Specifies the maximum allowable data throughput rate, in bits per second, for this virtual server. If the network traffic volume exceeds this value, the system marks the virtual server as unavailable. The default value is 0 (zero).

limit-max-bps-status

Enables or disables the limit-max-bps option for this virtual server. The default value is disabled.

limit-max-connections

Specifies the number of current connections allowed for this virtual server. If the current connections exceed this value, the system marks this virtual server as unavailable. The default value is 0 (zero).

limit-max-connections-status

Enables or disables the limit-max-connections option for this virtual server. The default value is disabled.

limit-max-pps

Specifies the maximum allowable data transfer rate, in packets per second, for this virtual server. If the network traffic volume exceeds this limit, the system marks the virtual server as unavailable. The default value is 0 (zero).

limit-max-pps-status

Enables or disables the limit-max-pps option for this virtual

server. The default value is disabled.

ltm-name

The virtual server name found on the LTM. Useful for differentiating between virtuals with same IP and port, but different protocols. The ltm-name used in probe requests.

monitor

Specifies the monitor you want to assign to this virtual server. Multiple monitors may be specified with the and keyword. The min keyword is used to specify the minimum number of monitors that must succeed for this server to be declared up. The require keyword is used to specify the minimum number of probes that must succeed for this server to be declared up and the number of probes that should be used. The default value is none.

translation-address

Specifies the public address that this virtual server translates into when the Global Traffic Manager communicates between the network and the Internet. The default value is ::.

translation-port

Specifies the translation port number or service name for the virtual server, if necessary. The default value is 0.

BIG-IP 2017-04-24 gtm server(1)

gtm topology

NAME

topology - Configures a topology statement.

MODULE

gtm

SYNTAX

Configure the topology component within the gtm module using the syntax shown in the following sections.

CREATE

create topology

options:

```
app-service [[string] | none]
description [[string] | none]
ldns: [continent | country | geoip-isp | isp | not | region | state | subnet]
server: [continent | country | datacenter | geoip-isp | isp | not | pool |
        region | state | subnet]
score [integer]
```

MODIFY

modify topology [[name] | [glob] | [regex]] ...]

options:

```
app-service [[string] | none]
description [[string] | none]
score [integer]
```

EDIT

edit topology [[name] | [glob] | [regex]] ...]

options:

```
all-properties
non-default-properties
```

DISPLAY

list topology

list topology [[name] | [glob] | [regex]] ...]

show running-config topology

show running-config topology [[name] | [glob] | [regex]] ...]

options:

```
all-properties
non-default-properties
one-line
```

DELETE

delete topology all

delete topology

[ldns: [identifier] [value] server: [identifier] [value]]

DESCRIPTION

You can use the topology component to configure a topology statement. A topology statement is a set of characteristics that identify the origin of a given name resolution request.

EXAMPLES

```
create topology ldns: country US server: datacenter DC1 score 30
```

Creates a topology statement that specifies that the Global Traffic Manager routes any traffic coming from the United States to the datacenter named DC1. Note that the weight of this topology item for load balancing is 30.

```
delete topology ldns: country US server: datacenter DC1
```

Deletes the topology statement mentioned in the previous example.

OPTIONS

app-service

Specifies the name of the application service to which the topology belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the topology. Only the application service can modify or delete the topology.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ldns:

Specifies the criteria that the Global Traffic Manager uses when matching requests from LDNS servers.

continent

A continent whose IP address allocation range should be used in matching topologies

country

A country whose IP address allocation range should be used in matching topologies

datacenter

A data center to be used in matching topologies

geoip-isp

An ISP whose IP Address allocation range should be used in matching topologies. Any ISP string may be given as long as it matches the string in the GeoIP-ISP Database. Case is irrelevant.

isp An ISP whose IP address allocation range should be used in matching topologies

not Specify a region member to exclude from the region

pool A pool to be used in matching topologies

region

Another region to be used in matching topologies

state

A state whose IP address allocation range should be used in matching topologies

subnet

A subnet to be used in matching topologies

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

score

Specifies the weight of the topology item.

server:

Specifies the server to which the Global Traffic Manager routes requests.

continent

A continent whose IP address allocation range should be used as an LDNS routing destination

country

A country whose IP address allocation range should be used as an LDNS routing destination

datacenter

A data center to be used as an LDNS routing destination

geoip-isp

An ISP whose IP Address allocation range should be used in matching topologies. Any ISP string may be given as long as it matches the string in the GeoIP-ISP Database. Case is irrelevant.

isp An ISP whose IP address allocation range should be used as an LDNS routing destination

not Specify an item to exclude from the group
pool A pool to be used as an LDNS routing destination
region
Another region to be used as an LDNS routing destination
state
A state whose IP address allocation range be used as an LDNS
routing destination
subnet
A subnet to be used as an LDNS routing destination

gtm traffic

NAME
traffic - Displays traffic statistics for the Global Traffic
Manager(tm).

MODULE
gtm

SYNTAX
Configure the traffic component within the gtm module using the syntax
in the following section.

DISPLAY
show traffic
options:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt

DESCRIPTION
You can use the traffic component to display traffic statistics,
including those for IPv4 and IPv6 requests, current Local Domain Name
System (LDNS) servers, and current paths.

SEE ALSO
show, sys tmm-traffic, tmsh

COPYRIGHT

DELETE
delete wideip a [all | [name] ]
```

DESCRIPTION

You can use the wideip component to create, modify, display, or delete a wide IP that responds to A queries. An A wide IP is a mapping of a fully-qualified domain name (FQDN) to a set of IPv4 virtual servers that host the domain's content, such as a web site or an e-commerce site.

EXAMPLES

```
create wideip a www.my_wide_ip.com

Creates a wide IP named www.my_wide_ip.com.

delete wideip a www.my_wide_ip.com

Deletes the wide IP named www.my_wide_ip.
```

OPTIONS

aliases
Specifies alternate domain names for the web site content you are load balancing. You can use two different wildcard characters, asterisk (*) and question mark (?), to represent one or more characters. The default value is none.

app-service
Specifies the name of the application service to which this wide ip belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this wide ip. Only the application service can modify or delete this wide ip.

description

User defined description. Note: Advanced search on the GUI's Wideip list page can be turned on/off by modifying the DB variable `ui.advancedsearch` via the `tmsh` command `"modify sys db ui.advancedsearch value true/false"`. This will result in a new description column and the inclusion of that field in the search.

[disabled | enabled]

Specifies whether the wide IP and its resources are available for load balancing.

failure-rcode

Specifies the DNS RCODE used when `failure-rcode-response` is enabled. Default is `noerror`. Options include `noerror` (no type exists at this name), `formerr` (format error in query), `servfail` (unable to process query), `nxdomain` (name does not exist), `notimpl` (no support for this kind of query), and `refused` (refuse to process based on policy). If `failure-rcode-ttl` is non-zero, only the Authority section of the `noerror` or `nxdomain` response will include a SOA record.

failure-rcode-response

When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This response is an authoritative empty answer from the system to A record requests. With this option enabled, the system responds faster to A requests for which it does not have A records configured. The default value is disabled.

failure-rcode-ttl

Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

last-resort-pool

Specifies a last resort pool to use when load balancing requests for this wide IP. Any A or CNAME pool type is allowed. The default value is none.

load-balancing-decision-log-verbosity

Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option `pool-selection`, the log will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option `pool-traversal`, the log will contain details of all pools traversed during load balancing. With the option `pool-member-selection`, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option `pool-member-traversal`, the log will contain details of all pool members traversed during load balancing. The default value is none.

minimal-response

Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

metadata

Specifies user-defined data to associate with a server. By default the `persist` attribute is set to true. This means the data is saved into the configuration file.

`name` Specifies a unique name for the component. This option is required for the commands `create` and `modify`.

partition

Displays the administrative partition within which the component resides.

persistence

When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4

Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6

Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

pools

Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

pools-cname

Configures the CNAME pools the system uses when load balancing

requests for this wide IP. The default value is none.

pool-lb-mode
Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is round-robin.

The available load balancing methods are:

global-availability
Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

ratio
Specifies that the system selects a pool based on the ratio that you assign to the pool.

round-robin
Specifies that the system selects pools sequentially.

topology
Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rules
Specifies the iRules(r) that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all iRules(r) on this wide IP. For each event, clauses are evaluated in the listed rules order. The default value is none.

t11-persistence
Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295 seconds. The default value is 3600.

topology-prefer-edns0-client-subnet
Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

DELETE
delete wideip aaaa [all | [name] ]

```

DESCRIPTION

You can use the wideip component to create, modify, display, or delete a wide IP that responds to AAAA queries. An AAAA wide IP is a mapping of a fully-qualified domain name (FQDN) to a set of IPv6 virtual servers that host the domain's content, such as a web site or an e-commerce site.

EXAMPLES

```

create wideip aaaa www.my_wide_ip.com

Creates a AAAA wide IP named www.my_wide_ip.com.

delete wideip aaaa www.my_wide_ip.com

Deletes the AAAA wide IP named www.my_wide_ip.

```

OPTIONS

aliases
Specifies alternate domain names for the web site content you are load balancing. You can use two different wildcard characters, asterisk (*) and question mark (?), to represent one or more characters. The default value is none.

app-service
Specifies the name of the application service to which this wide ip belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this wide ip. Only the application service can modify or delete this wide ip.

description
User defined description. Note: Advanced search on the GUI's Wideip list page can be turned on/off by modifying the DB variable ui.advancedsearch via the tmsh command "modify sys db ui.advancedsearch value true/false". This will result in a new description column and the inclusion of that field in the search.

[disabled | enabled]

Specifies whether the wide IP and its resources are available for load balancing.

failure-rcode

Specifies the DNS RCODE used when failure-rcode-response is enabled. Default is noerror. Options include noerror (no type exists at this name), formerr (format error in query), servfail (unable to process query), nxdomain (name does not exist), notimpl (no support for this kind of query), and refused (refuse to process based on policy). If failure-rcode-ttl is non-zero, only the Authority section of the noerror or nxdomain response will include a SOA record.

failure-rcode-response

When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This response is an authoritative empty answer from the system to AAAA record requests. With this option enabled, the system responds faster to AAAA requests for which it does not have AAAA records configured. The default value is disabled.

failure-rcode-ttl

Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

last-resort-pool Specifies a last resort pool to use when load balancing requests for this wide IP. Any AAAA or CNAME pool type is allowed. The default value is none.

load-balancing-decision-log-verbosity

Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option pool-selection, the log will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option pool-traversal, the log will contain details of all pools traversed during load balancing. With the option pool-member-selection, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option pool-member-traversal, the log will contain details of all pool members traversed during load balancing. The default value is none.

minimal-response

Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

metadata

Specifies user-defined data to associate with a server. By default the persist attribute is set to true. This means the data is saved into the configuration file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which the component resides.

persistence

When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4

Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6

Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

pools

Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

pools-cname

Configures the CNAME pools the system uses when load balancing requests for this wide IP. The default value is none.

pool-lb-mode

Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is round-robin.

The available load balancing methods are:

global-availability
Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

ratio
Specifies that the system selects a pool based on the ratio that you assign to the pool.

round-robin
Specifies that the system selects pools sequentially.

topology
Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rules
Specifies the iRules(r) that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all iRules(r) on this wide IP. For each event, clauses are evaluated in the listed rules order. The default value is none.

t11-persistence
Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295 seconds. The default value is 3600.

topology-prefer-edns0-client-subnet
Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

```

DESCRIPTION

You can use the wideip component to create, modify, display, or delete a wide IP that responds to CNAME queries. A CNAME wide IP is a mapping of a fully-qualified domain name (FQDN) to its canonical name.

EXAMPLES

```

create wideip cname www.my_wide_ip.com

Creates a CNAME wide IP named www.my_wide_ip.com.

delete wideip cname www.my_wide_ip.com

Deletes the CNAME wide IP named www.my_wide_ip.

```

OPTIONS

aliases
Specifies alternate domain names for the web site content you are load balancing. You can use two different wildcard characters, asterisk (*) and question mark (?), to represent one or more characters. The default value is none.

app-service
Specifies the name of the application service to which this wide ip belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this wide ip. Only the application service can modify or delete this wide ip.

description
User defined description. Note: Advanced search on the GUI's Wideip list page can be turned on/off by modifying the DB variable ui.advancedsearch via the tmsh command "modify sys db ui.advancedsearch value true/false". This will result in a new description column and the inclusion of that field in the search.

[disabled | enabled]
Specifies whether the wide IP and its resources are available for load balancing.

failure-rcode
Specifies the DNS RCODE used when failure-rcode-response is enabled. Default is noerror. Options include noerror (no type exists at this name), formerr (format error in query), servfail (unable to process query), nxdomain (name does not exist), notimpl (no support for this kind of query), and refused (refuse to process based on policy). If failure-rcode-ttl is non-zero, only the Authority section of the noerror or nxdomain response will include a SOA record.

failure-rcode-response

When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This response is an authoritative empty answer from the system to CNAME record requests. With this option enabled, the system responds faster to CNAME requests for which it does not have CNAME records configured. The default value is disabled.

failure-rcode-ttl

Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

last-resort-pool

Specifies a last resort pool to use when load balancing requests for this wide IP. Any CNAME pool type is allowed. The default value is none.

load-balancing-decision-log-verbosity

Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option pool-selection, the log will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option pool-traversal, the log will contain details of all pools traversed during load balancing. With the option pool-member-selection, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option pool-member-traversal, the log will contain details of all pool members traversed during load balancing. The default value is none.

minimal-response

Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

metadata

Specifies user-defined data to associate with a server. By default the persist attribute is set to true. This means the data is saved into the configuration file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which the component resides.

persistence

When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4

Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6

Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

pools

Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

pool-lb-mode

Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is round-robin.

The available load balancing methods are:

global-availability

Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

ratio

Specifies that the system selects a pool based on the ratio that you assign to the pool.

round-robin

Specifies that the system selects pools sequentially.

topology

Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rules

Specifies the iRules(r) that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all iRules(r) on this wide IP. For each event, clauses are evaluated in the listed rules order. The default value is none.

ttd-persistence

Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295 seconds. The default value is 3600.

topology-prefer-edns0-client-subnet

Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

DESCRIPTION

You can use the wideip component to create, modify, display, or delete a wide IP that responds to MX queries. An MX wide IP maps a domain's mail address to a set of hosts acting as mail servers.

EXAMPLES

```

create wideip mx mydomain.com

Creates an MX wide IP named mydomain.com.

delete wideip mx mydomain.com

Deletes the MX wide IP named mydomain.com.

```

OPTIONS

aliases
Specifies alternate domain names for the web site content you are load balancing. You can use two different wildcard characters, asterisk (*) and question mark (?), to represent one or more characters. The default value is none.

app-service
Specifies the name of the application service to which this wide ip belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this wide ip. Only the application service can modify or delete this wide ip.

description
User defined description. Note: Advanced search on the GUI's Wideip list page can be turned on/off by modifying the DB variable ui.advancedsearch via the tmsh command "modify sys db ui.advancedsearch value true/false". This will result in a new description column and the inclusion of that field in the search.

[disabled | enabled]
Specifies whether the wide IP and its resources are available for load balancing.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

failure-rcode
Specifies the DNS RCODE used when failure-rcode-response is enabled. Default is noerror. Options include noerror (no type exists at this name), formerr (format error in query), servfail (unable to process query), nxdomain (name does not exist), notimpl (no support for this kind of query), and refused (refuse to process based on policy). If failure-rcode-ttl is non-zero, only the Authority section of the noerror or nxdomain response will include a SOA record.

failure-rcode-response
When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This response is an authoritative empty answer from the system to MX record requests. With this option enabled, the system responds faster to MX requests for which it does not have MX records configured. The default value is disabled.

failure-rcode-ttl

Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

last-resort-pool

Specifies a last resort pool to use when load balancing requests for this wide IP. Any MX or CNAME pool type is allowed. The default value is none.

load-balancing-decision-log-verbosity

Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option pool-selection, the log will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option pool-traversal, the log will contain details of all pools traversed during load balancing. With the option pool-member-selection, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option pool-member-traversal, the log will contain details of all pool members traversed during load balancing. The default value is none.

minimal-response

Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

metadata

Specifies user-defined data to associate with a server. By default the persist attribute is set to true. This means the data is saved into the configuration file.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which the component resides.

persistence

When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4

Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6

Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

pools

Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

pools-cname

Configures the CNAME pools the system uses when load balancing requests for this wide IP. The default value is none.

pool-lb-mode

Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is round-robin.

The available load balancing methods are:

global-availability

Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

ratio

Specifies that the system selects a pool based on the ratio that you assign to the pool.

round-robin

Specifies that the system selects pools sequentially.

topology

Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression])

to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rules

Specifies the iRules(r) that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all iRules(r) on this wide IP. For each event, clauses are evaluated in the listed rules order. The default value is none.

ttd-persistence

Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295 seconds. The default value is 3600.

topology-prefer-edns0-client-subnet

Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

DELETE
delete wideip naptr [all | [name] ]

DESCRIPTION
You can use the wideip component to create, modify, display, or delete
a wide IP that responds to NAPTR queries. A NAPTR wide IP is a mapping
of a fully-qualified domain name (FQDN) to a set of either services or
hosts defined under that name.

EXAMPLES
create wideip naptr example.com

Creates a NAPTR wide IP named example.com.

delete wideip naptr example.com

Deletes the NAPTR wide IP named example.com.

OPTIONS
aliases
Specifies alternate domain names for the web site content you are
load balancing. You can use two different wildcard characters,
asterisk (*) and question mark (?), to represent one or more
characters. The default value is none.

app-service
Specifies the name of the application service to which this wide
ip belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete this wide ip. Only the application
service can modify or delete this wide ip.

description
User defined description. Note: Advanced search on the GUI's
Wideip list page can be turned on/off by modifying the DB variable
ui.advancedsearch via the tmsh command "modify sys db
ui.advancedsearch value true/false". This will result in a new
description column and the inclusion of that field in the search.

[disabled | enabled]
Specifies whether the wide IP and its resources are available for
load balancing.

glob Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

failure-rcode
Specifies the DNS RCODE used when failure-rcode-response is
enabled. Default is noerror. Options include noerror (no type
exists at this name), formerr (format error in query), servfail
(unable to process query), nxdomain (name does not exist), notimpl
(no support for this kind of query), and refused (refuse to
process based on policy). If failure-rcode-ttl is non-zero, only
the Authority section of the noerror or nxdomain response will
include a SOA record.

failure-rcode-response
When enabled, specifies that the system returns a RCODE response
to Wide IP requests after exhausting all load-balancing methods.
This response is an authoritative empty answer from the system to
NAPTR record requests. With this option enabled, the system
responds faster to NAPTR requests for which it does not have NAPTR
records configured. The default value is disabled.

failure-rcode-ttl
Specifies the negative caching TTL of the SOA for the RCODE
response. The default is 0, meaning no SOA is included (i.e. no
caching).

last-resort-pool
Specifies a last resort pool to use when load balancing requests
for this wide IP. Any NAPTR or CNAME pool type is allowed. The

```

default value is none.

load-balancing-decision-log-verbosity
Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option **pool-selection**, the log will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option **pool-traversal**, the log will contain details of all pools traversed during load balancing. With the option **pool-member-selection**, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option **pool-member-traversal**, the log will contain details of all pool members traversed during load balancing. The default value is none.

minimal-response
Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

metadata
Specifies user-defined data to associate with a server. By default the **persist** attribute is set to true. This means the data is saved into the configuration file.

name Specifies a unique name for the component. This option is required for the commands **create** and **modify**.

partition
Displays the administrative partition within which the component resides.

persistence
When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

persist-cidr-ipv4
Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

persist-cidr-ipv6
Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

pools
Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

pools-cname
Configures the CNAME pools the system uses when load balancing requests for this wide IP. The default value is none.

pool-lb-mode
Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is round-robin.

The available load balancing methods are:

global-availability
Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

ratio
Specifies that the system selects a pool based on the ratio that you assign to the pool.

round-robin
Specifies that the system selects pools sequentially.

topology
Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (**@[regular expression]**) to indicate that the identifier is a regular expression. See help **regex** for a description of regular expression syntax.

rules
Specifies the **iRules(r)** that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all **iRules(r)** on this wide IP. For each event, clauses are evaluated

in the listed rules order. The default value is none.

ttl-persistence

Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295 seconds. The default value is 3600.

topology-prefer-edns0-client-subnet

Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

DELETE
delete wideip srv [all | [name] ]

```

DESCRIPTION

You can use the wideip component to create, modify, display, or delete a wide IP that responds to SRV queries. An SRV wide IP is a mapping of a fully-qualified domain name (FQDN) specifying a particular service of a domain to a host and port that provides the service.

EXAMPLES

```

create wideip srv _imap._tcp.mydomain.com

Creates an SRV wide IP named _imap._tcp.mydomain.com.

delete wideip srv _imap._tcp.mydomain.com

Deletes the SRV wide IP named _imap._tcp.mydomain.com.

```

OPTIONS

aliases
Specifies alternate domain names for the web site content you are load balancing. You can use two different wildcard characters, asterisk (*) and question mark (?), to represent one or more characters. The default value is none.

app-service
Specifies the name of the application service to which this wide ip belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this wide ip. Only the application service can modify or delete this wide ip.

description
User defined description. Note: Advanced search on the GUI's Wideip list page can be turned on/off by modifying the DB variable ui.advancedsearch via the tmsh command "modify sys db ui.advancedsearch value true/false". This will result in a new description column and the inclusion of that field in the search.

[disabled | enabled]
Specifies whether the wide IP and its resources are available for load balancing.

failure-rcode
Specifies the DNS RCODE used when failure-rcode-response is enabled. Default is noerror. Options include noerror (no type exists at this name), formerr (format error in query), servfail (unable to process query), nxdomain (name does not exist), notimpl (no support for this kind of query), and refused (refuse to process based on policy). If failure-rcode-ttl is non-zero, only the Authority section of the noerror or nxdomain response will include a SOA record.

failure-rcode-response
When enabled, specifies that the system returns a RCODE response to Wide IP requests after exhausting all load-balancing methods. This response is an authoritative empty answer from the system to SRV record requests. With this option enabled, the system responds faster to SRV requests for which it does not have SRV records configured. The default value is disabled.

failure-rcode-ttl
Specifies the negative caching TTL of the SOA for the RCODE response. The default is 0, meaning no SOA is included (i.e. no caching).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

last-resort-pool
Specifies a last resort pool to use when load balancing requests for this wide IP. Any SRV or CNAME pool type is allowed. The default value is none.

load-balancing-decision-log-verbosity
Specifies the amount of detail logged when making load balancing decisions. This is used for debugging purpose only. Performance will be affected if the value is not none. Please reset it back to none after done debugging. With the option pool-selection, the log

will contain pool load balancing algorithm details. This includes common actions taken to a set of pools (for example, whether all pools reset the ratio counter during the algorithm) and the result of the load balancing algorithm (for example, whether a pool is finally selected and the reason if applicable). With the option `pool-traversal`, the log will contain details of all pools traversed during load balancing. With the option `pool-member-selection`, the log will contain pool member load balancing algorithm details. This includes common actions taken to a set of pool members and the result of the load balancing algorithm. With the option `pool-member-traversal`, the log will contain details of all pool members traversed during load balancing. The default value is none.

`minimal-response`

Specifies GTM will form the smallest allowable DNS response to a query. Typically, this will be a single resource record in the answer section. When set to disabled, GTM will attempt to chase CNAME chains, if required, to obtain the ultimate answer, and it will attempt to add address resource records to the additional section of the response for each answer when needed. The default value is enabled.

`metadata`

Specifies user-defined data to associate with a server. By default the `persist` attribute is set to true. This means the data is saved into the configuration file.

`name` Specifies a unique name for the component. The format of an SRV wide IP name is governed by RFC. The general form is 'service.protocol.domain labels'. This option is required for the commands `create` and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`persistence`

When enabled, specifies that when a local DNS server makes repetitive requests on behalf of a client, the system reconnects the client to the same resource as previous requests. The default value is disabled.

`persist-cidr-ipv4`

Specifies a mask used to group IPv4 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

`persist-cidr-ipv6`

Specifies a mask used to group IPv6 LDNS addresses. This feature allows one persistence record to be shared by LDNS addresses that match within this mask.

`pools`

Configures the pools the system uses when load balancing requests for this wide IP. The default value is none.

`pools-cname`

Configures the CNAME pools the system uses when load balancing requests for this wide IP. The default value is none.

`pool-lb-mode`

Specifies the load balancing method used to select a pool in this wide IP. This option is relevant only when multiple pools are configured for this wide IP. The default value is `round-robin`.

The available load balancing methods are:

`global-availability`

Specifies that the system selects a pool by following the order of the Pool list. The system repeatedly selects the first pool in the list for as long as its status is available. If the pool becomes unavailable for any reason, the system then repeatedly selects the next pool in the list, and so on.

`ratio`

Specifies that the system selects a pool based on the ratio that you assign to the pool.

`round-robin`

Specifies that the system selects pools sequentially.

`topology`

Specifies that the system selects a pool based on topology information in the incoming LDNS request. Note that this load balancing method works only if you have configured a topology statement.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`rules`

Specifies the `iRules(r)` that this wide IP uses for load balancing decisions. 'when' clauses for each event are grouped across all `iRules(r)` on this wide IP. For each event, clauses are evaluated in the listed rules order. The default value is none.

`ttd-persistence`

Specifies, in seconds, the length of time for which a persistence entry is valid. This value can range from 0 through 4294967295

seconds. The default value is 3600.

topology-prefer-edns0-client-subnet
Specifies, when set to enabled, that this wide IP should use the edns0 client subnet option (if one exists) instead of the source address when using topology load balancing. When this option is set to disabled or if the query did not contain a client subnet option, the system will fall back to the source address.

This setting has no effect when the global setting, configured under gtm global-settings load-balancing topology-prefer-edns0-client-subnet [disabled | enabled], is set to enabled. When either setting is enabled then this feature will be enabled.

ilx

ilx global-settings

NAME

global-settings - system-wide settings for iRules Language Extension (ILX) Plugin.

MODULE

ilx

SYNTAX

The global-settings can be displayed/modified with the following syntax:

MODIFY

```
modify global-settings [name]
options:
  debug-port-blacklist add/delete/replace-all-with { [port] }
  log-publisher [name]
```

DISPLAY

```
list global-settings [name]
options:
  debug-port-blacklist
```

DESCRIPTION

An iRules Language Extension (ILX) plugin global-settings profile a way to store system-wide settings.

EXAMPLES

```
list ilx global-settings
See the current settings
```

```
modify global-settings debug-port-blacklist add { 20001 }
Add port 20001 to the list of reserved ports that cannot be used
to attach node inspector.
```

OPTIONS

debug-port-blacklist
Specifies the list of reserved ports that cannot be used to attach node inspector in case debugging is enabled.

log-publisher Specifies the log destination for messages generated by the ILXLogger nodejs object in an extension without a plugin or extension level log publisher.

SEE ALSO

ilx plugin, modify, list

```

DESCRIPTION

An iRules Language Extension (ILX) plugin provides the following functionality:

- An RPC interface that allows an iRule to communicate with an ILX Node.js(tm) process.
- A Streaming interface that allows an ILX Node.js(tm) process to manage Virtual Server connections and payload data.

A plugin is created from an ilx workspace. Files from the workspace are copied into a system area and run from the system area. iRule files contained in the workspace are read into the system as ltm rule configuration. The ltm rule configuration objects are created in a sys folder that has the same name as the plugin.

The system will start one or more Node.js(tm) process for each extension (see also concurrency-mode below). Node.js(tm) will look in the extension directory for the file package.json. Node.js(tm) will look in package.json for a main field that identifies the main entry point of the plugin. If the main field is not present node will look for the file index.js.

The status of plugin processes can be viewed with the show command.

```
show plugin my_plugin
```

A plugin can be started, stopped and restarted. When a plugin is initially created the system will start processes for each extension. When a plugin is stopped existing plugin processes associated with active tmm connections are allowed to drain. Draining processes continue to run until the connections are closed. There are several options that control how processes are stopped, drain-existing-connections, immediate and stop-draining, and are describe below.

There are several ILX commands that an iRule may use to communicate with a Node.js(tm) extension process: ILX::init, ILX::call and ILX::notify.

ILX::init [plugin name] [extension name] establishes a communication path from an iRule to the node process. It returns a handle that must be passed to ILX::call and ILX::notify.

ILX::call [ILX handle] [method] [optional arg 1] [optional arg 2] invokes the specified node method in the extension associated with the ILX handle. If the node method returns a javascript array or dictionary then a Tcl list object is returned from ILX::call, otherwise a Tcl string object is returned.

ILX::notify [ILX handle] [method] [optional arg 1] [optional arg 2] sends a message to the node method but does not wait for the method to complete before returning. TCL_OK is returned if the message was successfully queued. Any other return value indicates the message could not be queued.

RPC

The RPC API consists of two primary components, Node.js and Tcl.

The Node.js API contains an ILXServer class. Methods are added to the server using ILXServer.addMethod("method name", function(req, res) { ... }). "req" is an ILXRequest object and "res" is an ILXResponse object. ILXServer.listen will start the server.

```
A Tcl iRule connects to the Node.js process using the Tcl command
set plugin [ILX::init "plugin name" "extension name"]
```

```
The Javascript methods are invoked from a Tcl iRule using either
ILX::call or ILX::notify. The args are user defined and passed to the
Node.js method via the ILXRequest object.
set response [ILX::call $plugin "method name" args...]
```

```
ILX::notify is similar to ILX::call except that the iRule will not wait
for a response from the Node.js process.
ILX::call $plugin "method name" args...]
```

Here is a Hello World Node.js script

```
var f5 = require('f5-nodejs');
var server = new f5.ILXServer();
server.addMethod("hello_world", function(req, res) {
console.log("request args: " + JSON.stringify(req));
res.reply('hello_world');
});
server.listen();
```

Here is the Hello World Tcl iRule that passes some data to the Node.js process, waits for a response and logs the response to /var/log/ltn. The iRule must be associated with an ltm virtual-server.

```
when CLIENT_ACCEPTED {
set plugin [ILX::init rpc example]
set rv [ILX::call $plugin hello_world arg1 vall arg2 val2]
log local0.debug $rv
}
```

Run the following tmsh commands to create the ilx workspace and ilx plugin configuration for the RPC example above. See also help ilx workspace for more examples describing how to manage a workspace.

```
create ilx workspace rpc
```

```
create ilx workspace rpc extension example
```

```
edit ilx workspace rpc extension example
```

A file named index.js will be created. Replace the content of index.js with the Node.js Hello World script above. If you have bash shell access you can directly edit the file /var/ilx/workspaces/Common/rpc/extensions/example/index.js.

```
edit ilx workspace rpc rule example
```

A file named rpc_example.tcl will be created. Replace the content of rpc_example.tcl with the Tcl iRule Hello World example above. If you have bash shell access you can directly edit the file /var/ilx/workspaces/Common/rpc/rules/hello_world.tcl.

```
create ilx plugin rpc from-workspace rpc
```

```
modify ltm virtual [name] rules { rpc/example }
```

You must create a Virtual Server and associate the rpc_example rule with the Virtual Server. When a client connects to the Virtual Server you should see the output from both the Node.js process and Tcl iRule in /var/log/ltn.

See also the BIG-IP iRulesLX User Guide located in the Programmability Wiki at devcentral.f5.com.

Streaming

The Streaming API allows a Node.js Plugin process to act as a proxy for connections through a Virtual Server. When a client connects to a Virtual Server an ILXFlow object is created and passed to the plugin. The ILXFlow object contains two Node.js sockets. ILXFlow.client represents the connection from the client to the plugin. ILXFlow.server represents the connection from the plugin to a server. The plugin will use ILXFlow.client to receive or send data to the client. The plugin will use ILXFlow.server to send or receive data from the server. The plugin may inspect or modify any/all client or server data. The ILXFlow.client and ILXFlow.server objects behave as native Node.js sockets. The plugin can also be configured to act as a server and respond directly to the client without completing a connection to a server. The plugin can also be configured as a native Node.js HTTP server.

```
[Client] <-> [Virtual Server] <-> [TMM]
  |
  v
[ILXFlow.client]
[Plugin]
[ILXFlow.server]
```

```

^
|
v
[TMM] <-> [Server]

```

Note that the plugin sees TCP payload. TCP headers are stripped by the TMM and are not visible to the plugin.

The following is a brief overview of the Javascript classes that make up the Streaming API. These classes contain many more features and options as described in the BIG-IP iRulesLX User Guide located in the Programmability Wiki at devcentral.f5.com.

ILXPlugin - Connects to the TMM to accept Virtual Server client connections. When a connection is made an ILXFlow object is passed to the plugin via the "connect" event: `plugin.on("connect", function(flow) { ... })`.

ILXPluginOptions - Options that configure the events and data that a plugin will received.

ILXFlow - An object that represents a client socket to Virtual Server and server socket to a server.

ILXStream - An object that represents the client side connection from a client to a Virtual Server (`ILXFlow.client`), the server side connection from a Virtual Server to a server (`ILXFlow.server`), or a plugin initiated connection to a server (created using `ILXStream.connect`).

ILXLbOptions - Options that allow the plugin to specify which server the client will connect to by calling `ILXFlow.lbSelect(ILXLbOptions)`.

ILXTable - Functions for reading and writing the TMM Session DB. Very similar interface to the Tcl `iRule` table command.

ILXBufferUtil - Functions for searching and modifying a Node.js Buffer object.

ILXDatagroup - Functions for accessing ltm data-group configuration. The set of data-groups available to a plugin must be specified using the `ILXPluginOptions` when the plugin is started.

ILXTransaction - If HTTP and ILX profiles are attached to a virtual server then all header and data inspection and modification are done in the context of request and response transaction. An `ILXTransaction` object is passed to the following events: `requestStart`, `requestComplete`, `responseStart` and `responseComplete`. The `ILXTransaction` object contains things like request headers, URI and method, and response headers and status.

The following is a sample streaming plugin that acts as a pass through. Data is read from the client and sent to the server. Data is read from the server and sent to the client. Note that it is important to handle "error" events as the Node.js plugin process will exit if they are not handled.

```

var f5 = require("f5-nodejs");
var plugin = new f5.ILXPlugin();
plugin.on("connect", function(flow) {
  flow.client.on("readable", function() {
    var buffer;
    while (true) {
      buffer = flow.client.read();
      if (buffer === null) {
        break;
      }
      console.log("Client Data");
      console.log(buffer.toString());
      flow.server.write(buffer);
    }
  });
  flow.client.on("error", function(err) {
    console.log("client socket error: " + err);
  });
  flow.server.on("readable", function() {
    var buffer;
    while (true) {
      buffer = flow.server.read();
      if (buffer === null) {
        break;
      }
      console.log("Server Data");
      console.log(buffer.toString());
      flow.client.write(buffer);
    }
  });
  flow.server.on("error", function(err) {
    console.log("server socket error: " + err);
  });
  flow.on("error", function(err) {
    console.log("flow error: " + err);
  });
});
var options = new f5.ILXPluginOptions(); // use defaults
plugin.start(options);

```

The following is a sample streaming HTTP plugin that acts as a pass through. Note that the example above can also be used to manage HTTP traffic. This example requires a Virtual Server with both HTTP and ILX profiles.

```

var f5 = require('f5-nodejs');
var plugin = new f5.ILXPlugin();
plugin.on("connect", function(flow)

```

```

{
    flow.client.on("requestStart", function(request) {
        // HTTP request URI, headers and more
        console.log(
            "requestStart: " + JSON.stringify(request.params));
    });
    flow.client.on("readable", function() {
        // HTTP request body, if present
        var buf;
        while (true) {
            buf = flow.client.read();
            if (buf !== null) {
                console.log("request body:" + buf.length + " bytes");
                console.log(buf.toString());
                flow.server.write(buf);
            }
            else {
                break;
            }
        }
    });
    flow.client.on("requestComplete", function(request) {
        // Entire HTTP request received
        console.log(
            "requestComplete: " + JSON.stringify(request.params));
        request.complete();
    });
    flow.client.on("error", function(err) {
        console.error("flow.client error:" + err);
    });

    flow.server.on("responseStart", function(response) {
        // HTTP response headers, status and more
        console.log(
            "responseStart: " + JSON.stringify(response.params));
    });
    flow.server.on("readable", function() {
        // HTTP response body, if present
        var buf;
        while (true) {
            buf = flow.server.read();
            if (buf !== null) {
                console.log(
                    "response body:" + buf.length + " bytes");
                console.log(buf.toString());
                flow.client.write(buf);
            }
            else {
                break;
            }
        }
    });
    flow.server.on("responseComplete", function(response) {
        // Entire HTTP response received
        console.log(
            "responseComplete: " + JSON.stringify(response.params));
        response.complete();
    });
    flow.server.on("error", function(err) {
        console.error("flow.server error:" + err);
    });
    flow.on("error", function(err) {
        console.error("flow.error:" + err);
    });
});
var options = new f5.ILXPluginOptions(); // use defaults
plugin.start(options);

```

Run the following tmsh commands to create ilx workspace and ilx plugin configuration for a streaming plugin using either of the sample plugins above.

```

create ilx workspace streaming
create ilx workspace streaming extension example
edit ilx workspace streaming extension example

```

A file named index.js will be created. Replace the content of index.js with the Node.js streaming example from above. If you have bash shell access you can directly edit the file /var/ilx/workspaces/Common/streaming/extensions/example/index.js.

```

create ilx plugin streaming from-workspace streaming
modify ilx plugin streaming extensions { example { ilx-logging
    enabled concurrency-mode single } }

```

When ilx-logging is enabled all stdout and stderr from the plugin is sent to /var/log/ilx/.., in this case /var/log/ilx/Common.streaming.example.

```

create ltm profile ilx streaming-profile plugin streaming
modify ltm virtual [name] profiles replace-all-with {
    tcp streaming-profile }

```

You must create a Virtual Server and associate the streaming-profile with the Virtual Server. When a client connects to the Virtual Server the client should receive the server data. The plugin also logs the client and server data that is received to /var/log/ilx/Common.streaming.example. If you are using the HTTP sample you will need to assign an HTTP

profile to the virtual server.

EXAMPLES

```
create plugin my_plugin from-workspace my_workspace
```

Creates a plugin named `my_plugin`. Rule files from the workspace are read into the system configuration and placed in the `sys` folder `my_plugin`.

```
modify plugin my_plugin from-workspace my_workspace
```

Restart the plugin using the current files in `my_workspace`.

```
modify plugin my_plugin extensions { my_extension { concurrency-mode dedicated } }
```

Modify the `concurrency-mode` for a specific extension.

```
delete plugin my_plugin
```

Deletes the plugin named `my_plugin`. The `iRule` configuration in the `sys` folder named `my_plugin` will also be deleted. The `sys` folder `my_plugin` will be deleted if there are no remaining (non-plugin related) configuration items in the folder.

```
list plugin
```

List the configuration for all plugins in the current `sys` folder.

```
list plugin my_plugin
```

List the configuration for `my_plugin`.

```
show plugin my_plugin
```

Displays the status of all extension processes running as part of `my_plugin`.

```
show plugin my_plugin extensions { my_extension }
```

Displays the status of processes in extension `my_extension` running as part of `my_plugin`.

```
reset-stats plugin my_plugin
```

Reset all statistics for `my_plugin`.

```
reset-stats plugin my_plugin extensions { my_extension }
```

Reset statistics for the extension `my_extension` in `my_plugin`.

```
start plugin my_plugin
```

Starts all extensions in `my_plugin`.

```
stop plugin my_plugin
```

Stops all extensions in `my_plugin`. Active processes and connections are allowed to drain.

```
stop plugin my_plugin drain-existing-connections
```

Stops all extension processes in `my_plugin`. Active connections that are currently using the plugin are allowed to drain. The plugin processes will be stopped when all associated active connections are closed.

```
stop plugin my_plugin immediate
```

Immediately stops all extension processes associated with `my_plugin`. New and existing connections to Virtual Servers that have `iRules` that interact with the plugin will receive a `Tcl` error when using the `Tcl` functions `ILX::init` and `ILX::call`.

```
stop plugin my_plugin stop-draining
```

Immediately stops all extension processes in `my_plugin` that are draining. Existing connections that have `iRules` that interact with the plugin and were attached to the draining processes will receive a `Tcl` error when using the `Tcl` functions `ILX::init` and `ILX::call`.

OPTIONS

`app-service`

Specifies the name of the application service to which the pool belongs. The default value is `none`. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the plugin. Only the application service can modify or delete the plugin.

`description`

User defined description.

`disabled`

Disable the plugin. All node processes associated with the plugin that are associated with active `tmm` connections are allowed to continue until the connections close. To immediately stop all processes use the `stop` command.

`enabled`

Enable the plugin. Node processes will be started for each plugin extension.

`extensions`

Modify attributes of plugin extensions.

command-arguments

The optional list of arguments to be passed to the nodejs (after the extension).

Eg.:

```
command-arguments { arg1 arg2 }
```

will result in nodejs process started like this:
/usr/bin/nodejs /extensions/ arg1 arg2

The plugin must be restarted for this setting to take affect.

command-options

The list of options passed to Node.js before the name of the extension script. These must be valid Node.js options. The Node.js process will fail to start if it is provided with invalid options.

Example:

```
command-options { --debug-brk=12345 }
```

will result in nodejs process started like this:
/usr/bin/nodejs --debug-brk=12345 /extensions/

Please note the choice of the specified port is not guaranteed. If the specified port is not available, the system will choose another consecutive port (see Debugging section for more details).

The plugin must be restarted for this setting to take affect.

concurrency-mode

Specifies a concurrency mode for the extension.

The value dedicated specifies that a node process should be started for each tmm that has been provisioned (see sys db provision.tmmcountactual). Each node process will be dedicated to servicing requests from a single tmm.

The value single specifies that a single node process should be started. This node process will service requests from all tmm processes in the system.

data-groups

The set of data-groups that will be made available to the plugin through the ILXDatagroup JavaScript class. The default value is none.

debug-port-range-high

When debugging is enabled and the debug port is not specified in command-options, ILX will assign the port, searching for an available port to attach the node inspector, see the section on Debugging. It will start searching at the debug-port-range-low value and try each port until it reaches the debug-port-range-high value.

debug-port-range-low

When debugging is enabled and the debug port is not specified in command-options, ILX will assign the port, searching for an available port to attach the node inspector, see the section on Debugging. It will start searching at the debug-port-range-low value and try each port until it reaches the debug-port-range-high value.

description

User defined description.

heartbeat-interval

Specifies the maximum number of seconds between extension process heartbeats. The extension process heartbeat is updated by the BIG-IP version of libuv. The BIG-IP monitors the heartbeat of each extension process. When enabled the system will restart an extension process if the extension does not update its heartbeat over the configured interval. A value of 0 (zero) disables heartbeat checking. The heartbeat should be disabled when the extension is being debugged.

ilx-logging

Specifies where standard out and standard error generated by the plugin will be logged. A value of disabled will cause output to be logged to /var/log/ltn. A value of enabled will cause output to be logged to /var/log/ilx/[plugin].[extension] (enabled). A CPU identifier will be appended to the log file name if the concurrency-mode is dedicated. Setting the value to enabled is intended to aid in debugging a plugin and not overrun /var/log/ltn with debug logs. The default value is disabled.

log-publisher

Specifies the log destination for messages generated by the ILXLogger nodejs object in an extension. See sys log-config publisher.

node-version

Display the Node.js version that is used to run the plugin.

max-restarts

Specifies the maximum number of times an extension process may fail before the system will no longer automatically restart the process. See also restart-interval. The default value is 5.

restart-interval

Specifies the interval, in seconds, over which max-restarts

may occur. The default value is 60 seconds.

trace-level

Specifies the global trace level for an extension. This can also be controlled by an extension using the Javascript function `ILXPlugin.setGlobalTraceLevel` (note that this does not update the extension configuration, only the running extension). An extension may use this setting in Javascript by calling `ILXPlugin.globalTraceLevel()`. F5 extension internals also use this setting to log interaction between the configuration system, the TMM and the plugin extension. A value of zero will stop trace logging. A value of 1 will log configuration messages. A value of 10 will log general function call location information. A value of 20 will include function call information in the packet path. A value of 30 will include packet content that is sent and received to and from the TMM. Note that if the trace level has been set by Javascript code in the plugin using `ILXPlugin.setGlobalTraceLevel` and the extension trace-level setting is zero then to disable tracing in the plugin you must update the plugin code. See also `ilx-logging`.

from-workspace

Create or modify a plugin using the set of files in the specified workspace. The workspace files are copied into a system are. New node process are started using the latest copy of workspace files. Existing node processes continue to run until all tmm connections associated with those processes have closed.

log-publisher

Specifies the log destination for messages generated by the `ILXLogger` nodejs object without an extension level `log-publisher`. See `sys log-config publisher`.

`name` Specifies a unique name for the component. This option is required for the commands `create` and `modify`.

staged-directory

Display the workspace directory that was used to create the plugin.

Debugging

In order to debug an ILX extension the user must enable debugging via command-options and restart the plugin. Node.js provides three options for enabling remote debugging: `--debug[=]`, `--debug-port=` and `--debug-brk=`.

If a debug port is specified the system will search for an available port starting with the specified port. Please note that the debugging can only be enabled in single concurrency mode.

```
modify ilx plugin my_plugin extension { my_extension { command_options add { --debug } } }
restart ilx plugin my_plugin
```

If a debug port is not specified with either `--debug=`, `--debug-brk=` or `--debug-port=`, the system will search for an available port within the configured `debug-port-range-low` and `debug-port-range-high` range. If a port is specified the system will perform a search for an available port using the specified port instead of the `debug-port-range-low` value. The assignment of the specified port is best-effort and is not guaranteed. In both cases the search for ports is consecutive.

There is a system-wide list of ports that will be skipped during the debug port search:

Eg.

```
# list ilx global-settings
ilx global-settings {
  debug-port-blacklist { 47019 54321 60000 }
}
```

The `node-inspector` process must be started at the bash command line, specifying a valid IP address that is either a `self-ip` (net `self-ip`) or the management IP address (`sys management-ip`).

```
/usr/local/node/v6/lib/node_modules/.bin/node-inspector --web-host --no-inject
```

It will then be possible to connect to the IP address using the port that the system chose. The debug port that the system chose can be seen by running the command `show plugin my_plugin`.

```
show plugin my_plugin extensions { my_extension }
```

```
...
```

```
| Extension Process: my_extension
```

```
-----
| Status      running
| PID         1190
| TMM         0
| CPU Utilization (%) 0
| Debug Port  20000
| Memory (bytes)
| Total Virtual Size 0
| Resident Set Size 0
| RPC Info
|
|-----
|
```

```
...
```

It is then possible to connect with a suitable debugging client, such as the Chrome(tm) browser via:
`https://:8080/debug?port=20000`

The externally reachable port opened by `node-inspector` is `":8080"`. Port `"20000"` is the port displayed by the `show ilx plugin` command.

Statistics

Provided the ILX-RPC and ILX Streaming can be used simultaneously there are designated sections for each in the stats.

The plugin statistics are reset every time the plugin is restarted. Additionally the statistics can be reset from the tmsh (see EXAMPLES above).

The output looks like the following:

```
-----
ILX::Plugin: my_plugin
-----
State enabled
Log Publisher local-db-publisher

-----
| Extension: my_extension
-----
| Status running
| CPU Utilization (%) 0
| Memory (bytes)
| Total Virtual Size 0
| Resident Set Size 0
| RPC Info - ILX-RPC Specific information
| RPC Connections
| Active 0 - active RPC connections
| Total 0 - total RPC connections (ILX::init calls)
| Total Calls 0 - total RPC calls (ILX::call calls)
| Notifies 0
| Timeouts 0 - number of expired connections
| Errors 0 - number of connection errors
| Octets In 0 - number of octets received
| Octets Out 0 - number of octets sent
| Average Latency 0 - average time that it takes node to respond to an iRule ILX::call
| Max Latency 0 - max response time it took node to respond to an iRule ILX::call
| Streaming Info - ILX Streaming specific information
| Flow Connections - virtual server initiated connections.
| Clientside
| Active 0 - active clientside connections
| Total 0 - total connections
| Serverside
| Active 0 - active serverside connections
| Total 0 - total connections
| Sideband Connections - connections initiated with .connect() call
| Active 0 - active connections
| Total 0 - total connections
| Aborts 0 - number of aborted connections
| Timeouts 0 - number of expired connections
| Errors 0 - number of connection errors
| Octets In 0 - number of octets received
| Octets Out 0 - number of octets sent
| Table Calls 0 - number of API calls to SessionDB (ILXTable)
| Datagroup Calls 0 - number of API calls to Datagroups (ILXDatagroup)
| Restarts 0 - number of plugin restarts
| Failures 0 - number of plugin failures
```

```
-----
| Extension Process: my_extension
-----
```

```
| Status running
| PID 20626
| TMM 0
| CPU Utilization (%) 0
| Debug Port 20001
| Memory (bytes)
| Total Virtual Size 735.6M
| Resident Set Size 15.2K
| RPC Info
| MPI channel mem://ilx:1:0 - communication channel between node.js process and TMM
| RPC Connections
| ...
| Process specific fields for ILX-RPC similar to those in the Extension output
| ...
| Streaming Info
| MPI channel mem://ilx:2:0 - communication channel between node.js process and TMM
| Flow Connections
| ...
| Process specific fields for ILX-Streaming similar to those in the Extension output
| ...
```

```
-----
| Extension Process: my_extension
-----
```

```
| Status running
| PID 20627
| TMM 1
| CPU Utilization (%) 0
| ...
```

For ILX-Streaming, more information is available from the ILX profile statistics.

BIG-IP 2017-04-06 ilx plugin(1)

ilx workspace

NAME
workspace - Configures a development workspace for Node.js(tm) iRule Language Extensions.

MODULE
ilx

SYNTAX
Configure the workspace component within the ilx module using the syntax shown in the following sections.

CREATE/MODIFY/EDIT
create workspace [name]
options:
archive [name]
extension [name]
file [name]
from-archive [name]
from-plugin [name]
from-uri [uri]
from-workspace [name]
node-version [version]
rule [name]

modify workspace [name]
options:
from-archive [name]
from-plugin [name]
from-uri [uri]
from-workspace [name]
node-version [version]

edit workspace [name]
options:
extension [name]
file [name]
rule [name]

DISPLAY
list workspace
list workspace [[name] ...]
show running-config workspace
show running-config workspace [[name] ...]

field-fmt

DELETE
delete workspace [name]
options:
archive [name]
extension [name]
file [name]
rule [name]

DESCRIPTION
An ILX Workspace is an area of the file system used to store Node.js(tm) and supporting files used to construct an ilx plugin. Workspaces are stored in /var/ilx/workspaces/.../.

A workspace contains several components.
/var/ilx/workspaces/Common/extensions/...
/var/ilx/workspaces/Common/rules/...
/var/ilx/workspaces/Common/version

The extensions directory contains sub-directories. Each sub-directory contains files for a specific extension.

`/var/ilx/workspaces/Common//extensions//...` Each extension directory must contain a `package.json` file. This is a standard npm package definition file. For more information see www.npmjs.org/doc/package.json.html. When an ilx plugin is started node will look in `package.json` for a `main` field that identifies the main entry point of the plugin. If the `main` field is not present node will look for the file `index.js`.

The `rules` directory contains zero or more files that contain `iRules` (see `ltm rule`).

`/var/ilx/workspaces/Common//rules/.tcl`.

ILX `iRule` commands are used to communicate with a Node.js(tm) process that is running as part of an ILX Plugin. When a new rule is created using either of the following commands a sample `iRule` file is opened with syntax examples for the ILX `iRule` commands.

```
create ilx workspace ilx rule test
edit ilx workspace ilx rule test
```

When a new extension is created using the following commands a sample `index.js` file will be created that contains Node.js(tm) and ILX `iRule` examples. The extension directory is also populated with the file `package.json` and locally installed Node.js(tm) modules.

```
tmsh create ilx workspace my_workspace
tmsh create ilx workspace my_workspace extension my_extension
```

The version file indicates the BIG-IP version used to create the workspace.

EXAMPLES

```
create workspace my_workspace
```

Creates a workspace named `my_workspace` in `/var/ilx/workspaces/Common/my_workspace` (assuming your current working folder is the default BIG-IP folder `/Common`).

```
create workspace my_workspace rule my_rule
```

Adds the `iRule` `my_rule` as the file `my_rule.tcl` to the workspace directory named `/var/ilx/workspaces/Common/my_workspace/rules/`.

```
edit workspace my_workspace rule my_rule
```

Adds or modifies the `iRule` `my_rule` as the file `my_rule.tcl` to the workspace directory named `/var/ilx/workspaces/Common/my_workspace/rules/`.

```
create workspace my_workspace extension my_extension
```

Adds a new extension directory in `/var/ilx/workspaces/Common/my_workspace/extensions/my_extension` and installs `node_modules/f5-nodejs` within the directory. `my_extension` must be a valid Linux directory name.

```
edit workspace my_workspace extension my_extension
```

If the extension does not exist a new extension directory is created in `/var/ilx/workspaces/Common/my_workspace/extensions/my_extension`, installs `node_modules/f5-nodejs` within the directory and opens the editor on the file within the directory named `index.js`. If the extension already exists the editor will open `index.js`.

```
edit workspace my_workspace file extensions/my_extension/my_file.js
```

If the extension does not exist a new extension directory is created in `/var/ilx/workspaces/Common/my_workspace/extensions/my_extension`, installs `node_modules/f5-nodejs` within the directory and opens the editor on `my_file.js`. If the extension already exists the editor will open `my_file.js`.

```
edit workspace my_workspace file extensions/my_extension/my_file.js
```

The editor is opened on `/var/ilx/workspaces/Common/my_workspace/extensions/my_extension/my_file.js`. The extension must already exist.

```
delete workspace my_workspace
```

Deletes the workspace named `my_workspace`. This removes all disk files associated with the workspace and cannot be undone. You will be prompted to confirm before the workspace is deleted.

```
delete workspace my_workspace extension my_extension
```

Deletes the extension named `my_extension` in `my_workspace`.

```
delete workspace my_workspace rule my_rule
```

Deletes the `iRule` file named `my_rule` in `my_extension` in `my_workspace`.

```
delete workspace my_workspace file extensions/my_extension/my_file
```

Deletes the file named `my_file` in `my_extension` in `my_workspace`.

```
list workspace my_workspace
```

List the content of `my_workspace`

```
list workspace recursive my_workspace
```

List all files and directories in `my_workspace`.

```
list workspace my_workspace rule
```

List the rules associated with `my_workspace`.

```
list workspace my_workspace rule my_rule

List the text content of the rule my_rule associated with my_workspace

list workspace my_workspace file rules/my_rule.tcl

List the text content of the file rules/my_rule.tcl associated with
my_workspace

list workspace my_workspace extension

List the extensions associated with my_workspace.

list workspace my_workspace extension my_extension

List the content of the my_extension extension directory associated
with my_workspace.

list workspace my_workspace file extensions/my_extension/my_file

List the text content of the file my_file in extension my_extension.

show workspace my_workspace

Show the top level files for the specified workspace. Show the group,
last modify time, owner, permissions and size of the workspace.

show workspace

Show all workspaces.
```

OPTIONS

```
archive
Specifies the name of a workspace archive file. See the section
below on archives.

all-files
Recursively list all directory and file names contained in a
workspace.

all-properties
For a show command, show group, last modify time, owner,
permissions, type and size of the file/directory.

detail
For a show command, show all the files in the workspace.

extension
Specifies the name of a workspace extension.

file
For the edit and list commands the file option specifies the name
of a file in a workspace to edit or list. For the delete command
the file option specifies the name of a workspace file to delete.

from-archive
Specifies the name of a tar or gzipped tar archive file from which
to create or update a workspace. See the section below on
archives.

from-plugin
Specifies the name of an ilx plugin from which to create or modify
a workspace. The files used to create the plugin are copied into
the workspace.

from-uri
Specifies the name of a URI from which to create or update a
workspace. The URI must refer to a tar or gzipped tar archive
file.

from-workspace
Specifies the name of a workspace from which to create or modify a
workspace. The files used to create the workspace specified by
from-workspace are copied into the new workspace.

node-version
Specifies the version of Node.js that will be used to run an . When an is created or updated from a
workspace the plugin inherits the node-version from the workspace.
The node-version may be specified when an ilx workspace is
created. The node-version may also be changed after the ilx
workspace has been created.
```

When the node-version of a workspace is changed the workspace is archived. The following files and directories are replaced: The file

```
[workspace name]/extensions/[extension
name]/node_modules/f5-nodejs/package.json
```

and the content of the directory

```
[workspace name]/extensions/[extension
name]/node_modules/f5-nodejs/lib.
```

To update an existing ilx plugin to use the new workspace version issue the following command:

```
modify ilx plugin [plugin name] from-workspace [workspace name]
```

When a node process is started the BigIP sets the NODE_PATH environment variable. For Node.js version 0.12 plugins the NODE_PATH is set to /usr/local/node/v0.12/lib/node_modules. For Node.js version 6 the NODE_PATH is set to /usr/lib/node_modules:/usr/local/node/v6/lib/node_modules.

one-line
List the content of a workspace on a single line.

recursive
Recursively list all workspaces contained in the current BIG-IP system folder (see sys folder).

rule Specifies the name of a rule file to create, delete, edit or list.

staged-directory
The directory where the workspace and associated files reside. This is a read-only property.

name Specifies the name of a workspace. This option is required for the commands create, delete, edit and modify.

ACCESS CONTROL

Workspaces are stored under file system directory /var/ilx/workspaces.

A user with the role of admin can access all workspaces under /var/ilx/workspaces.

Users with the role of irule-manager, manager and resource-admin can manage workspaces under /var/ilx/workspaces/, where is the name of an existing sys folder that the user has permission to access, see also help sys folder and help pwd.

As a convenience workspaces are automatically created in the users' current folder relative to /var/ilx/workspaces. However, workspaces may be created in file system directories that do not correspond to BIG-IP system configuration folders. In this case the workspace must be referred to by full path.

The following creates two workspaces, the first in the file system location /var/ilx/workspaces/Common/my_workspace and the second in the filesystem location /var/ilx/workspaces/Common/my_folder/my_workspace.

```
(tmos)# pwd
/Common
(tmos)# create ilx workspace my_workspace
(tmos)# cd my_folder
(tmos)# pwd
/Common/my_folder
(tmos)# create ilx workspace my_workspace_2
(tmos)# list ilx workspace my_workspace_2

(tmos)# cd ..
(tmos)# pwd
/Common
(tmos)# list ilx workspace my_workspace
```

Full folder paths may be used to refer to a workspace.

```
(tmos)# create ilx workspace /Common/my_folder/my_workspace_2
(tmos)# list ilx workspace /Common/my_folder/my_workspace_2
```

If an auth partition is removed from the BIG-IP configuration the workspace files remain on disk and can be accessed by a user with the role of admin. If a sys folder is removed under an auth partition, such as removing the folder /Common/my_config, all workspaces under the file system directory /var/ilx/workspaces/Common/my_config remain accessible to all users that have access to the Common partition.

ARCHIVES

A workspace archive is a gzipped tar file of an existing workspace. The archive contains all files in the workspace.

There are two ways to refer to an archive: 1) 2) //.

Workspace archives are stored in /var/ilx/workspaces//archive/. The system looks for archives in /var/ilx/workspaces//archive.

If an auth partition is removed from the BIG-IP configuration, archive files remain on disk and can be accessed by a user with the role of admin. A user with the role of admin can also manage archives under /var/ilx/workspaces in directories that do not correspond to a BIG-IP auth partition.

```
create workspace my_workspace archive my_workspace.tgz
```

Save the workspace as a gzipped tar file. The workspace must have been previously created.

```
create workspace my_workspace archive /my_partition/my_workspace.tgz
```

Save the workspace as a gzipped tar file to the set of archives in /my_partition. The workspace must have been previously created.

```
list workspace my_workspace archive
```

List all archives in the current auth partition.

```
list workspace my_workspace archive my_workspace.tgz
```

List file details for the archive my_workspace.tgz.

```
list workspace my_workspace archive /my_partition/my_workspace.tgz
```

List file details for the archive my_workspace.tgz that is in my_partition.

```
list workspace my_workspace archive /my_partition
```

```
List all archives in /my_partition.
delete workspace archive my_archive.tgz
Delete the workspace archive my_archive.tgz.
delete workspace archive /my_partition/my_archive.tgz
Delete the workspace archive my_archive.tgz in /my_partition.
create workspace my_workspace from-archive my_workspace.tgz
Create a new workspace from the archive my_workspace.tgz.
modify workspace my_workspace from-archive my_workspace.tgz
Update my_workspace from the archive my_workspace.tgz.
```

CONFIGURATION FILES

Workspaces are not stored in system config files.

Workspaces are stored in UCS files and are rolled forward to the next product release.

In a bladed system workspaces are clustered among blades.

Workspaces are not synced across device groups.

DELETE
delete alg-log-profile [name | all]

DESCRIPTION
  A ALG log profile allows fine grain control of the logging for ALG
  events. When attached to an supported ALG profile - currently FTP,
  RTSP, SIP, you can control the events to log as well as optional
  elements in the log entry.

EXAMPLES
  create ltm alg-log-profile my_alg_log_profile end-control-channel {
  action backup-allocation-only } end-data-channel { action backup-
  allocation-only }

  Creates the ALG log profile my_alg_log_profile that generates log
  entries for both inbound and data-channel when translation is from
  backup members only.

  delete alg-log-profile my_lsn_log_profile

  Deletes the ALG log profile named my_lsn_log_profile.

OPTIONS
  app-service
  Specifies the name of the application service to which this object
  belongs. The default value is none.

  Note: If the strict-updates option is enabled on the application
  service that owns the object, you cannot modify or delete this
  object. Only the application service can modify or delete this
  object.

  csv-format
  When enabled, use CSV log format for log entries. The default
  value is disabled.

  events
  The type of ALG events available for logging control.

  start-control-channel
  Event for start of control channel connection.

  end-control-channel
  Event for end of control channel connection.

  start-data-channel
  Event for start of data channel connection.

  end-data-channel
  Event for end of data channel connection.

  inbound-transaction
  Event for inbound transaction event to an ALG end-point.
  Inbound transaction log entry could contain both incoming and
  outgoing messages.

  action
  Specify the logging action to be taken when a particular event is
  encountered.

  enabled
  Logging is enable for the event, regardless of how the flow
  is created.

  backup-allocation-only
  Logging is enable for the event, when the ALG is proxy with a
  LSN, and translation is take from backup pool member only.

  disabled
  Logging is disable for the event.

  elements
  Optional elements that can be added to the log message.

  regex
  Displays the items that match the regular expression. The regular
  expression must be preceded by an at sign (@[regular expression])
  to indicate that the identifier is a regular expression. See help
  regex for a description of regular expression syntax.

ltm auth crldp-server

NAME
crldp-server - Creates a Certificate Revocation List Distribution Point (CRLDAP) server for implementing a CRLDP authentication module.

MODULE
ltm auth

SYNTAX
Configure the crldp-server component within the ltm auth module using the syntax in the following sections.

CREATE/MODIFY
create crldp-server [name]
modify crldp-server [name]
options:
 app-service [[string] | none]
 base-dn [[LDAP base directory name] | none]
 description [string]
 host [[ip address] | none]
 port [[name] | [number]]
 reverse-dn [disabled | enabled]

edit crldp-server [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list crldp-server
list crldp-server [[[name] | [glob] | [regex]] ...]
show running-config crldp-server
show running-config crldp-server [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete crldp-server [name]

DESCRIPTION
CRLDP authentication is a mechanism for checking certificate revocation status for client connections passing through the BIG-IP(r) system. This module is useful when your authentication data is stored on a remote CRLDP server.

To implement a CRLDP authentication module and create a CRLDP server:

1. Use the crldp-server component in the ltm auth module to create a CRLDP server.
2. Use the ssl-crldp component in the ltm auth module to configure a CRLDP configuration object and associate it with the server you created in Step 1.
3. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the SSL CRLDP configuration object that you created in Step 2.
 - b. For the defaults-from option, specify a parent profile (either the default profile named ssl_crldp or another custom profile that you created).

EXAMPLES
create crldp-server my_crldp_server

Creates a CRLDP server named my_crldp_server.

delete crldp-server my_crldp_server

Deletes a CRLDP server named my_crldp_server.

OPTIONS
app-service
Specifies the name of the application service to which the CRLDP server belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the CRLDP server. Only the application service can modify or delete the CRLDP server.

base-dn
Specifies the LDAP base directory name for certificates that

specify the CRL distribution point in directory name format (dirName). The default value is none.

Use this option when the value of the X509v3 attribute crlDistributionPoints is of type dirName. In this case, the BIG-IP system attempts to match the value of the crlDistributionPoints attribute to the value of the base-dn option. An example of a base-dn value is cn=lxxx,dc=f5,dc=com.

description
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

host Specifies an IP address for the CRLDP server. This option is required. The default value is none.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition within which the component resides.

port Specifies the port for CRLDP authentication traffic. The default value is 389.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

reverse-dn
Specifies in which order the system attempts to match the value of the base-dn option to the value of the X509v3 attribute crlDistributionPoints. When enabled, the system matches the value of the base-dn option from left to right, or from the beginning of the DN string, to accommodate dirName strings in certificates such as C=US,ST=WA,L=SEA,OU=F5,CN=xxx. The default value is disabled.

ltm auth kerberos-delegation

NAME
kerberos-delegation - Configures a Kerberos delegation profile.

MODULE
ltm auth

SYNTAX
Configure the kerberos-delegation component within the ltm auth module using the syntax shown in the following sections.

CREATE/MODIFY
create kerberos-delegation [name]
modify kerberos-delegation [name]
options:
app-service [[string] | none]
client-principal [string]
debug-logging [disabled | enabled]
description [string]
protocol-transition [disabled | enabled]
server-principal [string]

edit kerberos-delegation [[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

reset-stats kerberos-delegation
reset-stats kerberos-delegation
[[name] | [glob] | [regex]] ...]

DISPLAY
list kerberos-delegation

```
list kerberos-delegation [ [ [name] | [glob] | [regex] ] ... ]
show running-config kerberos-delegation
show running-config kerberos-delegation
  [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show kerberos-delegation
show kerberos-delegation [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete kerberos-delegation [name]
```

DESCRIPTION

The Kerberos delegation configuration acts like a proxy for Kerberos credentials. When connecting to a server that is inside its domain, the browser client fetches Kerberos credentials known as delegated credentials. These credentials are passed on to the system. Once the system has these credentials, it retrieves credentials for the RealServer(r) that is on the back end, and passes those credentials back.

Each user is assigned a unique cookie that describes a session on the system. This cookie is encrypted in a cookie key.

To configure a Kerberos authentication module and create a Kerberos configuration object:

1. Use the kerberos-delegation component in the ltm auth module to create a Kerberos configuration object.
2. Use the profile component, in the ltm auth module, to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the Kerberos configuration object that you created in Step 1.
 - b. For the defaults-from option, specify a parent profile (either the default Kerberos profile named krbdelegate or another custom Kerberos profile that you created).

EXAMPLES

```
create kerberos-delegation my_kerberos-delegation_config client-
principal client.net server-principal server.net
```

Creates a Kerberos delegation profile named my_kerberos-delegation_config.

```
list kerberos-delegation all-properties
```

Displays all properties for all Kerberos delegation profiles.

OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

client-principal

Specifies the principal that the client sees. This is usually a value such as HTTP/. This principal may be in a different domain from the server principal. This option is required. There is no default value.

debug-logging

Specifies whether the system logs debugging actions. The default value is disabled.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which this profile resides.

protocol-transition

Specifies whether associated virtual should transition client certificate authentication into Kerberos credentials.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

server-principal

Specifies the principal of the back-end web server. This is usually a value such as HTTP/. This may be in a different domain from the server principal. This setting is required. There is no default value.

list ldap [ [ [name] | [glob] | [regex] ] ... ]
show running-config ldap
show running-config ldap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete ldap [name]
```

DESCRIPTION

LDAP authentication is a mechanism for authenticating or authorizing
client connections passing through the system. LDAP authentication is
useful when your authentication or authorization data is stored on a
remote LDAP server or a Microsoft(r) Windows Active Directory(r)
server, and you want the client credentials to be based on basic HTTP
authentication (that is, user name and password).

To configure an LDAP authentication module and create an LDAP

configuration object:

1. Use the ldap component in the ltm auth module to create an LDAP configuration object.
2. Use the profile component, in the ltm auth module, to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the LDAP configuration object that you created in Step 1.
 - b. For the defaults-from option, specify a parent profile (either the default LDAP profile named ldap or another custom profile that you created).

EXAMPLES

```
create ldap my_auth_ldap servers add {my_ldap_auth_server}
```

Creates a configuration object named my_auth_ldap

```
delete ldap my_auth_ldap
```

Deletes the configuration object named my_auth_ldap.

OPTIONS

bind-dn

Specifies the distinguished name of an account to which to bind, to perform searches. This search account is a Read-only account used to do searches. You can use the admin account as the search account. If no admin DN is specified, then no bind is attempted. The default value is none.

This option is required only when a site does not allow anonymous searches. If the remote server is a Microsoft(r) Windows(r) Active Directory(r) server, the distinguished name must be in the form of an email address.

bind-pw

Specifies the password for the search account created on the LDAP server. This option is required if you specify a value for the bind-dn option. The default value is none.

bind-timeout

Specifies a bind timeout limit. The default value is 30 seconds.

check-host-attr

Confirms the password for the bind distinguished name. This option is optional. The default value is disabled.

debug

Enables or disables syslog-ng debugging information at LOG DEBUG level. The default value is disabled. F5 Networks does not recommend using this option for normal configuration.

description

User defined description.

filter

Specifies a filter. Use this option for authorizing client traffic. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

group-dn

Specifies the group distinguished name. The system uses this option for authorizing client traffic. The default value is none.

group-member-attribute

Specifies a group member attribute. The system uses this option for authorizing client traffic. The default value is none.

idle-timeout

Specifies the idle timeout, in seconds, for connections. The default value is 3600 seconds.

ignore-auth-info-unavail

Specifies whether the system ignores authentication information, if it is not available. The default value is no.

ignore-unknown-user

Specifies whether the system ignores a user that is unknown. The default value is disabled.

login-attribute

Specifies a logon attribute. Normally, the value for this option is uid; however, if the server is a Microsoft Windows Active Directory server, the value must be the account name samaccountname (not case-sensitive). The default value is none.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

port Specifies the port number or name for the LDAP service. Port 389 is typically used for non-SSL and port 636 is used for an SSL-enabled LDAP service. The default value is ldap.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

scope
Specifies the search scope. The default value is sub. The options are:

base Specifies the search scope is base object. The base value is almost never useful for nameservice lookups.

one Specifies the search scope is one level.

sub Specifies the search scope is subtree.

search-base-dn
Specifies the search base distinguished name. The default value is none.

search-timeout
Specifies the search timeout. The default value is 30 seconds.

servers
Specifies the LDAP servers that the system must use to obtain authentication information. You must specify a server when you create an LDAP configuration object.

ssl Enables or disables SSL functionality. The default is disabled.

Note that when you use the command line interface to enable SSL for an LDAP service, the system does not change the service port number from 389 to 636, as is required. To change the port number from the command line, use the service option of this command (see above), for example, ldap [name] ssl enabled service 636.

ssl-ca-cert-file
Specifies the name of an SSL CA certificate using the full path to the file. The default value is none.

ssl-check-peer
Specifies whether the system checks an SSL peer. The default value is disabled.

ssl-ciphers
Specifies SSL ciphers. The default value is none.

ssl-client-cert
Specifies the name of an SSL client certificate. The default value is none.

ssl-client-key
Specifies the name of an SSL client key. The default value is none.

user-template
Specifies a user template for the LDAP application to use for authentication. The default value is none.

version
Specifies the version number of the LDAP application. The default value is 3.

warnings
Enables or disables warning messages. The default value is enabled.

DELETE
delete ocsf-responder [name]

```

DESCRIPTION

To implement the SSL OCSF authentication module, you must create the following objects: one or more OCSF responder objects, an SSL OCSF configuration object, and an SSL OCSF profile.

To implement an SSL OCSF authentication module and create an OCSF responder object:

1. Use the ocsf-responder component in the ltm auth module to configure an OCSF responder object.
2. Use the ssl-ocsf component in the ltm auth module to configure an SSL OCSF configuration object to which you add the OCSF responder object that you created in Step 1.
3. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the SSL OCSF configuration object that you created in Step 2.
 - b. For the defaults-from option, specify a parent profile (either the default OCSF Responder profile named ssl_ocsf or another custom profile that you created).

OPTIONS

allow-certs

Enables or disables the addition of certificates to an OCSF request. The default value is enabled.

app-service

Specifies the name of the application service to which the OCSF responder object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the OCSF responder object. Only the application service can modify or delete the OCSF responder object.

ca-file

Specifies the name of the file containing trusted CA certificates used to verify the signature on the OCSF response. The default value is none.

ca-path

Specifies the name of the path containing trusted CA certificates used to verify the signature on the OCSF response. The default value is none.

cert-id-digest

Specifies a specific algorithm identifier, either sha1 or md5. The default value is sha1. The options are:

sha1 is newer and provides more security with a 160-bit hash length.

md5 is older and has only a 128-bit hash length.

The cert ID is part of the OCSF protocol. The OCSF client (in this case, the BIG-IP system) calculates the cert ID using a hash of

the Issuer and serial number for the certificate that it is trying to verify.

chain

Specifies whether the system constructs a chain from certificates in the OCSF response. The default value is enabled.

check-certs

Enables or disables verification of an OCSF response certificate. Use this option for debugging purposes only. The default value is enabled.

description

User defined description.

explicit

Specifies that the Local Traffic Manager explicitly trusts that the OCSF response signer's certificate is authorized for OCSF response signing. If the signer's certificate does not contain the OCSF signing extension, specification of this option causes a response to be untrusted. The default value is enabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-aia

Specifies whether the system ignores the URL contained in the certificate's AIA fields, and always uses the URL specified by the responder instead. The default value is disabled.

intern

Specifies whether the system ignores certificates contained in an OCSF response when searching for the signer's certificate. To use this option, the signer's certificate must be specified with either the verify-other or va-file option. The default value is enabled.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nonce

Specifies whether the system verifies an OCSF response signature or the nonce values. The default value is enabled.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

sign-digest

Specifies the algorithm for signing the request, using the signing certificate and key. This parameter has no meaning, if request signing is not in effect (that is, both the request signing certificate and request signing key parameters are empty). This parameter is required only when request signing is in effect. The default value is sha1.

sign-key

Specifies the key that the system uses to sign an OCSF request. The default value is none.

sign-key-pass-phrase

Specifies the passphrase that the system uses to encrypt the sign key. The default value is none.

sign-other

Adds a list of additional certificates to an OCSF request. The default value is none.

signer

Specifies a certificate used to sign an OCSF request. If the certificate is specified, but the key is not specified, then the private key is read from the same file as the certificate. If neither the certificate nor the key is specified, then the request is not signed. If the certificate is not specified and the key is specified, then the configuration is considered to be invalid. The default value is none.

status-age

Specifies the age of the status of the OCSF responder. The default value is 0 (zero).

trust-other

Instructs the BIG-IP local traffic management system to trust the certificates specified with the verify-other option. The default is value disabled.

url Specifies the URL used to contact the OCSF service on the responder. This option is required. The default value is none.

va-file

Specifies the name of the file containing explicitly trusted responder certificates. This parameter is needed in the event that the responder is not covered by the certificates already loaded into the responder's CA store. The default value is none.

validity period

Specifies the number of seconds used to specify an acceptable error range. Use this option when the OCSF responder clock and a

client clock are not synchronized, which can cause a certificate status check to fail. This value must be a positive number. The default value is 300 seconds.

verify

Enables or disables verification of an OCSP response signature or the nonce values. Used for debugging purposes only. The default value is enabled.

verify-cert

Specifies that the system makes additional checks to see if the signer's certificate is authorized to provide the necessary status information. Use this option for testing purposes only. The default value is enabled.

verify-other

Specifies the name of the file used to search for an OCSP response signing certificate when the certificate has been omitted from the response. The default value is none.

verify-sig

Specifies that the system checks the signature on the OCSP response. Use this option for testing purposes only. The default value is enabled.

ltm auth profile

NAME

profile - Configures an authentication profile.

MODULE

ltm auth

SYNTAX

Configure the profile component within the ltm auth module using the syntax shown in the following sections.

CREATE/MODIFY

create profile [name]

modify profile [name]

options:

app-service [[string] | none]
configuration [[name] | none]
cookie-key [string]
cookie-name [string]
credential-source [http-basic-auth]
defaults-from [name]
description [string]
enabled [yes | no]
idle-timeout [integer]
rule [iRule name]

edit profile [[name] | [glob] | [regex]] ...]

options:

all-properties
non-default-properties

reset-stats profile

reset-stats profile [[name] | [glob] | [regex]] ...]

DISPLAY

list profile

list profile [[name] | [glob] | [regex]] ...]

show running-config profile

show running-config profile [[name] | [glob] | [regex]] ...]

options:

all-properties
non-default-properties
one-line
partition

show profile

show profile [[name] | [glob] | [regex]] ...]

options:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

field-fmt
global

DELETE
delete profile [name]

Note: You cannot delete default profiles.

DESCRIPTION

You can use the profile component to configure a custom authentication profile, or you can use the default profile that the BIG-IP(r) Local Traffic Manager system provides for each type of authentication module.

An authentication profile requires one of the following configuration objects: ltm auth kerberos-delegation, ltm auth ldap, ltm auth radius, ltm auth ssl-cc-ldap, ltm auth ssl-crl dp, ltm auth ssl-ocsp or ltm auth tacacs. The type of profile specified by the defaults-from option must match the type of configuration object.

EXAMPLES

```
create profile my_authentication_profile { configuration tacacs
defaults-from tacacs credential-source http-basic-auth enabled yes
idle-timeout 30 rule _sys_auth_tacacs }
```

Creates a profile named my_authentication_profile for TACACS+ authentication.

```
list profile
```

Displays the properties of all of the auth profile components.

OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

configuration

Specifies the name of an authentication configuration object. This option is required.

cookie-key

Specifies the key that the system uses to encrypt the session cookie assigned to each user using the cookie-name option. The default value is f5auth. This option applies only to KRB Delegate profiles.

cookie-name

Specifies a session cookie that the system assigns to each user. F5 Networks recommends that each virtual server use a different cookie name. The system encrypts the cookie using the value of the cookie-key option. The default value is abc123. This option applies only to KRB Delegate profiles.

credential-source

Specifies the credential source.

defaults-from

Specifies the name of the authentication profile from which you want your custom profile to inherit settings. This option is required.

description

User defined description.

enabled

Specifies whether this authentication profile is enabled. The default value is yes.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

idle-timeout

Specifies the idle timeout for the authentication profile. The default value is 300 seconds.

name

Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rule

Specifies the name of the rule that corresponds to the authentication method you want to use.

SEE ALSO

BIG-IP 2016-03-14 ltm auth profile(1)

ltm auth radius-server

NAME

radius-server - Configures a RADIUS server for implementing remote RADIUS-based client authentication.

MODULE

ltm auth

SYNTAX

Configure the radius-server component within the ltm auth module using the syntax shown in the following sections.

CREATE/MODIFY

```
create radius-server [name]
modify radius-server [name]
options:
  description [string]
  port [ [name] | [number] ]
  secret [none | ["string" ] ]
  server [ [hostname] | [ip address] | none ]
  timeout [integer]
```

```
edit radius-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list radius-server
list radius-server [ [ [name] | [glob] | [regex] ] ... ]
show running-config radius-server
show running-config radius-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete radius-server [name]
```

DESCRIPTION

You use a RADIUS authentication module when your authentication data is stored on a remote RADIUS server. In this case, client credentials are based on basic HTTP authentication (that is, user name and password).

To configure a RADIUS authentication module and create a RADIUS server:

1. Use the radius-server component in the ltm auth module to configure a RADIUS server.
2. Use the radius component in the ltm auth module to create a RADIUS configuration object that references the RADIUS server you created in Step 1.
3. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the radius component that you created in Step 2.
 - b. For the defaults-from option, specify a parent profile (either the default RADIUS profile named radius or another custom profile that you created).

EXAMPLES

```
create radius-server bigip_auth_radius_server secret "This is the secret." server 10.1.1.1
```

Creates a RADIUS server named my_radius_server.

```
delete radius-server my_radius_server
```

Deletes the RADIUS server named my_radius_server.

OPTIONS

description
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition
Displays the administrative partition in which the component resides.

port Specifies the port for RADIUS authentication traffic. The default value is 1812.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret
Specifies the secret key the system uses to encrypt and decrypt packets sent or received from the server. This option is required.

server
Specifies the host name or IP address of the RADIUS server. This option is required.

timeout
Specifies the timeout value. The default value is 3 seconds.

SEE ALSO

create, delete, edit, glob, list, ltm auth profile, ltm auth radius, ltm virtual, modify, regex, show, tmsh

list radius

list radius [[[name] | [glob] | [regex]] ...]

show running-config radius

show running-config radius [[[name] | [glob] | [regex]] ...]

options:

all-properties

non-default-properties

one-line

partition

DELETE

delete radius [name]

DESCRIPTION

You use a RADIUS authentication module when your authentication data is stored on a remote RADIUS server. In this case, client credentials are

based on basic HTTP authentication (that is, username and password).

To implement a RADIUS authentication module and create a RADIUS configuration object:

1. Use the radius-server component in the ltm auth module to configure a RADIUS server.
2. Use the radius component in the ltm auth module to create a RADIUS configuration object that references the RADIUS server you created in Step 1.
3. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the RADIUS configuration object that you created in Step 2.
 - b. For the defaults-from option, specify a parent profile (either the default RADIUS profile named radius or another custom profile that you created).

EXAMPLES

```
create radius my_radius_auth servers add { myradiusserver }
```

Creates a RADIUS configuration object named my_radius_auth.

```
delete radius my_radius_auth
```

Deletes the RADIUS configuration object named my_radius_auth.

OPTIONS

accounting-bug

Enables or disables validation of the accounting response vector. This option is necessary only on older servers. The default value is disabled.

client-id

Sends a NAS-Identifier RADIUS attribute with string bar. If you do not specify a value for the client-id option, the system uses the pluggable authentication module (PAM) service type. You can disable this feature by specifying a blank client ID.

debug

Enables or disables syslog-ng debugging information at LOG DEBUG level. F5 Networks does not recommend this option for normal use. The default value is disabled.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

retries

Specifies the number of authentication retries that the Local Traffic Manager allows before authentication fails. The default value is 3.

service-type

Specifies the type of service used for the RADIUS server. The default is default, which behaves as authenticate-only.

servers

Specifies the hostnames or IP addresses of the RADIUS servers that the BIG-IP Local Traffic Manager uses to obtain authentication data.

SEE ALSO

create, delete, edit, glob, list, ltm auth profile, ltm auth radius-server, ltm virtual, modify, regex, show, tmsh

NAME
ssl-cc-ldap - Configures an SSL client certificate configuration object for remote SSL-based LDAP authorization for client traffic passing through the traffic management system.

MODULE
ltm auth

SYNTAX
Configure the ssl-cc-ldap component within the ltm auth module using the syntax shown in the following sections.

```
CREATE/MODIFY
create ssl-cc-ldap [name]
modify ssl-cc-ldap [name]
options:
  admin-dn [ [name] | none]
  admin-password [none | [password] ]
  cache-size [integer]
  cache-timeout [integer]
  certmap-base [none | [search base] ]
  certmap-key [ [name] | none]
  certmap-user-serial [no | yes]
  description [string]
  group-base [none | [search base] ]
  group-key [ [name] | none]
  group-member-key [ [name] | none]
  role-key [ [name] | none]
  search-type [cert | certmap | user]
  secure [no | yes]
  servers
    [add | delete | none | replace-all-with] {
[ip address ... ]
}
  user-base [none | [search base] ]
  user-class [ [class] | none]
  user-key [ [key] | none]
  valid-groups
    [add | delete | replace-all-with] {
[group ... ]
}
  valid-groups none
  valid-roles
    [add | delete | replace-all-with] {
[role ... ]
}
  valid-roles none

edit ssl-cc-ldap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list ssl-cc-ldap
list ssl-cc-ldap [ [ [name] | [glob] | [regex] ] ... ]
show running-config ssl-cc-ldap
show running-config ssl-cc-ldap
[ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete ssl-cc-ldap [name]
```

DESCRIPTION
You can use the ssl-cc-ldap component to configure SSL client certificate-based remote LDAP authorization for client traffic passing through the traffic management system.

To configure this type of authentication module and create a configuration object:

1. Use the ssl-cc-ldap component in the ltm auth module to create an SSL client certificate LDAP configuration object.
2. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the configuration object that you created in Step 1.
 - b. For the defaults-from option, specify a parent profile (either the default profile named ssl_cc_ldap or another custom profile that you created).

OPTIONS

admin-dn

Specifies the distinguished name of an account to which to bind to perform searches. This search account is a read-only account used to do searches. The admin account can also be used as the search account. If no admin DN is specified, then no bind is attempted.

This option is required only when an LDAP database does not allow anonymous searches. The default value is none.

admin-password

Specifies the password for the admin account. See admin-dn above. The default value is none.

cache-size

Specifies the maximum size, in bytes, allowed for the SSL session

cache. Setting this option to 0 (zero) disallows SSL session caching. The default value is 20000 bytes (20KB).

cache-timeout

Specifies the number of usable lifetime seconds of negotiable SSL session IDs. When this time expires, a client must negotiate a new session. The default value is 300 seconds.

certmap-base

Specifies the search base for the subtree used by the certmap search method. A typical search base is: ou=people,dc=company,dc=com. The default value is none.

certmap-key

Specifies the name of the certificate map that the certmap search method uses. This name is found in the LDAP database. The default value is none.

certmap-user-serial

Specifies whether the system uses the client certificate's subject or serial number (in conjunction with the certificate's issuer) when trying to match an entry in the certificate map subtree.

A value of yes uses the serial number. A value of no uses the subject. The default value is no.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

group-base

Specifies the search base for the subtree used by group searches. Use this option only when specifying the valid-groups option. The typical search base is similar to: ou=groups,dc=company,dc=com. The default value is none.

group-key

Specifies the name of the attribute in the LDAP database that specifies the group name in the group subtree. An example of a typical key is cn (common name for the group). The default value is none.

group-member-key

Specifies the name of the attribute in the LDAP database that specifies members (DNs) of a group. A typical key is member. The default value is none.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

role-key

Specifies the name of the attribute in the LDAP database that specifies a user's authorization roles. Use this option only when specifying the valid-roles option. A typical role key is authorizationRole. The default value is none.

search

Specifies the type of LDAP search that is performed based on the client's certificate. Possible values are:

cert Searches for the exact certificate.

certmap

Searches for a user by matching the certificate issuer and the certificate serial number or certificate.

user Searches for a user based on the common name found in the certificate. This is the default value.

secure

Specifies whether the system attempts to use secure LDAP (LDAP over SSL). The alternative to using secure LDAP is to use insecure (clear text) LDAP. Secure LDAP is a consideration when the connection between the BIG-IP system and the LDAP server cannot be trusted. The default value is no.

servers

Specifies a list of LDAP servers you want to search. You must specify a server when you create an SSL client certificate configuration object.

user-base

Specifies the search base for the subtree used when you select for the search option either of the values user or cert. A typical search base is: ou=people,dc=company,dc=com. You must specify a user base when you create an SSL client certificate configuration object. The default value is none.

user-class

Specifies the object class in the LDAP database to which the user must belong to be authenticated. The default value is none.

user-key
Specifies the key that denotes a user ID in the LDAP database (for example, the common key for the user option is uid). You must specify a user key when you create an SSL client certificate configuration object.

valid-groups
Specifies a space-delimited list of the names of groups to which the client must belong in order to be authorized (matches against the group key in the group subtree). The client needs to be a member of only one of the groups in the list. The default value is none.

valid-roles
Specifies a space-delimited list of the valid roles that clients must have to be authorized. The default value is none.

ltm auth ssl-crl dp

NAME

ssl-crl dp - Configures a Secure Socket Layer (SSL) Certificate Revocation List Distribution Point (CRLDP) configuration object for implementing SSL CRLDP to manage certificate revocation.

MODULE

ltm auth

SYNTAX

Configure the ssl-crl dp component within the ltm auth module using the syntax shown in the following sections.

CREATE/MODIFY

```
create ssl-crl dp [name]
modify ssl-crl dp [name]
options:
  cache-timeout [integer]
  connection-timeout [integer]
  description [string]
  servers
    [add | delete | replace-all-with] {
  [ip address ... ]
  }
  servers [default | none]
  update-interval [integer]
  use-issuer [disabled | enabled]
```

```
edit ssl-crl dp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list ssl-crl dp
list ssl-crl dp [ [ [name] | [glob] | [regex] ] ... ]
show running-config ssl-crl dp
show running-config ssl-crl dp
  [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete ssl-crl dp [name]
```

DESCRIPTION

CRLDP authentication is a mechanism for checking certificate revocation status for client connections passing through the system. This module is useful when your authentication data is stored on a remote CRLDP server.

To implement a CRLDP authentication module and create an SSL CRLDP configuration object:

1. Use the `crl dp-server` component, in the `ltm auth` module, to create a CRLDP server.
2. Use the `ssl-crl dp` component in the `ltm auth` module to configure a CRLDP configuration object that references the server you created in Step 1.
3. Use the profile component in the `ltm auth` module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the SSL CRLDP configuration object that you created in Step 2.
 - b. For the `defaults-from` option, specify a parent profile (either the default profile named `ssl_crl dp` or another custom profile that you created).

EXAMPLES

```
create ssl-crl dp my_auth_ssl-crl dp
```

Creates an SSL CRLDP configuration object named `my_auth_ssl-crl dp`.

```
delete ssl-crl dp my_auth_ssl-crl dp
```

Deletes the SSL CRLDP configuration object named `my_auth_ssl-crl dp`.

OPTIONS

`cache-timeout`

Specifies the number of seconds that CRLs are cached. The default value is 86400 (24 hours).

`connection-timeout`

Specifies the number of seconds before the connection times out. The default value is 15.

`description`

User defined description.

`glob` Displays the items that match the `glob` expression. See help `glob` for a description of `glob` expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@`[regular expression]) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`servers`

Specifies a host name or IP address for the secure CRLDP server. This option is required. The default value is none.

`update-interval`

Specifies an update interval for CRL distribution points that ensures that CRL status is checked at regular intervals, regardless of the CRL timeout value. This helps to prevent CRL information from becoming outdated before the BIG-IP system checks the status of a certificate. The default value is 0 (zero), which indicates an internal default value is active.

`use-issuer`

Specifies whether the system extracts the CRL distribution point from the client certificate. The default value is disabled.

SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm auth profile`, `ltm auth crl dp-server`, `ltm virtual`, `modify`, `regex`, `show`, `tmsh`

COPYRIGHT

BIG-IP 2016-03-14 ltm auth ssl-crl dp(1)

ltm auth ssl-ocsp

NAME

`ssl-ocsp` - Configures OCSF authentication for client traffic passing through the traffic management system.

MODULE

`ltm auth`

SYNTAX

Configure the `ssl-ocsp` component within the `ltm auth` module using the syntax shown in the following sections.

```
CREATE/MODIFY
create ssl-ocsp [name]
modify ssl-ocsp [name]
options:
  description [string]
  responders
    [add | delete | replace-all-with] {
[name]...
  }
  responders [default | none]

edit ssl-ocsp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list ssl-ocsp
list ssl-ocsp [ [name] | [glob] | [regex] ] ... ]
show running-config ssl-ocsp
show running-config ssl-ocsp
[ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete ssl-ocsp [name]
```

DESCRIPTION

Online Certificate Status Protocol (OCSP) is an industry-standard protocol that offers an alternative to a certificate revocation list when using public-key technology. To implement an SSL OCSP authentication module, you must create the following objects: one or more OCSP responder objects, an SSL OCSP configuration object, and an SSL OCSP profile.

To implement an SSL OCSP authentication module and create an SSL OCSP configuration object:

1. Use the `ocsp-responder` component in the `ltm auth` module to configure an OCSP responder object.
2. Use the `ssl-ocsp` component in the `ltm auth` module to configure an SSL OCSP configuration object to which you add the OCSP responder object that you created in Step 1.
3. Use the `profile` component in the `ltm auth` module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the SSL OCSP configuration object that you created in Step 2.
 - b. For the defaults-from option, specify a parent profile (either the default OCSP Responder profile named `ssl_ocsp` or another custom profile that you created).

EXAMPLES

```
create ssl-ocsp my_auth_ssl-ocsp

Creates an SSL OCSP configuration object named my_auth_ssl-ocsp.

delete ssl-ocsp my_auth_ssl-ocsp

Deletes the SSL OCSP configuration object named my_auth_ssl-ocsp.
```

OPTIONS

`description`
User defined description.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`
Displays the administrative partition within which the component resides.

`regex`
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`responders`
Specifies a list of OCSP responders that you configured using the `ocsp-responder` component in the `ltm auth` module.

SEE ALSO

list tacacs [[[name] | [glob] | [regex]] ...]
show running-config tacacs
show running-config tacacs [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete tacacs [name]

DESCRIPTION
Using a TACACS+ configuration object and profile, you can implement the TACACS+ authentication module as the mechanism for authenticating client connections passing through the BIG-IP Local Traffic Manager system. You use this module when your authentication data is stored on a remote TACACS+ server. In this case, client credentials are based on basic HTTP authentication (that is, user name and password).

To implement a TACACS+ authentication module and create a TACACS configuration object:

1. Use the tacacs component in the ltm auth module to configure a TACACS+ configuration object.
2. Use the profile component in the ltm auth module to create an authentication profile in which you specify the following options:
 - a. For the configuration option, specify the TACACS+ configuration object that you created in Step 1.
 - b. For the defaults-from option, specify a parent profile (either the default TACACS+ profile named tacacs or another custom profile that you created).

EXAMPLES
create tacacs my_tacacs_auth secret "This is the secret" servers add {my_tacacs_server} encryption enabled

Enables encryption for TACACS+ packets.

```
create tacacs my_tacacs_auth secret "This is the secret" servers add {
my_tacacs_server1 my_tacacs_server2 } accounting send-to-all-servers
```

Provides the ability to send accounting start and stop packets to all servers

OPTIONS
accounting
If multiple TACACS+ servers are defined and pluggable authentication module (PAM) session accounting is available, specifies where the system sends accounting start and stop packets. Possible values are:

`send-to-all-servers`
Sends to all servers.

`send-to-first-server`
Sends to the first available server.

`authentication`
Specifies when to use the secret key supplied for the secret option. This option is required. The options are:

`use-all-servers`
Use the secret key with all servers.

`use-first-server`
Use the secret key with the first available server.

`debug`
Enables syslog-ng debugging information at LOG DEBUG level. F5 Networks does not recommend this option for normal use. The default value is disabled.

`description`
User defined description.

`encryption`
Enables or disables encryption of TACACS+ packets. F5 Networks recommends this option for normal use. The default value is enabled.

`glob` Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

`partition`
Displays the administrative partition within which the component resides.

`protocol`
Specifies the protocol associated with the value specified in the service option, which is a subset of the associated service being used for client authorization or system accounting.

`regex`
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

`secret`
Sets the secret key used to encrypt and decrypt packets sent or received from the server. This option is required.

`servers`
Specifies the host name or IPv4 address of the TACACS+ server. For each server, a port may optionally be specified in the format hostname:port or IPv4:port. If no port is specified, the default port 49 is used. This option is required.

`service`
Specifies the name of the service that the user is requesting to be authenticated to use. Identifying the service enables the TACACS+ server to behave differently for different types of authentication requests. This option is required.

ltm cipher group

NAME
group - Configures a cipher group.

MODULE
ltm cipher

SYNTAX

Configure the group component within the cipher module using the syntax shown in the following sections.

```
CREATE/MODIFY
create group [name]
modify group [name]
options:
  allow { add rule1 [ rule2... ] }
  description [string]
  exclude { add rule3 [ rule4... ] }
  require { add rule5 [ rule6... ] }

edit group [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list group
list group [ [ [name] | [glob] | [regex] ] ... ]

show group [ [ [name] | [glob] | [regex] ] ... ]

DELETE
delete group [all | [name]]
options:
  recursive
```

DESCRIPTION

You can use the group component to create, modify, or delete a custom cipher group, or display a custom cipher group.

Cipher groups are contain sets of cipher rules and are attached to client-ssl or server-ssl profiles.

EXAMPLES

```
create group my_group { allow add { f5-default } }
```

Creates a group named my_group with a single allowed rule, f5-default.

OPTIONS

allow
Specifies a list of rules that are allowed in this group.

description
User defined description.

exclude
Specifies a list of rules that are excluded from this group.

require
Specifies a list of rules that are required for this group. The operation is the intersection of allow and require after all excluded rules have been removed.

SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, mv, regex, reset-stats, show, tmsb

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-11-10 ltm cipher group(1)

ltm cipher rule

NAME

rule - Configures a cipher rule.

MODULE

ltm cipher

SYNTAX

Configure the rule component within the cipher module using the syntax shown in the following sections.

```
CREATE/MODIFY
create rule [name]
modify rule [name]
options:
  cipher [string]
  description [string]
  dh-groups [string]
  signature-algorithms [string]
```

```

edit rule [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

  DISPLAY
list rule
list rule [ [ [name] | [glob] | [regex] ] ... ]

show rule [ [ [name] | [glob] | [regex] ] ... ]

  DELETE
delete rule [all | [name]]
  options:
    recursive

DESCRIPTION
  You can use the rule component to create, modify, or delete a custom
  cipher rule, or display a custom cipher rule.

  Cipher rules are gathered into cipher groups and attached to client-ssl
  or server-ssl profiles.

EXAMPLES
  create rule my_rule cipher "default"

  Creates a rule named my_rule with a cipher string "default".

OPTIONS
  cipher rule
  Specifies the OpenSSL compatible cipher string.

  description
  User defined description.

  dh-groups groups
  Specifies the allowed named groups, separated by ":". For example:
  "P256:X25519"

  The available named groups are: P256, P384, X25519 A special
  keyword, DEFAULT, represents the recommended set of named groups.

  signature-algorithms signature algorithms
  Specifies the allowed signatures algorithms, separated by ":". For
  example: "RSA_PKCS1_SHA256:ECDSA_P256_SHA256"

  The available signature algorithms are: DSA-SHA1, DSA-SHA256,
  DSA-SHA384, DSA-SHA512, ECDSA-SHA1, ECDSA-SHA256, ECDSA-SHA384,
  ECDSA-SHA512, RSA-PKCS1-SHA1, RSA-PKCS1-SHA256, RSA-PKCS1-SHA384,
  RCS-PKCS1-SHA512, RSA-PSS-SHA256, RSA-PSS-SHA384, RSA-PSS-SHA512

  A special keyword, DEFAULT, represents the recommended set of
  signature algorithms.

```

ltm classification application

```

NAME
  application - Configures a custom classification application.

MODULE
  ltm classification

SYNTAX
  Configure the application within the ltm classification module using
  the syntax shown in the following sections.

  CREATE/MODIFY
create application [name]
  options:
    app-service [[string] | none]
    description [string]
    application-id [integer]
    category [name]

  modify application [name]
  options:

```

```

    app-service [[string] | none]
    description [string]
    category [name]

edit application [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

  DISPLAY
  list application
  list application [ [all] | [name] ]
  show running-config application
  show running-config application [ [all] | [name] ]
    options:
      all-properties
      non-default-properties
      one-line
      partition

  DELETE
  delete application [name]

    Note: All referring classification-filters (to this application) need
    to be deleted first; otherwise an error will be reported. Predefined
    applications cannot be deleted.

DESCRIPTION
  You can use the application component to create, modify, delete, and
  display classification application.

EXAMPLES
  create application my_app { application-id 8192 category my_cat }

  Creates a new application named my_app.

  modify application my_app { category Web description "My description."
  }

  Modify an application named my_app.

  list application

  Displays all created applications.

  delete application my_app

  Deletes the application named my_app.

OPTIONS
  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  description
  User defined description.

  application-id
  Identifies the application. This is set during creation and cannot
  be changed. Identifiers must be unique across predefined and user-
  defined applications. Predefined application-ids must be in
  numeric range [0, 8192), and user defined application-ids must be
  in numeric range [8192, 16384).

  category
  Refers to classification category. The referred category [name]
  should exist already; otherwise an error will be reported.

SEE ALSO
  create, modify, delete, list, show, tmsh, ltm classification

COPYRIGHT
  No part of this program may be reproduced or transmitted in any form or

  reserved.

```

BIG-IP 2016-03-14 ltm classification application(1)

ltm classification category

NAME
category - Configures a custom classification category.

MODULE
 ltm classification

SYNTAX
 Configure the category within the ltm classification module using the syntax shown in the following sections.

CREATE/MODIFY
create category [name]
 options:
 app-service [[string] | none]
 description [string]

modify category [name]
 options:
 app-service [[string] | none]
 description [string]

edit category [[[name] | [glob] | [regex]] ...]
 options:
 all-properties
 non-default-properties

DISPLAY
list category
list category [[all] | [name]]
show running-config category
show running-config category [[all] | [name]]
 options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete category [name]

Note: All referring applications/classification-filters (to this category) need to be deleted first; otherwise an error will be reported. Predefined categories cannot be deleted.

DESCRIPTION
 You can use the category component to create, modify, delete, and display classification category.

EXAMPLES
 create category my_cat

 Creates a new category named my_cat.

 modify category my_cat { description "My description." }

 Modify a category named my_cat.

 list category

 Displays all created categories.

 delete category my_cat

 Deletes the category named my_cat.

OPTIONS
 app-service
 Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

 description
 User defined description.

SEE ALSO
 create, modify, delete, list, show, tmsh, ltm classification

BIG-IP 2016-11-10 ltm classification category(1)

ltm classification ce

NAME

CE - Classification Engine configuration.

MODULE
ltm classification

SYNTAX
Configure the Classification Engine settings (AKA preset) within the ltm classification module using the syntax shown in the following sections.

CREATE/MODIFY
create ce [name]
modify ce [name]
options:
app-service [[string] | none]
allow-reclassification [on | off]
analyze-dns [on | off]
analyze-ssl-serverside [on | off]
flow-bundling [on | off]
cache-results [on | off]
policies [add | delete | default | replace-all-with | none]

DISPLAY
list ce [name]
show running-config ce [name]
options:
all-properties
non-default-properties
one-line

DELETE
delete ce [name]

DESCRIPTION
Use this command to create, modify, display, or delete an Classification Engine configuration.

EXAMPLES
create ce my_ce { allow-reclassification on flow-bundling on cache-
results off }
Creates a new Classification Engine configuration named my_ce.
modify ce my_ce { cache-results on allow-reclassification off }
Turn Cache Results on and turn flow reclassification off on my_ce
preset
list ce
Displays all Classification Engines configurations.
delete ce my_ce
Deletes the Classification Engine configuration named my_ce.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
description
User defined description.
allow-reclassification
Specifies that connection ("flow") allowed to be reclassified, i.e. classification result could be changed.
analyze-dns
Allows classification engine to perform extended analysis of DNS traffic providing extended classification result.
analyze-ssl-serverside
Enables classification engine to process SSL Server Side Hello to inspect ALPN (mostly for HTTP2 / SPDY subclassification).
flow-bundling
Enables / disables flow correlation mechanism (e.g. FTP and FTP-data protocols).
cache-results
Enables / Disables classification result caching.
policies
Specifies a LTM policy that you have configured previously, if you want to configure custom signatures.

SEE ALSO
create, modify, delete, list, show, tmsh, ltm profile classification, ltm policy

COPYRIGHT

ltm classification signature-definition

NAME
signature-definition - Configure status for classification signature updates.

MODULE
ltm classification

SYNTAX
Configure the signature-definition component within the ltm classification module using the syntax in the following sections.

DISPLAY
list signature-definition
list signature-definition [[name] | [glob] | [regex]]
options:
all-properties
non-default-properties
one-line
recursive
last-attempt-automatic-mode [enabled | disabled]
last-attempt-datetime [date]
last-attempt-user [string]
last-update-automatic-mode [enabled | disabled]
last-update-datetime [date]
last-update-user [string]
message [string]
progress-status [none | success | failure | in-progress]

DESCRIPTION
You can use the signature-definition component to configure the status for classification signature updates.

EXAMPLES
list signature-definition

Displays classification signature update status configuration.

OPTIONS
last-attempt-automatic-mode
Indicates whether the last attempt to update the signature file was done manually or automatically by the system.

last-attempt-datetime
Indicates the date and time of the last attempt to update the signature file.

last-attempt-user
Indicates the user who is the last one to attempt to update the signature file.

last-update-automatic-mode
Indicates whether the last successful signature file update was done manually or automatically by the system. The value of the last-update-automatic-mode may be different from the value of the last-attempt-automatic-mode if the last update attempt fails.

last-update-datetime
Indicates the date and time of the last successful signature file update. The value of the last-update-datetime is different from the value of the last-attempt-datetime if the last update attempt fails.

last-update-user
Indicates the user who did the last successful signature file update. The value of the last-update-user may be different from the value of the last-attempt-user if the last update attempt fails.

message
Indicates the error message when it fails to attempt to update the signature file.

progress-status
Indicates the progress status when attempting to update the signature file. The options are none, success, failure, and in-progress.

SEE ALSO
list, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 20ltm0classification signature-definition(1)

ltm classification signature-update-schedule

NAME
signature-update-schedule - Configure schedule for classification signature updates.

MODULE
ltm classification

SYNTAX
Configure the signature-update-schedule component within the ltm classification module using the syntax in the following sections.

MODIFY
modify signature-update-schedule [name]
options:
[auto-update-enabled | auto-update-disabled]
auto-update-interval [daily | weekly | monthly]

edit signature-update-schedule [name]
options:
all-properties
non-default-properties

DISPLAY
list signature-update-schedule
list signature-update-schedule [[name] | [glob] | [regex]]
options:
all-properties
non-default-properties
one-line
recursive

DESCRIPTION
You can use the signature-update-schedule component to configure schedule for classification signature updates.

EXAMPLES
list signature-update-schedule
Displays classification signature update schedule configuration.
modify signature-update-schedule auto-update-enabled auto-update-interval daily
Updates the scheduler for classification signature updates to run once a day.
modify signature-update-schedule auto-update-disabled
Disables the scheduler and allows signatures to update via the browser-based Configuration utility only.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
auto-update-disabled
Specifies that the updates scheduler is disabled. The user can update the classification signatures using the browser-based BIG-IP Configuration utility.
auto-update-enabled
Specifies that the updates scheduler is enabled.
auto-update-interval
Specifies the auto-update frequency for classification signatures. This attribute will only apply in case auto update is enabled. The default value is weekly.

SEE ALSO
list, modify, tmsh

ltm classification signature-version

NAME
signature-version - Display classification signature version.

MODULE
ltm classification

SYNTAX
Display the signature-version component within the ltm classification module using the syntax in the following sections.

DISPLAY
list signature-version
options:
all-properties
non-default-properties
one-line
recursive

DESCRIPTION
You can use the signature-version component to display versions in classification signature updates.

EXAMPLES
list signature-version

Displays classification signature version configuration.

OPTIONS

cec-filename
Indicates the cec library filename in the last updated classification signature.

cec-version
Indicates the cec library version in the last updated classification signature.

classification-version
Indicates the classification version in the last updated classification signature.

conf-filename
Indicates the configuration filename in the last updated classification signature.

conf-version
Indicates the configuration version in the last updated classification signature.

im-version
Indicates the im version in the last updated classification signature.

qm-protocols-filename
Indicates the qosmos protocols filename in the last updated classification signature.

qm-protocols-version
Indicates the qosmos protocols version in the last updated classification signature.

update-time
Indicates the update time in the last updated classification signature.

SEE ALSO

ltm classification signatures

NAME
signatures - Manages classification engine signatures.

MODULE
ltm classification

SYNTAX
load signatures file [filename]
Loads classification signatures from a signature update file.
load signatures default
Resets classification engine and signatures to the factory defaults.

DESCRIPTION
You can use the signatures component to load the classification signatures from a file. Only admins can run this command.

You can obtain the latest signature update file (*.im) (if one is available) from <http://downloads.f5.com>.

For the filename, if no absolute path is specified, the default path /var/libdata/dpi/im/ is used.

Use load signatures default to discard and remove any installed upgrades and reset the classification engine and signatures to factory defaults. No user-created signatures will be deleted. By keeping the *.im file, you will be able to re-apply the update any time later using the load signatures file command.

EXAMPLES
load signatures file my_sig_file.im

Loads signatures from file "my_sig_file.im" under the folder: /var/libdata/dpi/im/.

load signatures file /var/tmp/new_sig_file.im

Loads signatures from file "new_sig_file.im" under the folder: /var/tmp/.

ltm classification stats application

NAME
application - Displays and resets classified application statistics.

MODULE
ltm classification stats

SYNTAX
Display statistics for the application component within the ltm classification stats module using the syntax in the following section.

DISPLAY
show application
option:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DESCRIPTION
You can use the application component to display classification application statistics. The statistics details are described below:

Name Specifies the number of the classified application.

Count
Specifies a number of classified flows or transactions (in transaction mode) to specific application.

LTM Policy
Specifies the number of classification decisions by LTM Policy

(cpm).

Classification Engine
Specifies the number of classification decisions by classification engine (CEC).

Qosmos iXengine
Specifies the number of classification decisions by Qosmos iXengine (ixe).

Cache
Specifies the number of classification decisions by Results Cache.

URI Parameter
Specifies the number of classification decisions by evaluating HTTP URI query string classification parameter.

HTTP Header
Specifies the number of classification decisions by using HTTP classification header.

iRule
Specifies the number of classification decisions by iRule.

Bytes in
Specifies the bytes in of the classified application.

Bytes out
Specifies the bytes out of the classified application.

Packets in
Specifies the packets in of the classified application.

Packets out
Specifies the packets out of the classified application.

You can reset the classification application statistics using reset-stats command.

EXAMPLES

show application

Displays the classified application statistics.

reset-stats application

Resets the classified application statistics.

OPTIONS

For information about the options that you can use with the command show, see help show.

SEE ALSO

reset-stats, show, tmsh

ltm classification stats url-category

NAME
url-category - Displays and resets classified url-category statistics.

MODULE
ltm classification stats

SYNTAX
Display statistics for the url-category component within the ltm classification stats module using the syntax in the following section.

DISPLAY
show url-category
option:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DESCRIPTION
You can use the url-category component to display classification url-category statistics. The statistics details are described below:

Name Specifies the number of the classified url-category.

Count
Specifies a number of classified flows or transactions (in transaction mode) to specific url-category.

iRule
Specifies the number of url-categorization decision by iRule.

Customdb
Specifies the number of url-categorization decision by custom url database.

wrdb
Specifies the number of url-categorization decision by webroot database.

Bytes in
Specifies the bytes in of the classified url-category.

Bytes out
Specifies the bytes out of the classified url-category.

Packets in
Specifies the packets in of the classified url-category.

Packets out
Specifies the packets out of the classified url-category.

You can reset the classification url-category statistics using reset-stats command.

EXAMPLES

show url-category
Displays the classified url-category statistics.

reset-stats url-category
Resets the classified url-category statistics.

OPTIONS

For information about the options that you can use with the command show, see help show.

SEE ALSO

reset-stats, show, tmsh

COPYRIGHT

BIG-IP 2016ltm-classification stats url-category(1)

ltm classification stats urlcat-cloud

NAME

urlcat-cloud - Displays and resets URL category cloud lookup statistics.

MODULE

ltm classification stats

SYNTAX

Display statistics for the url category lookup within the ltm classification stats module using the syntax in the following section.

DISPLAY

show urlcat-cloud
option:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DESCRIPTION

You can use the urlcat-cloud component to display URL category cloud lookup statistics. The statistics details are described below:

Lookups

Specifies the number of URL look-up happened in cloud cache.

Cloud Query

Specifies the number of queries sent to the cloud. This happens if the entry is not present in cloud cache.

Cloud Response

Specifies the number of responses received from the cloud lookup. Each TMM gets a response. Hence the total is multiplied by TMM count.

Unknown
Specifies the number of unknown responses from the cloud. This means the webroot cloud does not know about the queried URL.

Entries
Specifies the number of entries present in the cloud cache. Each TMM has a copy of the cache. This number is cumulative and reset-stats does not reset this number.

Add Specifies the number of entries added to the cloud cache. If the cache is not cleared "adds" and "entries" must be the same.

Delete
Specifies the number of entries cleared from the cloud cache.

Queue Full
Specifies the number of instances that tmm could not send out a URL query.

You can reset the URL category cloud lookup statistics using reset-stats command. Reset-stats does not reset the number of entries in the cache.

EXAMPLES

```
show urlcat-cloud
```

Displays the URL category cloud lookup statistics.

```
reset-stats urlcat-cloud
```

Resets the URL category cloud lookup statistics, except the number of entries in the cache.

OPTIONS

For information about the options that you can use with the command show, see help show.

SEE ALSO

reset-stats, show, tmsh

ltm classification update-signatures

NAME
update-signatures - Run automatic update for classification signatures.

MODULE
ltm classification

SYNTAX
Run the update-signatures component within the ltm classification module using the syntax in the following sections:

RUN
run update-signatures

DESCRIPTION
You can use the update-signatures component to update the classification signatures from F5 download server. Only admins can run this command.

SEE ALSO
ltm classification signature-update-schedule, run, tmsh

ltm classification url-cat-policy

NAME

url-cat-policy - Configures an ltm classification url-cat policy. It's comprised of list of urlldb feed lists. This is deprecated since version 13.0.0. Instead of creating url-cat-policy and attaching a feedlist to it, enable the feedlist directly.

MODULE

ltm classification

SYNTAX

Configure the url-cat-policy component within the ltm classification module using the syntax in the following sections.

CREATE/MODIFY

```
create url-cat-policy [name]
modify url-cat-policy [name]
options:
  app-service [name]
  description [string]
  feed-lists [add | delete ] { [name] }
```

```
edit url-cat-policy
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list url-cat-policy [ [ [name] ] ]
show running-config url-cat-policy
show running-config url-cat-policy [ [ [name] ] ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

DISPLAY

```
delete url-cat-policy [name]
```

DESCRIPTION

You can use the url-cat-policy component to configure a shareable and reusable url categorization database feed coming from local files or download feeds. The url-cat-policy can then be enforced on the configuration object of the type: ltm virtual.

EXAMPLES

```
create ltm classification url-cat-policy POL1
feed-lists add { FL1 }
description none }
```

Creates a url-cat-policy POL1 with urlldb feeds from FL1 feed lists.

```
list url-cat-policy
```

Displays the current list of url-categorization policies contents.

OPTIONS

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

description

User defined description.

partition

Displays the administrative partition within which the component resides.

feed-lists

Adds, deletes, or replaces a feed list. Specifies a list of feed lists (see ltm classification urlldb-feed-list) against which the packet will be compared.

SEE ALSO

create, edit, list, modify, ltm classification urlldb-feed-list, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008, 2012-2015. All rights reserved.

ltm classification url-category

NAME
url-category - Configures a custom URL category.

MODULE
ltm classification

SYNTAX
Configure the url-category within the ltm classification module using the syntax shown in the following sections.

CREATE/MODIFY
create url-category [name]
options:
 app-service [[string] | none]
 description [string]
 url-category-id [integer]
 irule-event [enabled | disabled]

modify url-category [name]
options:
 app-service [[string] | none]
 description [string]
 irule-event [enabled | disabled]

edit url-category [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list url-category
list url-category [[all] | [name]]
show running-config url-category
show running-config url-category [[all] | [name]]
options:
 all-properties
 non-default-properties
 one-line
 partition

DELETE
delete url-category [name]

Note: All referring url-categorization-filters (to this url-category) need to be deleted first; otherwise an error will be reported. Predefined url-categories cannot be deleted.

DESCRIPTION
You can use the url-category component to create, modify, delete, and display classification url-category.

EXAMPLES
create url-category my_urlcat { url-category-id 28672 irule-event disabled }
Creates a new url-category named my_urlcat.
modify url-category my_urlcat { irule-event enabled description "My description." }
Modify a url-category named my_urlcat.
list url-category
Displays all created categories.
delete url-category my_urlcat
Deletes the url-category named my_urlcat.

OPTIONS
app-service
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.
description
User defined description.
url-category-id
Identifies the url-category. This is set during creation and cannot be changed. Identifiers must be unique across predefined and user-defined categories. Predefined url-category-ids must be in numeric range [24576, 28671), and user defined url-category-ids must be in numeric range [28672-32768).
irule-event
Indicates if the irule is enabled or disabled in result of the classification engine.

BIG-IP 2013-11-12 ltm classification url-category(1)

ltm classification urldb-feed-list

NAME

urldb-feed-list - Configures a feed-list to be used for URLDB file loads. A urldb-feed-list is a list of URL feeds (including local file paths) from where URLDB files are downloaded. These files contain URL categorization information.

MODULE

ltm classification

SYNTAX

Configure the urldb-feed-list component within the ltm classification module using the syntax in the following sections.

CREATE/MODIFY

```
create urldb-feed-list [name]
modify urldb-feed-list [[name] | all]
options:
  default-url-category [name]
  url [string]
  poll-interval [integer]
  user [string]
  password [string]
  app-service [name]
  description [string]
```

```
load urldb-feed-list [[name] | all]
```

DISPLAY

```
list urldb-feed-list [[name] | all | [property]]
show running-config urldb-feed-list [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

DELETE

```
delete urldb-feed-list [[name] | all]
```

DESCRIPTION

You can use the urldb-feed-list component to define reusable lists of feeds. You can use a feed list in an ltm classification url-cat-policy.

EXAMPLES

```
create urldb-feed-list FL1 { url
file:///shared/images/custom_urldb_1.txt }
```

Creates a new feed list, "FL1" with URL category information in the file specified by url.

OPTIONS

create

Creates a new feed list.

delete

Deletes the feed list that you specify next, in curly braces ({}).

file

DEPRECATED since version 11.7.0. Specifies the file object containing the URLDB information.

url Specifies the url to fetch the file containing the URLDB information.

default-url-category

The URL category to be used for all the URLs specified in the URLDB file.

poll-interval

Specifies the time interval in seconds at which the url needs to be polled.

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

description
User defined description for this feed list.

partition
Displays the administrative partition within which the component resides.

SEE ALSO

edit, list, modify, ltm classification, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03 ltm classification urldb-feed-list(1)

ltm classification urldb-file

NAME
urldb-file - Manages a custom URLDB file

MODULE
ltm classification

SYNTAX
List the urldb-file component within the ltm classification module using the syntax in the following sections.

CREATE
create urldb-file [name]
options:
source-path [string]
app-service [name]

DEPRECATED: create command is deprecated from version 12.0.0. Though this command is visible, this is not meant to be used by the users. The daemons use it internally.

DISPLAY
list urldb-file [[name] | all | [property]]
show running-config urldb-file [[name] | all | [property]]
options:
all-properties
one-line
partition

DELETE
delete urldb-file [[name] | all]

DEPRECATED: delete command is deprecated from version 12.0.0. Though this command is visible, this is not meant to be used by the users. The daemons use it internally.

DESCRIPTION

You can use the urldb-file component to create, the custom URLDB file in versions before 11.7.0. The urldb-file is created internally using the URL specified in ltm classification urldb-feed-list in later versions.

EXAMPLES

```
create urldb-file FILE1 { source-path
file:/shared/images/custom_urldb_1.txt }
```

Creates a new urldb file object, "FILE1" from the source file /shared/images/custom_urldb_1.txt

Create works in versions before 11.7.0. Has been deprecated in later versions

```
list urldb-file [fileobj-name]
```

Lists the attributes of urldb file object, "FILE1" from the source file /shared/images/custom_urldb_1.txt

OPTIONS

create
Creates a new file object for custom urlcat db.

delete

Deletes the file object that you specify next, in curly braces ({}).

source-path

Specifies the location from where the URLDB file object sources the file.

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

description

User defined description for this feed list.

partition

Displays the administrative partition within which the component resides.

SEE ALSO

edit, list, ltm classification, tmsh

ltm clientssl-proxy cached-certs

NAME

cached-certs - Displays and deletes SSL Forward Proxy cached certificates and OSCP responses on the BIG-IP(r) system.

MODULE

ltm clientssl-proxy

SYNTAX

Use the cached-certs component within the ltm.clientssl-proxy module to manage connections using the following syntax.

DISPLAY

show cached-certs

options:

virtual [name]

clientssl-profile [name]

DELETE

delete cached-certs

options:

virtual [name]

clientssl-profile [name]

DESCRIPTION

You can use the cached-certs component to display or delete SSL Forward Proxy cached certificates based on a specified clientssl profile.

OPTIONS

virtual

Specifies the name of the virtual server that you want to display or delete cached certificates from.

clientssl-profile

Specifies the name of the clientssl profile that belongs to the virtual selected.

SEE ALSO

delete, show, tmsh

COPYRIGHT

BIG-IP 2017-01-21 ltm clientssl-proxy cached-certs(1)

ltm clientssl ocsf-stapling-responses

NAME
ocsp-stapling-responses - Deletes the cached OCSP responses on the BIG-IP(r) system.

MODULE
ltm clientssl

SYNTAX
Use the ocsf-stapling-responses component within the ltm.clientssl module to manage connections using the following syntax.

DELETE
delete ocsf-stapling-responses
options:
 virtual [name]
 clientssl-profile [name]

DESCRIPTION
You can use the ocsf-stapling-responses component to delete the cached OCSP responses based on a specified clientssl profile.

OPTIONS
 virtual
 Specifies the name of the virtual server that you want to display or delete cached certificates from.

 clientssl-profile
 Specifies the name of the clientssl profile that belongs to the virtual selected.

SEE ALSO
delete, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014ltm-clientssl ocsf-stapling-responses(1)

ltm data-group external

NAME
external - Configures an external class.

MODULE
ltm data-group

SYNTAX
Configure the external data-group within the ltm data-group module using the syntax shown in the following sections.

CREATE/MODIFY
create external [name]
modify external [name]
options:
 app-service [[string] | none]
 description [string]
 external-file-name [[file name] | none]
 separator [string]
 source-path [URL]
 type [integer | ip | string]

edit external [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

DISPLAY
list external
list external [[[name] | [glob] | [regex]] ...]
show [name] external-records
show running-config external
show running-config external [[[name] | [glob] | [regex]] ...]

options:
all-properties
non-default-properties
one-line
partition

DELETE
delete external [name]

DESCRIPTION

Data groups are lists of data that you define and use with iRules(r) operators. External data group records are stored in external files that you manage through the sys file data-group component. Note that external data groups can be very large, which is one reason why the groups are saved to external files. For example, a phone company may store a list of thousands of phone numbers in an external data group.

You should consider using an internal data group when the number of records is expected to be small.

An external data group acquires its type from the associated data-group file, which can be a list of IP addresses, strings, or integers.

External data groups are lists that specify:

- o A data-group file where records are stored
- o A description of the class

There are two ways to configure the external data-group object:

- o Create external data-group object, and then specify the source-path and type of the external-file. In one step the external-file will be created within the sys file data-group module and external data-group within the ltm data-group module.
- o Create an external-file within the sys file data-group module, and then create external data-group within the ltm data-group module. See help sys file data-group for information on creating the data-group file.

EXAMPLES

```
create external ext-dg1 external-file-name string.dat description  
"created for rule xyz"
```

Creates an external data group named ext-dg1, with the given description. The records for the data group are loaded from the data-group file string.dat previously created in the sys file data-group component.

```
create external ext-dg1 description "created for rule xyz" source-path  
http://file-server/data-groups/ip.class type ip
```

Downloads the data-group file from the given URL into file-store and creates a data-group file named ext-dg1 within the sys file data-group module. Creates an external data group named ext-dg1, with the given description. The records for the data group are loaded from the data-group file ext-dg1.

```
create external ext-dg2 source-path file:/shared/save/Test.dat type  
string
```

Creates a data-group file named ext-dg2 within the sys file data-group module. Creates an external data group named ext-dg2. The records for the data group are loaded from the data-group file ext-dg2.

```
modify external ext-dg2 description "created for rule abc" source-path  
file:/shared/save/Test2.dat
```

Downloads the file from the given URL into file-store and updates the source-path of data-group file referenced by external data group ext-dg2. Modifies the description of external data group ext-dg2.

```
delete external ext-dg1
```

Deletes the external data group named ext-dg1. Note: the data-group file referenced by ext-dg1 is not deleted at this time. If needed, it should be deleted under sys file data-group component.

show external ext-dg1 external-records Shows a sorted list of external data group records. Note: We recommend against displaying data-groups of over two million records due to control-plane resource constraints.

OPTIONS

app-service
Specifies the name of the application service to which the data group belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the data group. Only the application service can modify or delete the data group.

description
User defined description.

external-file-name
Specifies the data-group file where the records are stored.

Note: Only source-path or external-file-name may be specified for external data-group configuration item.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

separator

Specifies a separator to use when defining the data group. The default value is :=.

source-path [URL]
This optional attribute takes a URL.

Note: Only source-path or external-file-name may be specified for external data-group configuration item, for example:

```
source-path http://file-server/data-groups/AUL_1.cls
```

```
source-path https://file-server/data-groups/CNN.x
```

```
source-path  
ftp://username:password@server/data-groups/latest.class
```

```
source-path file:/shared/save/Test.dat
```

type Specifies the kind of data in the group. This option is acquired from the data group file. If the external data group is created with external-file that was previously created within the sys file data-group module, then type option cannot be modified. If the external data group is created with source-path option, then type should be specified. The value for type could be integer or ip or string.

SEE ALSO

create, delete, edit, glob, list, modify, regex, tmsh

COPYRIGHT

BIG-IP 2016-08-04 ltm data-group external(1)

ltm data-group internal

NAME
internal - Configures an internal class.

MODULE
ltm data-group

SYNTAX
Configure the internal data-group within the ltm data-group module using the syntax shown in the following sections.

```
CREATE/MODIFY  
create internal [name]  
options:  
  app-service [[string] | none]  
  description [string]  
  records [add | delete | modify | replace-all-with] {  
    [record key] {  
      data [value]  
    }  
  }  
  records none  
  type [integer | ip | [string] ]  
  
modify internal [name]  
options:  
  app-service [[string] | none]  
  description [string]  
  records [add | delete | modify | replace-all-with] {  
    [record key] {  
      data [value]  
    }  
  }  
  records none  
  
edit internal [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  
DISPLAY  
list internal  
list internal [ [ [name] | [glob] | [regex] ] ... ]  
show running-config internal  
show running-config internal [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition
```

DESCRIPTION

Data groups are lists of data that you define and use with iRules(r) operators. Consider using an external data group if the number of records is expected to be large.

The BIG-IP(r) system includes a number of predefined lists that you can use. They are:

- o aol
- o default_accept_language
- o images
- o private_net

The above lists are located in the file /config/profile_base.conf. When you run the load command, the system loads these lists; however, unless you have modified the lists, the system does not save the lists to the bigip.conf file.

The internal data groups are stored in the bigip.conf file.

Internal data groups can be one of three types:

- o A list of IP addresses
- o A list of strings
- o A list of integers

Strings must be surrounded by quotation marks. Numbers can be either positive or negative. These groups define the type of data in the class, which can be IP addresses, strings, or integers>

EXAMPLES

```
create internal MyDG records add { 10.0.0.0 } type ip
```

Creates an internal data group named MyDG that contains a single IP address.

```
create internal DG2 records add { 192.1.1.255 192.2.1.255 192.3.1.255 } type ip
```

Creates an internal data group named DG2 that contains a list of three network addresses: 192.1.1.0/24, 192.2.1.1/24, and 192.3.1.1/24.

```
create internal MyDG records add { my_key { data my_value } } type string
```

Creates an internal data group named MyDG that contains a single name/value pair.

OPTIONS

app-service

Specifies the name of the application service to which the data group belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the data group. Only the application service can modify or delete the data group.

description

User defined description.

records

Configures the data in the group.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

type Specifies the kind of data in the group. The default value is ip.

This option is required by the command create.

SEE ALSO

BIG-IP 2012-12-21 ltm data-group internal(1)

NAME
default-node-monitor - Configures the default node monitor for the Local Traffic Manager.

MODULE
ltm

SYNTAX
Configure the default-node-monitor component within the ltm module using the syntax shown in the following sections.

CREATE/MODIFY
modify default-node-monitor
options:
rule [rule syntax]

edit default-node-monitor
options:
all-properties

DISPLAY
list default-node-monitor
show running-config default-node-monitor
options:
one-line
all-properties

DESCRIPTION
You can use the default-node-monitor component to modify the default monitor that the system applies to any node address to which a monitor is not explicitly assigned.

EXAMPLES
modify default-node-monitor rule icmp

Modifies the global default node monitor to use the rule ICMP.

list default-node-monitor

Displays the properties of the global default node monitor.

OPTIONS
rule Specifies the rule that the system applies to any node that has not been assigned a monitor rule. The default value is none.

You can specify:

- o A single monitor, for example, modify default-node-monitor rule icmp.
- o Multiple monitors, for example, modify default-node-monitor rule icmp and tcp_echo.
- o A minimum number of monitors, for example, modify default-node-monitor rule min 1 of { icmp and tcp_echo }.

SEE ALSO

ltm dns analytics global-settings

NAME
global-settings - Configures the global settings of all DNS listeners on the BIG-IP(r) system.

MODULE
ltm dns analytics

SYNTAX
Configure the global-settings DNS listeners within the ltm dns analytics module using the syntax in the following sections.

MODIFY
modify global-settings
options:
collect-client-ip [enabled | disabled]
collect-query-name [enabled | disabled]

DISPLAY
list global-settings
list global-settings
options:
all-properties
non-default-properties
one-line

DESCRIPTION
You can use the global-settings component to configure and view information about the global settings of all DNS listeners.

EXAMPLES
list global-settings all-properties

Displays the global settings for the DNS listeners on the BIG-IP system.

OPTIONS
collect-client-ip
When enabled, the client IP addresses of DNS queries will be collected and stored in analytics database. The default value is enabled.

collect-query-name
When enabled, the domain names of DNS queries will be collected and stored in analytics database. The default value is enabled.

SEE ALSO
list, modify, tmsh

ltm dns cache global-settings

NAME
global-settings - Configures the global settings of all DNS caches on the BIG-IP(r) system.

MODULE
ltm dns cache

SYNTAX
Configure the global-settings DNS cache component within the ltm dns cache module using the syntax in the following sections.

CREATE/MODIFY
modify global-settings [name]
options:
cache-maximum-ttl [integer]
cache-minimum-ttl [integer]
resolver-edns-buffer-size [integer]

edit global-settings [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list global-settings
list global-settings [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties
one-line

DESCRIPTION
You can use the global-settings component to configure and view information about the global settings of all DNS caches.

EXAMPLES
list global-settings all-properties

Displays the global settings for the DNS caches on the BIG-IP system.

OPTIONS
cache-maximum-ttl
Specifies the number of seconds after which you want the BIG-IP system to re-query for resource records. This setting allows the BIG-IP system to re-query for resource records sooner than the owner of the records intended.

`cache-minimum-ttl`
Specifies the minimum number of seconds you want the BIG-IP system to cache DNS resource records. This setting allows the BIG-IP system to cache resource records longer than the owner of the records intended.

`glob` Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

`regex`
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

`resolver-edns-buffer-size [integer]`
Specifies the number of bytes you want the BIG-IP system to advertise as the EDNS buffer size in UDP queries.

SEE ALSO

edit, glob, list, modify, regex, tmsh

BIG-IP 2012-03-21 ltm dns cache global-settings(1)

ltm dns cache records key

NAME

key - Manages the DNSKEY records in the DNS caches on the BIG-IP(r) system.

MODULE

ltm dns cache records

SYNTAX

Configure the key component within the ltm dns cache records module using the following syntax.

DISPLAY

show key cache [cache name]

options:

count-only

owner [domain name]

slot [integer]

tmm [integer]

DELETE

delete key cache [cache name]

options:

owner [domain name]

EXAMPLES

show key cache resolver_cache

Displays the DNSKEY records in the cache named resolver_cache.

delete key cache v_resolver_cache

Deletes the DNSKEY records from the cache named v_resolver_cache.

DESCRIPTION

You can use the following options with the key component.

OPTIONS

cache name

Specifies a DNS cache name from which to display or delete DNSKEY records. This is a required field.

count-only

For a show command, return only a count of the number of matched records.

owner

Specifies a domain name on which to filter the DNSKEY records in the specified DNS cache for a query or deletion.

slot Specifies a slot number on a chassis that contains the specified DNS cache. This is a 1 based index.

tmm Specifies the number of the TMM that contains the specified DNS cache. Each tmm has essentially the same entries, so which tmm you choose is arbitrary. Use this option only for debugging. This is a 0 based index. If not specified, a random tmm will be used.

SEE ALSO

BIG-IP 2015-02-18 ltm dns cache records key(1)

ltm dns cache records msg

NAME
msg - Manages message records in the DNS caches on the BIG-IP(r) system.

MODULE
ltm dns cache records

SYNTAX
Configure the msg component within the ltm dns cache records module using the following syntax.

DISPLAY
show msg cache [cache name]
options:
count-only
qname [domain name]
rcode [integer]
slot [integer]
tmm [integer]

DELETE
delete msg cache [cache name]
options:
qname [domain name]
rcode [integer]

DESCRIPTION
The msg component contains full DNS messages. You can display and delete these messages.

EXAMPLES
show msg cache resolver_cache
Displays the message records in the DNS cache named resolver_cache.
delete msg cache v_resolver_cache
Deletes the message records from the DNS cache named v_resolver_cache.

OPTIONS
cache name
Specifies a DNS cache name. This is a required field.
count-only
For a show command, return only a count of the number of matched records.
qname
Specifies a domain name on which to filter the DNS messages in the specified DNS cache for a query or deletion.
rcode
Specifies the DNS return code on which to filter DNS messages in the specified DNS cache for a query or deletion.
slot
Specifies a slot number on a chassis that contains the specified DNS cache. This is a 1 based index.
tmm
Specifies the number of the TMM that contains the specified DNS cache. Each tmm has essentially the same entries, so which tmm you choose is arbitrary. Use this option only for debugging. This is a 0 based index. If not specified, a random tmm will be used.

SEE ALSO
delete, show, tmsh

ltm dns cache records nameserver

NAME
nameserver - Manages the nameserver records in the DNS cache resolvers on the BIG-IP(r) system.

MODULE
ltm dns cache records

SYNTAX
Configure the nameserver component within the ltm dns cache records

DISPLAY
show cache [cache name]
options:
address [ip address]
count-only
has-edns [yes | no]
has-lame [yes | no]
rtt-range [min:max]
slot [integer]
tmm [integer]
ttl-range [min:max]
zone-name [name]

DELETE
delete cache [cache name]
options:
address [ip address]
has-edns [yes | no]
has-lame [yes | no]
rtt-range [min:max]
ttl-range [min:max]
zone-name [name]

DESCRIPTION
You can use the nameserver component to display or delete nameserver records from a DNS cache. The maximum number of records returned is 1000; therefore, broad searches may not show all records in the cache.

EXAMPLES
show cache my_cache zone-name com ttl-range 50:500

Displays the nameserver records, in the DNS cache named my_cache, with the zone name com, where the TTLs of the records are between 50 and 500.

OPTIONS
address
Specifies the nameserver records, in the specified DNS cache, to select based on the IP address of the nameserver.

cache name
Specifies a DNS cache name. This is a required field.

count-only
For a show command, return only a count of the matched records.

has-edns
Specifies the nameserver records to select from the specified DNS cache, based on whether the nameserver is EDNS lame. An EDNS lame nameserver does not reply to EDNS queries.

has-lame
Specifies the nameserver records to select from the specified DNS cache, based on whether the nameserver is lame for one or more items.

rtt-range
Specifies the nameserver records to select from the specified DNS cache, based on RTTs within the specified range (inclusive). A missing value (:500 or 50:) defaults to the minimum or maximum, respectively.

slot
Specifies a slot number on a chassis that contains the specified DNS cache. This is a 1 based index.

tmm
Specifies the number of the TMM that contains the specified DNS cache. Each tmm has essentially the same entries, so which tmm you choose is arbitrary. Use this option only for debugging. This is a 0 based index. If not specified, a random tmm will be used.

ttl-range
Specifies the nameserver records to select from the specified DNS cache, based on TTLs within the specified range (inclusive). A missing value (:500 or 50:) defaults to the minimum or maximum, respectively.

zone-name
Specifies the nameserver records to select from the specified DNS cache, based on the specified zone name.

SEE ALSO
delete, show, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015-02-11 ltm dns cache records nameserver(1)

ltm dns cache records rrset

NAME
rrset - Manages the RRset records in the DNS cache resolvers on the BIG-IP(r) system.

MODULE
ltm dns cache records

SYNTAX
Configure the rrset component within the ltm dns cache records module using the syntax in the following sections.

DISPLAY
show cache [cache name]
options:
class [IN | CH | HS | ANY]
count-only
owner [DNS name]
slot [integer]
tmm [integer]
ttl-range [integer:integer]
type [A | AAAA | CNAME | NS | PTR | RRSIG | DNSKEY | SOA | TXT | ANY | ...]

DELETE
delete cache [cache name]
options:
class [IN | CH | HS | ANY]
owner [DNS name]
ttl-range [integer:integer]
type [A | AAAA | CNAME | NS | PTR | RRSIG | DNSKEY | SOA | TXT | ANY | ...]

DESCRIPTION
You can use the rrset component to display or delete records in the specified DNS cache. The maximum number of records returned is 1000. Broad searches might not show all records in the cache.

EXAMPLES
show cache resCache2 class IN type A ttl-range 20:5000 owner .com

Displays RRset records of type A, class IN, with TTLs between 20 and 5000, and an owner of .com.

OPTIONS
cache name
Specifies a DNS cache name. This is a required field.

class
Specifies the class of RRset records to select from the specified DNS cache.

count-only
For a show command, return only a count of the matched records.

owner
Specifies the node on which to filter the RRset records in the specified DNS cache for a query or deletion.

slot
Specifies a slot number on a chassis that contains the specified DNS cache. This is a 1 based index.

tmm
Specifies the number of the TMM that contains the specified DNS cache. Each tmm has essentially the same entries, so which tmm you choose is arbitrary. Use this option only for debugging. This is a 0 based index. If not specified, a random tmm will be used.

ttl-range
Specifies the RRset records to select from the specified DNS cache, based on TTLs within the specified range (inclusive). A missing value (:500 or 50:) defaults to the minimum or maximum, respectively.

type
Specifies the RRset records to select from the specified DNS

cache, based on the specified type. Most record types are supported.

SEE ALSO

options:
  all-properties
  non-default-properties
  one-line
show resolver
show resolver [name]
```

DELETE

```
delete resolver [name]
```

DESCRIPTION

You can use the resolver component to configure and view information about a recursive-resolving DNS cache. A resolver cache performs recursive resolution to fill its cache.

Important: When sizing caches, consider the total amount of memory available and how you wish to allocate memory for DNS caching. Note that cache sizing values are per-TMM process; therefore, a platform with eight TMMs consumes the amount of memory set for the RRset cache times eight.

EXAMPLES

list resolver myCache

Displays the properties of the recursive-resolving DNS cache myCache.

```
modify resolver myCache local-zones { { name lz.example.net records add
{ "lz.example.net 60 IN A 127.0.0.1" "www.lz.example.net 300 IN A
127.0.0.2" } } }
```

Modifies DNS cache myCache by adding a local-zone lz.example.net with 2 resource records.

OPTIONS

allowed-query-time

Specifies the time allowed for a query to stay in the queue before it is replaced by a new query when the number of concurrent distinct queries exceeds the limit. The default value is 200 milliseconds.

answer-default-zones

Specifies whether the resolver cache answers queries for default zones: localhost, reverse 127.0.0.1 and ::1, and AS112 zones. The default value is no.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

forward-zones

Adds, deletes, modifies, or replaces a set of forward zones on a DNS Cache, by specifying zone name(s). A given zone name should only use the symbols allowed for a fully qualified domain name (FQDN), namely ASCII letters a through z, digits 0 through 9, hyphen -, and period .. For example site.example.com would be a valid zone name.

A DNS Cache configured with a forward zone will forward any queries that result in a cache-miss (the answer was not available in the cache) and match a configured zone name, to the nameserver specified on the zone. If no nameservers are specified on the zone, an automatic SERVFAIL is returned. When a forward zone's nameserver returns a valid response to the DNS Cache, that response is cached and then returned to the requester.

nameservers

Adds, deletes, modifies, or replaces a set of nameservers in a forward zone on a DNS Cache. A nameserver is represented by an IP address and port in the format [IPv4:port] or [IPv6:port], for example 10.10.10.10:53 or 2001::1:ff:53, respectively.

If more than one nameserver is listed for a given forward zone, a matching query will be sent to the nameserver that is currently deemed the most responsive (based on RTTs). If no response is received within a certain window of time, the DNS Cache will resend the query to another nameserver with an increased wait window until a response is received.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

local-zones

Zones and associated resource records for which the cache will provide Authoritative responses. Default is empty. This is intended for small, simple authoritative data configurations.

The local-zone name must be fully qualified and should be the apex of the zone. The local-zone type may be one of the following: deny, refuse, static, transparent, type-transparent, or redirect. Zero or more resource records must be fully specified: name, ttl, class, type, and record data, separated by spaces, and within double quotes. For example, "www.example.net. 300 IN A 1.2.3.4".

For all local-zones types, if the DNS query matches, it is answered Authoritatively. How a non-matching query is handled depends on the local-zone type.

deny drops the query.

refuse sends a REFUSED response.

static sends either a NoData or NXDOMAIN response (includes SOA if present in local-zone).

transparent performs regular cache operation (i.e. transparent pass-through or iterative resolution) except for those query names which would result in NoData. This is the default local-zone type.

type-transparent Same as transparent but does not return NoData.

redirect returns responses with zone suffix record(s) for queries beneath that suffix. For example, a local-zone for example.com and a single A record for that name; queries for www.example.com or abc.www.example.com would return the single A record (both have

the same suffix).

max-concurrent-queries

Specifies the maximum number of concurrent distinct queries used by the resolver. A query is identified by query name, type and class. If the number of distinct queries exceeds this limit, the resolver replaces the earliest query in the queue with the new query if it has been in the queue longer than the allowed time. The default value is 1024.

max-concurrent-tcp

Specifies the maximum number of concurrent TCP flows used by the resolver. The default value is 20.

max-concurrent-udp

Specifies the maximum number of concurrent UDP flows used by the resolver. The default value is 8192.

msg-cache-size

Specifies the maximum size in bytes of the DNS message cache. The default value is 1048576.

The BIG-IP system caches the messages in a DNS response in the message cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nameserver-cache-count

Specifies the maximum number of DNS nameservers for which the BIG-IP system caches connection and capability data. The default value is 16536 entries.

randomize-query-name-case

When enabled, the resolver randomizes the case of query names. The default value is yes.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

response-policy-zones

Adds, deletes or modifies the response policy zone to be used by this DNS Cache. Only a DNS Express zone configured as a response policy zone can be added.

The query name of a recursive DNS request without DNSSEC enabled is queried against the data in the response policy zone. If a match is found, the configured response policy action is taken.

action

The action to take upon a match. nxdomain results in an NXDOMAIN response given to the client. walled-garden results in a response with a CNAME to the walled-garden zone and an A or AAAA response matching the DNS query type. The default action is nxdomain.

walled-garden

A local zone configured in this cache that contains an A and/or AAAA record. This is typically used to redirect a user that requests resolution of a name contained in the RPZ database to a local server. This local server can display a message to the user and/or record the connection. Only A/AAAA/ANY requests are redirected, a request for any other type is answered with a NoData response. If a request is received for type A or AAAA but there are no records of that type configured, a NoData response is returned instead.

root-hints

Specifies the IP addresses of DNS servers that the BIG-IP system considers authoritative for the DNS root nameservers.

Important:By default, the BIG-IP system uses the DNS root nameservers published by InterNIC.

Caution:When you add DNS root nameservers, the BIG-IP system no longer uses the default nameservers published by InterNIC, but instead uses the nameservers you add as authoritative for the DNS root nameservers.

route-domain

Specifies the route domain the resolver uses for outbound traffic. The default value is the default route domain.

rrset-cache-size

Specifies the maximum size in bytes of the resource records set cache. The default value is 10485760.

The BIG-IP system caches the supporting records in a DNS response in the resource record cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

rrset-rotate
Specifies the resource record rotation method used within cached responses. The default value is none.

none Resource record order is not modified.

query-id Resource record order is a function of the client's query id.

unwanted-query-reply-threshold
The system always rejects unsolicited replies. The default value of 0 (off) indicates the system does not generate SNMP traps or log messages when rejecting unsolicited replies.

Change the default value to monitor for unsolicited replies. This alerts you to a potential security attack, such as cache poisoning or DOS. For example, if you specify a value of 1,000,000, each time the system receives 1,000,000 unsolicited replies, it generates an SNMP trap and log message. The default value is 0 (off).

use-ipv4
When enabled, the resolver sends DNS queries to IPv4 addresses. The default value is yes.

use-ipv6
When enabled, the resolver sends DNS queries to IPv6 addresses. The default value is yes.

use-tcp
When enabled, the resolver can send queries over the TCP protocol. The default value is yes.

use-udp
When enabled, the resolver can send queries over the UDP protocol. The default value is yes.

BIG-IP 2016-03-14 ltm dns cache resolver(1)

ltm dns cache transparent

NAME

transparent - Configures a DNS cache without a resolver on the BIG-IP(r) system.

MODULE

ltm dns cache

SYNTAX

Configure the transparent DNS cache component within the ltm dns cache module using the syntax in the following sections.

CREATE/MODIFY

create transparent [name]

modify transparent [name]

options:

answer-default-zones [yes | no]

app-service [[string] | none]

description [[string] | none]

local-zones [[none] |

[{ { name [dname] type [type] records [none | add { [RR string] ... }] } ... }]]

msg-cache-size [integer]

response-policy-zones [add | delete | modify] {

[zone-name] {

action [nxdomain | walled-garden]

walled-garden [local-zone]

}

} response-policy-zones none

rrset-cache-size [integer]

rrset-rotate [none | query-id]

DISPLAY

list transparent

list transparent [[[name] | [glob] | [regex]] ...]

options:

all-properties

non-default-properties

one-line
show transparent
show transparent [name]

DELETE
delete transparent [name]

DESCRIPTION

You can use the transparent component to configure and view information about a transparent DNS cache. A transparent cache does not perform recursive resolution, but instead relies on another DNS resource for this functionality.

Important: When sizing caches, consider the total amount of memory available and how you wish to allocate memory for DNS caching. Note that cache sizing values are per-TMM process; therefore, a platform with eight TMMs consumes the amount of memory set for the RRset cache times eight.

EXAMPLES

list transparent myCache

Displays the properties of the transparent DNS cache myCache.

```
modify transparent myCache local-zones { { name lz.example.net records
add { "lz.example.net 60 IN A 127.0.0.1" "www.lz.example.net 300 IN A
127.0.0.2" } } }
```

Modifies DNS cache myCache by adding a local-zone lz.example.net with 2 resource records.

OPTIONS

answer-default-zones

Specifies whether the resolver cache answers queries for default zones: localhost, reverse 127.0.0.1 and ::1, and AS112 zones. The default value is no.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

local-zones

Zones and associated resource records for which the cache will provide Authoritative responses. Default is empty. This is intended for small, simple authoritative data configurations.

The local-zone name must be fully qualified and should be the apex of the zone. The local-zone type may be one of the following: deny, refuse, static, transparent, type-transparent, or redirect. Zero or more resource records must be fully specified: name, ttl, class, type, and record data, separated by spaces, and within double quotes. For example, "www.example.net. 300 IN A 1.2.3.4".

For all local-zones types, if the DNS query matches, it is answered Authoritatively. How a non-matching query is handled depends on the local-zone type.

deny drops the query.

refuse sends a REFUSED response.

static sends either a NoData or NXDOMAIN response (includes SOA if present in local-zone).

transparent performs regular cache operation (i.e. transparent pass-through or iterative resolution) except for those query names which would result in NoData. This is the default local-zone type.

type-transparent Same as transparent but does not return NoData.

redirect returns responses with zone suffix record(s) for queries beneath that suffix. For example, a local-zone for example.com and a single A record for that name; queries for www.example.com or abc.www.example.com would return the single A record (both have the same suffix).

msg-cache-size

Specifies the maximum size in bytes of the DNS message cache. The default value is 1048576.

The BIG-IP system caches the messages in a DNS response in the message cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help

regex for a description of regular expression syntax.

response-policy-zones
Adds, deletes or modifies the response policy zone to be used by this DNS Cache. Only a DNS Express zone configured as a response policy zone can be added.

The query name of a recursive DNS request without DNSSEC enabled is queried against the data in the response policy zone. If a match is found, the configured response policy action is taken.

action
The action to take upon a match. `nxdomain` results in an NXDOMAIN response given to the client. `walled-garden` results in a response with a CNAME to the walled-garden zone and an A or AAAA response matching the DNS query type. The default action is `nxdomain`.

walled-garden
A local zone configured in this cache that contains an A and/or AAAA record. This is typically used to redirect a user that requests resolution of a name contained in the RPZ database to a local server. This local server can display a message to the user and/or record the connection. Only A/AAAA/ANY requests are redirected, a request for any other type is answered with a NoData response. If a request is received for type A or AAAA but there are no records of that type configured, a NoData response is returned instead.

rrset-cache-size
Specifies the maximum size in bytes of the resource records set cache. The default value is 10485760.

The BIG-IP system caches the supporting records in a DNS response in the resource record cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

rrset-rotate
Specifies the resource record rotation method used within cached responses. The default value is `none`.

`none` Resource record order is not modified.

`query-id` Resource record order is a function of the client's query id.

  DELETE
delete validating-resolver [name]

```

DESCRIPTION

You can use the validating-resolver component to configure and view information about a validating recursive-resolving DNS cache. A resolving and validating cache performs recursive resolution to fill its cache and uses DNSSEC to ensure the integrity of the data.

Important: When sizing caches, consider the total amount of memory available and how you wish to allocate memory for DNS caching. Note that cache sizing values are per-TMM process; therefore, a platform with eight TMMs consumes the amount of memory set for the resource record set cache times eight.

EXAMPLES

```
list validating-resolver myCache
```

Displays the properties of the validating recursive-resolving DNS cache myCache.

```
modify validating-resolver myCache local-zones { { name lz.example.net
records add { "lz.example.net 60 IN A 127.0.0.1" "www.lz.example.net
300 IN A 127.0.0.2" } } }
```

Modifies DNS cache myCache by adding a local-zone lz.example.net with 2 resource records.

OPTIONS

allowed-query-time

Specifies the time allowed for a query to stay in the queue before it is replaced by a new query when the number of concurrent distinct queries exceeds the limit. The default value is 200 milliseconds.

answer-default-zones

Specifies whether the validating resolver cache answers queries for default zones: localhost, reverse 127.0.0.1 and ::1, and AS112 zones. The default value is no.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description

User defined description.

dlv-anchors

Specifies the DNSKEY or DS resource records the BIG-IP system uses to establish DNSSEC trust with a DLV registry. The resource records must be specified in string format, for example, dig or

drill format. The default is none.

forward-zones

Adds, deletes, modifies, or replaces a set of forward zones on a DNS Cache, by specifying zone name(s). A given zone name should only use the symbols allowed for a fully qualified domain name (FQDN), namely ASCII letters a through z, digits 0 through 9, hyphen -, and period .. For example site.example.com would be a valid zone name.

A DNS Cache configured with a forward zone will forward any queries that result in a cache-miss (the answer was not available in the cache) and match a configured zone name, to the nameserver specified on the zone. If no nameservers are specified on the zone, an automatic SERVFAIL is returned. When a forward zone's nameserver returns a valid response to the DNS Cache, that response is cached and then returned to the requester.

nameservers

Adds, deletes, or replaces a set of nameservers in a forward zone on a DNS Cache. A nameserver is represented by an IP address and port in the format [IPv4:port] or [IPv6:port], for example 10.10.10.10:53 or 2001::1:ff:53, respectively.

If more than one nameserver is listed for a given forward zone, a matching query will be sent to the nameserver that is currently deemed the most responsive (based on RTTs). If no response is received within a certain window of time, the DNS Cache will resend the query to another nameserver with an increased wait window until a response is received.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ignore-cd

When enabled, the system ignores the Checking Disabled setting on client queries, performs validation, and returns only secure answers. The default value is no.

key-cache-size

Specifies the maximum size in bytes of the DNSKEY cache. The default value is 1048576.

local-zones

Zones and associated resource records for which the cache will provide Authoritative responses. Default is empty. This is intended for small, simple authoritative data configurations.

The local-zone name must be fully qualified and should be the apex of the zone. The local-zone type may be one of the following: deny, refuse, static, transparent, type-transparent, or redirect. Zero or more resource records must be fully specified: name, ttl, class, type, and record data, separated by spaces, and within double quotes. For example, "www.example.net. 300 IN A 1.2.3.4".

For all local-zones types, if the DNS query matches, it is answered Authoritatively. How a non-matching query is handled depends on the local-zone type.

deny drops the query.

refuse sends a REFUSED response.

static sends either a NoData or NXDOMAIN response (includes SOA if present in local-zone).

transparent performs regular cache operation (i.e. transparent pass-through or iterative resolution) except for those query names which would result in NoData. This is the default local-zone type.

type-transparent Same as transparent but does not return NoData.

redirect returns responses with zone suffix record(s) for queries beneath that suffix. For example, a local-zone for example.com and a single A record for that name; queries for www.example.com or abc.www.example.com would return the single A record (both have the same suffix).

max-concurrent-queries

Specifies the maximum number of concurrent distinct queries used by the resolver. A query is identified by query name, type and class. If the number of distinct queries exceeds this limit, the resolver replaces the earliest query in the queue with the new query if it has been in the queue longer than the allowed time. The default value is 1024.

max-concurrent-tcp

Specifies the maximum number of concurrent TCP flows used by the resolver. The default value is 20.

max-concurrent-udp

Specifies the maximum number of concurrent UDP flows used by the resolver. The default value is 8192.

msg-cache-size

Specifies the maximum size in bytes of the DNS message cache. The default value is 1048576.

The BIG-IP system caches the messages in a DNS response in the message cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached

content, but can lower the cache hit percentage.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nameserver-cache-count
Specifies the maximum number of DNS nameservers for which the BIG-IP system caches connection and capability data. The default value is 16536 entries.

prefetch-key
When enabled, the validating resolver fetches the DNSKEY early in the validation process. Disable this setting when you want to reduce resolver traffic, but understand that a client may have to wait for the validating resolver to perform a key lookup. The default value is yes.

randomize-query-name-case
When enabled, the resolver randomizes the case of query names. The default value is yes.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

response-policy-zones
Adds, deletes or modifies the response policy zone to be used by this DNS Cache. Only a DNS Express zone configured as a response policy zone can be added.

The query name of a recursive DNS request without DNSSEC enabled is queried against the data in the response policy zone. If a match is found, the configured response policy action is taken.

action
The action to take upon a match. nxdomain results in an NXDOMAIN response given to the client. walled-garden results in a response with a CNAME to the walled-garden zone and an A or AAAA response matching the DNS query type. The default action is nxdomain.

walled-garden
A local zone configured in this cache that contains an A and/or AAAA record. This is typically used to redirect a user that requests resolution of a name contained in the RPZ database to a local server. This local server can display a message to the user and/or record the connection. Only A/AAAA/ANY requests are redirected, a request for any other type is answered with a NoData response. If a request is received for type A or AAAA but there are no records of that type configured, a NoData response is returned instead.

root-hints
Specifies the IP addresses of DNS servers that the BIG-IP system considers authoritative for the DNS root nameservers.

Important:By default, the BIG-IP system uses the DNS root nameservers published by InterNIC.

Caution:When you add DNS root nameservers, the BIG-IP system no longer uses the default nameservers published by InterNIC, but instead uses the nameservers you add as authoritative for the DNS root nameservers.

route-domain
Specifies the route domain the resolver uses for outbound traffic. The default value is the default route domain.

rrset-cache-size
Specifies the maximum size in bytes of the resource records set cache. The default value is 10485760.

The BIG-IP system caches the supporting records in a DNS response in the resource record cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

rrset-rotate
Specifies the resource record rotation method used within cached responses. The default value is none.

none Resource record order is not modified.

query-id Resource record order is a function of the client's query id.

trust-anchors
Specifies the DNSKEY or DS resource records the BIG-IP system uses to establish DNSSEC trust with a specific DNS zone. The resource records must be specified in string format, for example, dig or drill format. The default value is none.

unwanted-query-reply-threshold
The system always rejects unsolicited replies. The default value of 0 (off) indicates the system does not generate SNMP traps or log messages when rejecting unsolicited replies.

Change the default value to monitor for unsolicited DNS replies.

This alerts you to a potential security attack, such as cache poisoning or DOS. For example, if you specify a value of 1,000,000, each time the system receives 1,000,000 unsolicited replies, it generates an SNMP trap and log message. The default value is 0 (off).

use-ipv4

When enabled, the resolver sends DNS queries to IPv4 addresses. The default value is yes.

use-ipv6

When enabled, the resolver sends DNS queries to IPv6 addresses. The default value is yes.

use-tcp

When enabled, the resolver can send queries over the TCP protocol. The default value is yes.

use-udp

When enabled, the resolver can send queries over the UDP protocol. The default value is yes.

ltm dns dns-express-db

NAME

dns-express-db - Loads the DNS Express data file.

MODULE

ltm dns

SYNTAX

load dns-express-db

DESCRIPTION

The dns-express-db component within the ltm dns module is used to load the DNS Express data file /var/db/tmmdns.bin. The file is only loaded if it has been modified.

EXAMPLES

load dns-express-db

Loads the DNS Express file from disk into the running configuration.

SEE ALSO

load, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03-14 ltm dns dns-express-db(1)

ltm dns dnssec generation

NAME

generation - Configures a generation on the BIG-IP(r) system.

```

MODULE
    ltm dns dnssec

SYNTAX
    Configure the generation component within the ltm dns dnssec module
    using the syntax in the following sections.

    CREATE/MODIFY
    modify generation [name]
    options:
        app-service [[string] | none]
        expiration [date and time]
        rollover [date and time]

    edit generation [ [name] | [glob] | [regex] ] ... ]
    options:
        all-properties
        non-default-properties

    DISPLAY
    list generation
    list generation [ [name] | [glob] | [regex] ] ... ]
    options:
        all-properties
        non-default-properties
        pub-text
    show generation
    show generation [ [name] | [glob] | [regex] ] ... ]
    options:
        (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

    DELETE
    delete generation [name]

DESCRIPTION
    You can use the generation component to configure a generation.

EXAMPLES
    list generation myfirstgen

    Displays the properties of the generation named myfirstgen.

    show generation myfirstgen

    Displays the status of the generation named myfirstgen.

OPTIONS
    app-service
    Specifies the name of the application service to which this
    generation belongs. The default value is none. Note: If the
    strict-updates option is enabled on the application service that
    owns the object, you cannot modify or delete this generation. Only
    the application service can modify or delete this generation.

    expiration
    Specifies the date and time that this generation expires.

    glob Displays the items that match the glob expression. See help glob
    for a description of glob expression syntax.

    name Specifies a unique name for the component. This option is required
    for the commands create, delete, and modify.

    pub-text
    Displays public text generated by the system.

    regex
    Displays the items that match the regular expression. The regular
    expression must be preceded by an at sign (@[regular expression])
    to indicate that the identifier is a regular expression. See help
    regex for a description of regular expression syntax.

    rollover
    Specifies the date and time that this generation rolls over to a
    new generation.

SEE ALSO
    create, delete, edit, glob, list, modify, regex, show, tmsh

COPYRIGHT
    No part of this program may be reproduced or transmitted in any form or
    by any means, electronic or mechanical, including photocopying,
    recording, or information storage and retrieval systems, for any
    purpose other than the purchaser's personal use, without the express
    written permission of F5 Networks, Inc.

BIG-IP 2012-12-21 ltm dns dnssec generation(1)

NAME
key - Configures DNSSEC keys on the BIG-IP(r) system.

MODULE
ltm dns dnssec

SYNTAX
Configure the key component within the ltm dns dnssec module using the syntax in the following sections.

CREATE/MODIFY
create key [name]
modify key [name]
options:
algorithm [rsasha1 | rsasha256 | rsasha512]
app-service [[string] | none]
bitwidth [512 | 1024 | 2048 | 4096]
certificate-file [string]
description [string]
[enabled | disabled]
expiration-period [integer]
key-file [string]
key-type [ksk | zsk]
rollover-period [integer]
signature-pub-period [integer]
signature-valid-period [integer]
ttl [integer]
use-fips [external | internal | none]

edit key [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

DISPLAY
list key
list key [[[name] | [glob] | [regex]] ...]
options:
all-properties
generation
non-default-properties
one-line

DELETE
delete key [name]

DESCRIPTION
You can use the key component to configure DNSSEC zone signing and key signing keys, and to view information about the keys.

EXAMPLES
create key ksk1

Creates the key signing key, ksk1, using the system default values.

create key zsk1

Creates the zone signing key, zsk1, using the system default values.

list key my_key

Displays the properties of the DNS security key my_key.

OPTIONS
algorithm
Specifies the algorithm to use to generate the key. The default value is RSASHA1.

app-service
Specifies the name of the application service to which the key belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the key. Only the application service can modify or delete the key.

bitwidth
Specifies the length of the key you want to generate. The default value is 1024. If a key is manually managed, MCPD will derive this value from the file and override any user defined value.

certificate-file
Specifies the file containing the public key. Fields certificate-file and key-file are required for manual DNSSEC key import.

description
User defined description.

[enabled | disabled]
Specifies whether the key is enabled or disabled.

expiration-period
Specifies the life of the key in d:h:m:s, h:m:s, m:s, or seconds. At the end of the period, the system deletes the expired generation of the key. This value must be greater than the value of the rollover-period option. The difference between the two periods must be more than the value of the ttl option.

The default value is 0 (zero), which indicates unset, and thus the key does not expire.

generation
Displays the generation of the key, including the following:

creator
Hostname of BIG-IP system that created this generation.

expiration
The date and time that this generation of the key expires.

handle
The handle of a generation of a key that is used for interacting with the key subsystem (for example, HSM for FIPS).

key-tag
The hash identifier of the DNSKEY.

pub-text
The text of the randomly-generated public key.

rollover
The date and time that this generation of the key rolls over to a new key.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

key-file
Specifies the file containing the private key. Fields certificate-file and key-file are required for manual DNSSEC key import.

key-type
Specifies whether the key is of type ksk or zsk. The default value is zsk.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rollover-period
Specifies the amount of time, in d:h:m:s, h:m:s, m:s, or seconds, before the system generates another generation of the key. At the end of the period, the system creates a new generation of the key. Two generations of the key exist during the time between the end of the rollover period and the end of the expiration period.

This value must be greater than or equal to one third of the value of the expiration-period option, and less than the value of the expiration period option. The difference between the two periods must be more than the value of the ttl option.

The default value is 0 (zero), which indicates unset, and thus the key does not roll over.

signature-pub-period
Specifies the amount of time, in d:h:m:s, h:m:s, m:s, or seconds, before the system publishes another generation of the signature. At the end of the period, the system creates a new signature.

This value must be less than the value of the signature-valid-period option. The default value is 403200 seconds.

signature-valid-period
Specifies the amount of time, in d:h:m:s, h:m:s, m:s, or seconds, that the signature is valid. At the end of the period, the Global Traffic Manager no longer uses the expired signature. The default value is 604800 seconds.

ttl Specifies the amount of time, in d:h:m:s, h:m:s, m:s, or seconds, that a DNS server can cache the key. The default value is 86400.

The value of the ttl option must be less than the difference between the values of the rollover-period and expiration-period options.

0 seconds indicates that the key is not cached.

use-fips
Specifies the type of FIPS-compliant hardware security module to use when storing, and signing with, the private key. The default value is none. The choice of external attempts to use a network-attached FIPS device if configured; otherwise internal uses the FIPS device within the BIG-IP.

If this option is set to internal or external and a FIPS device is not present, the system automatically resets the value to none.

SEE ALSO

ltm dns dnssec zone

NAME
zone - Configures DNSSEC zones on the BIG-IP(r) system.

MODULE
ltm dns dnssec

SYNTAX
Configure the zone component within the ltm dns dnssec module using the syntax in the following sections.

CREATE/MODIFY
create zone [name]
modify zone [name]
options:
 app-service [[string] | none]
 description [string]
 [enabled | disabled]
 ds-algorithm [SHA1 | SHA256]
 indicate-authenticated [enabled | disabled]
 keys
 [add | delete | modify | replace-all-with] {
 [key name ...]
 }
 keys none
 nsec3-algorithm [SHA1]
 nsec3-iterations [unsigned integer]

edit zone [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties

reset-stats zone
reset-stats zone [[[name] | [glob] | [regex]] ...]

DISPLAY
list zone
list zone [[[name] | [glob] | [regex]] ...]
options:
 all-properties
 non-default-properties
 one-line
 seps

show zone [[[name] | [glob] | [regex]] ...]
options:
 (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
 global
 field-fmt

DELETE
delete zone [name]

DESCRIPTION
You can use the zone component to configure and view information about a DNSSEC zone.

EXAMPLES
list zone mySecureZone

Displays the properties of the DNSSEC zone named mySecureZone.

OPTIONS
app-service
Specifies the name of the application service to which the zone belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the zone. Only the application service can modify or delete the zone.

description
User defined description.

ds-algorithm
Specifies the hash algorithm to use when creating the Delegation Signer (DS) resource record. The default value is SHA1.

[enabled | disabled]
Specifies whether the DNSSEC zone is enabled or disabled.

Note: You must associate both a key signing and a zone signing key with the zone before complete signing of client requests can occur.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

indicate-authenticated
The Authenticated Data (AD) flag is TRUE for DNSSEC zone

authoritative answers when this setting is enabled. The default value is disabled.

keys Specifies the keys that you want to configure for the zone.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nsec3-algorithm
Specifies the hash algorithm to use when creating the Next Secure (NSEC3) resource record. The default value is SHA1. Other algorithms are not currently supported, so selecting SHA256 will revert to SHA1 with a warning message.

nsec3-iterations
Specifies the number of times to hash the Next Secure (NSEC3) names. The default value is 1."

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

seps Displays the Secure Entry Point(s) (DS and DNSKEY resource records used as client trust anchors) of the zone, including the following:

dnskey
String representation of the DNSKEY resource record.

ds String representation of the DS resource record.

generation-id
ID of DNSSEC Key Generation used to create the SEP.

key-name
Name of DNSSEC Key which was used to create the SEP.

xfr-primary-soa-serial
The learned zone SOA serial number from the primary server.

xfr-soa-serial
The advertised zone SOA serial number to all clients.

ltm dns nameserver

NAME
nameserver - Configures DNS nameservers on the BIG-IP(r) system.

MODULE
ltm dns

SYNTAX
Configure the nameserver component within the ltm dns module using the syntax in the following sections.

CREATE/MODIFY
create nameserver [name]
modify nameserver [name]
options:
address [ip address]
app-service [[string] | none]
description [[string] | none]
port [unsigned integer]
route-domain [route-domain name | none]
tsig-key [tsig-key name | none]

edit nameserver [[[name] | [glob] | [regex]] ...]
options:
all-properties
non-default-properties

reset-stats nameserver
reset-stats nameserver [[[name] | [glob] | [regex]] ...]

```

DISPLAY
list nameserver
list nameserver [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
show nameserver
show nameserver [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    global
    field-fmt

DELETE
delete nameserver [name]

DESCRIPTION
  You can use the nameserver component to configure nameservers and to
  view information about the nameservers.

EXAMPLES
  create nameserver myNameserver address 127.0.0.1 port 53

  Creates the nameserver, myNameserver, given the address and port.

  list nameserver myNameserver

  Displays the properties of the nameserver myNameserver.

OPTIONS
  address
  Specifies the IP address of the nameserver. The default value is
  127.0.0.1.

  app-service
  Specifies the name of the application service to which the
  nameserver belongs. The default value is none. Note: If the
  strict-updates option is enabled on the application service that
  owns the object, you cannot modify or delete the nameserver. Only
  the application service can modify or delete the nameserver.

  description
  User defined description.

  glob Displays the items that match the glob expression. See help glob
  for a description of glob expression syntax.

  name Specifies a unique name for the component. This option is required
  for the commands create, delete, and modify.

  port Specifies the service port of the nameserver. The default value is
  53.

  route-domain
  Specifies the route domain that the nameserver uses for outbound
  traffic. The default value is the default route domain.

  tsig-key
  Specifies the TSIG key used to communicate with this nameserver
  for zone transfers. If the nameserver is a client, then this TSIG
  key is used to verify the query and sign the response. If the
  nameserver is a transfer target for DNS Express nameserver, then
  this TSIG key should match that of the master nameserver.

  regex
  Displays the items that match the regular expression. The regular
  expression must be preceded by an at sign (@[regular expression])
  to indicate that the identifier is a regular expression. See help
  regex for a description of regular expression syntax.

SEE ALSO

ltm dns tsig-key

NAME
 tsig-key - Configures TSIG keys on the BIG-IP(r) system.

MODULE

ltm dns

SYNTAX

Configure the tsig-key component within the ltm dns module using the syntax in the following sections.

CREATE/MODIFY

```
create tsig-key [name]
modify tsig-key [name]
options:
  algorithm [ hmacmd5 | hmacsha1 | hmacsha256 ]
  app-service [[string] | none]
  description [[string] | none]
  secret [string]

edit tsig-key [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list tsig-key
list tsig-key [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

DELETE

```
delete tsig-key [name]
```

DESCRIPTION

You can use the tsig-key component to configure TSIG keys and to view information about the keys.

EXAMPLES

```
create tsig-key myKey algorithm hmacmd5 secret ABCDEFG
```

Creates the TSIG key, myKey, given the algorithm and secret (both required).

```
list tsig-key myKey
```

Displays the properties of the TSIG key myKey.

OPTIONS

algorithm

Specifies the algorithm to use to generate the key.

app-service

Specifies the name of the application service to which the TSIG key belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the TSIG key. Only the application service can modify or delete the TSIG key.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

secret

Specifies the string representation of the key's shared secret.

ltm dns zone

NAME

zone - Configures zones on the BIG-IP(r) system.

MODULE
ltm dns

SYNTAX
Configure the zone component within the ltm dns module using the syntax in the following sections.

CREATE/MODIFY

```
create zone [name]
modify zone [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  dns-express-allow-notify [add | delete | none | replace-all-with] {
    [IP Address]
  }
  dns-express-enabled [yes | no]
  dns-express-notify-action [ consume | bypass | repeat ]
  dns-express-notify-tsig-verify [yes | no]
  dns-express-server [server name | none]
  response-policy [yes | no]
  server-tsig-key [tsig-key name | none]
  transfer-clients [add | delete | none | replace-all-with] {
    [server name]
  }
}
```

```
edit zone [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
reset-stats zone
reset-stats zone [ [ [name] | [glob] | [regex] ] ... ]
```

DISPLAY

```
list zone
list zone [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
show zone [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
```

```
DELETE
delete zone [name]
```

DESCRIPTION

You can use the zone component to configure and view information about a zone.

EXAMPLES

```
list zone myZone
```

Displays the properties of the zone named myZone.

```
create zone myZone transfer-clients add { nameserver1 nameserver2 }
```

Creates a zone named myZone, which allows zone data to be transferred to nameserver1 and nameserver2.

OPTIONS

app-service
Specifies the name of the application service to which the zone belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the zone. Only the application service can modify or delete the zone.

description
User defined description.

dns-express-allow-notify
Specifies a list of IP addresses, in addition to the DNS Zone's DNS-Express Server address, which are allowed to notify the BIGIP of DNS Zone changes. A notify message coming from an IP which is neither the address of the zone's DNS Express server nor an address in this list will be dropped by the BIGIP.

dns-express-enabled [yes | no]
Specifies whether DNS Express is enabled to process queries for this zone. The default value is yes.

dns-express-notify-action [consume | bypass | repeat]
Action to take when a NOTIFY query is received for a configured zone. Options are consume, bypass, and repeat. Default is consume, meaning the NOTIFY query is seen only by DNS Express. bypass means the query will NOT go to DNS Express, but any backend DNS resource (subject to DNS profile unhandled-query-action). repeat means the NOTIFY will go to both DNS Express and any backend DNS resource. If TSIG is configured, the signature is only validated for consume and repeat actions. NOTIFY responses are assumed to be sent by the backend DNS resource, except when the action is consume and DNS Express will generate a response.

dns-express-notify-tsig-verify
Verify NOTIFY query TSIG for a DNS Express zone. Default is yes.

dns-express-server
Specifies the server from which to retrieve zone information for

DNS Express.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

Note: A successful zone transfer must occur before this zone can service DNS requests.

regex
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

response-policy
Specifies if this is a response policy zone. If this is set to yes, this zone may be assigned as an RPZ to a DNS Cache. Default is no.

server-tsig-key
Specifies the server side TSIG key associated with the DNS zone. It should match the TSIG Key associated with the master name servers.

transfer-clients
Specifies the nameservers allowed to transfer the zone from BIGIP.

SEE ALSO

Itn eviction-policy

NAME

eviction-policy - Configures eviction policies to determine when and how to terminate connections.

MODULE

ltm

SYNTAX

Configure the eviction-policy component within the ltm module using the syntax shown in the following sections.

CREATE/MODIFY

```
create eviction-policy [name]
modify eviction-policy [name]
options:
  description [string]
  app-service [[string] | none]
  low-water [integer]
  high-water [integer]
  slow-flow {
    enabled [true | false]
    eviction-type [count | percent]
    grace-period [integer]
    maximum [integer]
    threshold-bps [integer]
    throttling [enabled | disabled]
  }
  strategies {
    bias-bytes {
      delay [integer]
      enabled [true | false]
    }
    bias-idle {
      enabled [true | false]
    }
    bias-oldest {
      enabled [true | false]
    }
    low-priority-geographies {
      countries [add | delete | modify | replace-all-with] {
        [country-code] ...
      }
    }
    enabled [true | false]
  }
  low-priority-port {
```

```

```

```

show eviction-policy
show eviction-policy [ [ [name] | [glob] | [regex] ] ...]
options:
  all-properties
  default

```

DELETE

```

delete eviction-policy [name]

```

DESCRIPTION

You use the eviction policy to specify which flows to terminate when the connection limits for the box are approached. The eviction policy contains strategies which select the flows to terminate. Additionally, the eviction policy defines parameters used to determine when flows are considered to be slow. Slow flows are terminated according to the policy, even when the Big-IP is not under duress and the connection limits are not approached.

When applied to the global context, the eviction policy low-water and high-water limits are with respect to memory available on the Big-IP. When applied to a virtual server or a route domain, the limits are with respect to the connection limit on the virtual server or route domain, respectively.

It is possible to monitor slow flows, accumulating metrics on the number of flows under the designated slow flow transfer limit. To do so, enable slow-flows, but disable throttling on the slow flow.

Note: Monitoring or killing slow flows will incur a performance penalty.

Note: The strategies applied here work on a cyclic sweep of all connections on the Big-IP. These do not run at the granularity to guarantee eviction of a particular flow or type of flow, but are statistical and opportunistic.

The bias-bytes algorithm attempts to select the flows that have sent and received the fewest bytes on the connection.

The bias-idle algorithm attempts to select the flows that have been idle the longest.

The bias-oldest algorithm attempts to select the oldest flows.

The low-priority-geographies algorithm selects flows that are in low-priority geographies according to the GeoIP database loaded onto the box.

The low-priority-port algorithm selects flows that are in the provided list of low-priority ports and protocols.

The low-priority-route-domain algorithm selects flows that are in the provided list of low-priority route domains.

The low-priority-virtual-server algorithm selects flows that are in the provided list of low-priority virtual servers.

EXAMPLES

```

create eviction-policy my_eviction_policy { low-water 70 high-water 80
slow-flow { enabled true threshold-bps 50 throttling disabled }
strategies { bias-idle { enabled true } } }

```

Creates an eviction policy named `my_eviction_policy`, which accumulates statistics on the current number of slow flows but does not terminate any flows that are considered slow. The bias-idle algorithm is used to kill flows when the limits on the context are approached. The aggressive sweeper will activate at 80 percent of capacity, and deactivate when load is reduced to 70 percent of capacity.

```

modify eviction-policy my_eviction_policy { strategies { low-priority-
geographies { enabled true countries replace-all-with { AZ BZ } } } }

```

Modifies the eviction policy named `my_eviction_policy`, enabling the low-priority geography strategy and dropping flows from Azerbaijan (AZ)

and Belize (BZ).

delete eviction-policy my_eviction_policy

Deletes the eviction policy named my_eviction_policy.

OPTIONS

description

Provides a user-defined description for the policy.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

low-water

Specifies the aggressive sweeper activation threshold as a percentage of total capacity. The allowable range is 50 - 100, and the low-water value must be lower than or equal to the high-water value. To disable killing flows when limits are met or exceeded, set the low-water and high-water to 100 percent. Default value is 85 percent.

high-water

Specifies the target maximum load on the context. The adaptive reaper will be more aggressive as this limit is approached. The allowable range is 50 - 100, and the high-water value must be higher than or equal to the low-water value. To disable killing flows when limits are met or exceeded, set the low-water and high-water to 100 percent. Defaults to 95 percent.

slow-flow

Specifies whether to monitor and possibly remove flows considered to be slow.

enabled

If true, the slow-flow monitoring and possible removal are activated. If false, the remaining slow-flow attributes are unused. The default value is false.

eviction-type

Indicates whether the threshold is based on an absolute count of slow flows, or a percentage of the total flows on the context where the eviction policy is applied. There is no default value.

grace-period

Specifies the minimum age of a slow flow before the flow is killed.

maximum

Provides the count or percentage at which slow flows will be killed. If eviction-type is count, this value is the absolute number of slow flows allowed; if eviction-type is percent, this is the percentage of flows on the context that are allowed to fall under the threshold-bps before being killed.

threshold-bps

Provides the threshold under which flows are considered to be slow, in bytes per second.

throttling

Indicates whether to kill flows that are considered slow. If set to enabled, flows that fall under the threshold-bps are subject to being killed according to the defined maximum number of flows.

strategies

Defines the strategies to be used to select flows for eviction in the eviction policy.

bias-bytes

Defines how to use the bias-bytes eviction strategy.

delay

The delay allowed for new flows to transfer content, to prevent killing infant flows.

enabled

Specifies whether to use the bias-bytes algorithm. If false, the bias-bytes algorithm is not used. The default value is false.

bias-idle

Defines how to use the bias-idle eviction strategy.

enabled

Specifies whether to use the bias-idle algorithm. If false, the bias-idle algorithm is not used. The default value is false.

bias-oldest

Defines how to use the bias-oldest eviction strategy.

enabled

Specifies whether to use the bias-oldest algorithm. If false, the bias-oldest algorithm is not used. The default value is false.

low-priority-geographies

Defines how to use the low-priority geographies eviction strategy.

countries
Provides a list of country codes considered low-priority candidates to evict, based on GeoIP information.

enabled
